This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. NAVAL INVESTIGATION.

TUESDAY, MARCH 9, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met pursuant to the call of the chairman, at 10.30 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale, presiding.

Present, Senators Hale (chairman), McCormick, Pittman, and Trammell.

The CHAIRMAN. The committee will come to order. On January 17, at a meeting of this committee which was being held on the question of awards in the Navy, a letter was read from Admiral William S. Sims to the Secretary of the Navy, dated January 7, 1920, and without objection, that letter will be inserted in this record at the present time.

(The letter referred to is here printed in the record as follows:)

JANUARY 7, 1920.

From: Rear Admiral William S. Sims, United States Navy.
To: The Secretary of the Navy.
Subject: Certain naval lessons of the Great War.

1. Upon the conclusion of a war in which large naval forces have been engaged, and after a sufficient time has elapsed to permit of a careful estimate of the manner in which the war was conducted, it is of the first importance that the lessons to be derived from this experience be recorded in order that they may serve as a guide in future wars.

2. This is especially true of a naval war of such a peculiar character that the experience of former wars was of little assistance in determining the proper policy and in developing the unusual tactics that were rendered necessary by the number, geographical position and resources of the countries involved, and by the enemy's method of submarine attack upon merchant shipping in disregard of the tenets of international law and the laws of humanity.

3. In this respect it is particularly important that a just estimate be made of the errors of policy, tactics, strategy, and administration, that were committed by our Navy.

4. It is to this end that I submit the following account of what appears to me to be the most serious of these errors, and the circumstances that led up to them, followed by a brief summary of the lessons to be derived therefrom.

5. This is not presented solely from the viewpoint of the commander of our relatively small naval forces in Europe, but specifically as a result of the experience necessarily gained in the unusual and very responsible position of the Navy Departments' representative in the naval council of the Allies, where only all allied plans and policies could be continuously discussed, and where only all essential information, both current and general, was at all times available.

6. In the latter part of March, 1917, in response to a request from the American ambassador in London, expressing the desire of the British Government that a naval officer of high rank be sent to secure the closer cooperation which our Navy Department had suggested, I was ordered abroad on barely 48 hours' notice.

7. Brief orders were delivered to me verbally in Washington. No formal instructions or statement of the Navy Department's plans or policy were received at that time, though I received the following explicit admonition: "Don't let the British pull the wool over your eyes. It is none of our business pulling their chestnuts out of the fire. We would as soon fight the British as the Germans."

Digitized by Google

8. I assumed that my mission was to confer with the heads of the allied navies to learn the actual situation and to discuss means for naval cooperation in case the United States declared war against the Central Powers. A lieutenant commander accompanied me as aid. We were directed not to take uniform and to travel under assumed names, I expected to return and supplement my cables by reporting the situation in person. I had no idea that I would be designated to command the naval forces in Europe in case of war.

9. I arrived in Liverpool on April 9, and in London on April 10, 1917, and went immediately to the admiralty, where the naval situation was fully explained by the responsible officials. This explanation showed that the Navy Department did not understand the seriousness of the submarine situation; that its information was very incomplete and inaccurate. This was due to the insufficient scope of its intelligence service, very few naval officers having been sent to Europe for information before we entered the war.

10. A review of the cables sent to the department in April, 1917, shows that the situation was very serious and that the enemy was rapidly winning the war by destruction of merchant shipping. Throughout the following year numerous cables and letters of the most urgent possible character were sent with the object of impressing upon the department the vital necessity of our maximum effort being exerted in the European waters with the least possible delay, but without producing the desired results.

11. Attention was frequently invited to the fact that shipping was being sunk much faster than it was being built, and that it was a matter of simple arithmetical calculation to determine when the Allies would have to sue for peace if the rate of loss continued.

12. It may be well to state here that the delays in taking action, and the lack of support, involving the efficiency of the United States naval assistance in the war, can be fully understood only through an examination of the communications exchanged between the department and the naval headquarters abroad.

13. For some reason which has never been explained, the Navy Department, during at least the first six months of the war, failed to put into actual practice a wholehearted policy of cooperation with the Allies—the policy required for winning the war with the least possible delay.

14. The headquarters in Europe was not infrequently left in ignorance of the department's policies, plans for operation of United States forces, and its intended action upon my many dispatches. Not until July 10, 1917, did the Navy Department outline a policy as regards naval cooperation with the Allies—in a cable quoting a letter to the State Department.

15. As usual in such cases, the policy thus set forth was academically sound, but that it was not carried out, or was not understood by the department, is shown by the fact that for 10 months after its receipt I was still urgently recommending an increase of forces—still trying to convince the department that the war was in the eastern Atlantic; that the United States naval "front" was off the European coast and not off the United States coast; that it was there only that the naval enemy was operating; that it was there only that United States shipping, let alone allied shipping, could be protected with the maximum efficiency.

16. A review of the dispatches makes it apparent that the department did not accept my reports and recommendations with the seriousness that the critical situation demanded. There are many instances that illustrate this. One that may be cited is the case of our battleships that were requested as reinforcement of the Grand Fleet.

17. Following a conference with Admiral Jellicoe, then first sea lord, or "chief of naval operations," of the British Admiralty, and Admiral Beatty, the commander in chief of the Grand Fleet, it was strongly recommended, on July 21, 1917, that four of our coal-burning battleships be sent at once. There was great delay before there was even an acknowledgment of this request. This naturally subjected me to much embarrassment. The request, though repeated, was finally refused.

18. In the following November the chief of naval operations arrived in England with the Col. House mission. After discussing this question of the necessity of sending our battleships, with the same officials with whom I had discussed it, he cabled at once recommending that they be sent. The result was that it was over four months after the original request (Nov. 28), that the four ships sailed from the United States.

19. This is but one of a number of examples of a similar kind and strikingly illustrates the nature of the delays caused by the department's insistence upon trying to understand the intricate details of rapidly changing conditions 3,000 miles away. As it was, of course, a physical impossibility to keep the department fully and accurately informed, and as the department insisted upon making decisions concerning both the disposition and the actual operations of the European forces, the inevitable result was unsound decisions, and in some cases long delays before the depart-

Digitized by Google

ment was induced to accept the original recommendations that were based upon exhaustive discussions of the actual conditions with the heads of the allied navies.

20. Judging from the actions that were finally taken, after extensive cabled and written communications, and consequently long delays, it is apparent that if I could have appeared daily in Washington to explain fully my recommendations, and the discussions before the conferences upon which they were based, they would undoubtedly have been carried out from two to six months earlier. The point is that if the department considered that there was anyone in Washington more competent to form just conclusions, he should have been sent to Europe for that purpose; but, failing this, the recommendations of the Navy Department's representative, based upon conferences with the allied commanders, should have been accepted and immediately acted upon. The action of the department in this respect was a violation of a fundamental principle of warfare—see Mahan, or any authority—and it was continuous throughout the war. It added greatly to the burden of my work.

21. There was great delay and reluctance in accepting the indisputable fact, which should have been apparent to anyone, that the critical sea area was in the eastern Atlantic in the so-called submarine war zone; that the submarine campaign could be critical and could affect the ultimate decision of the war only in that area.

22. This attitude in Washington greatly slowed the sending of the necessary assistance, and necessarily resulted in prolonging the war.

23. It would seem to be self-evident that the department could not possibly have been kept completely informed in detail, by cable code messages, of the actual situation in the war zone, and, particularly, of the rapidly changing conditions during the critical period of the war in the summer of 1917.

24. As a matter of fact this was a physical impossibility during all of that most critical period. The work of collecting the necessary information, or even the purely mechanical work of transcribing it, would have been away beyond the physical capacity of one man assisted by the one aid I was allowed during that time. The best that could possibly be done was to keep the department informed by cable in a general way of the conclusions reached by the various discussions with the allied commanders at the "front," and of the decisions based thereon.

25. In cases where the department declined to approve such decisions, the only recourse was to try to explain by letter, as fully as time and insufficient assistance would permit. The result was, of course, long, embarrassing, and dangerous delays.

26. If the department had promptly accepted the recommendations made, beginning four days after my arrival abroad, and continuing for some months, and had sent at once all the destroyers and other craft which were finally sent in the next four or five months, it follows that the United States naval intervention would have been much more efficient.

27. I realize that it is difficult at the present time to believe that any policy involving such delays could have been persisted in, particularly when combined with a failure to comply with my requests for additional staff officers to assist my one aide; but a review of the dispatches and letters exchanged with the department during this period (the first four months of the war) will show that the department insisted upon the impossible, that is, upon full and detailed substantiation of every proposition advanced, even many of those concerning the disposition and handling of the naval forces in actual contact with the enemy.

28. For example, in the above-mentioned statement of policy, from the Navy to the State Department, a copy of which was sent me, it is clearly set forth that readiness completely to cooperate by sending our light forces abroad was dependent upon the condition that the Allies should keep the department fully informed through me of their plans and intentions.

29. In other words, while the department's first statement of policy (which was dated July, 1917, or three months after we entered the war) was what I had recommended since the beginning, it nevertheless withheld putting it into effect, apparently because of a conviction that the Allies were not keeping it fully informed of their plans.

30. The truth of the matter was that nothing was being withheld, and that all policies and plans which were in writing, which were actually of an official nature, and which in any way affected United States naval cooperation, had been transmitted to the department as completely as long distance communication—coded messages—permitted.

31. Certain suggestions were made by the British Admiralty as to uses of our forces in the campaign. For example, in April, 1917, there was anxiety lest the enemy should attempt a raid in the Channel with a heavy force and get away before he could be intercepted by a force from the Grand Fleet, the nearest base of which was at Rosyth, near Edinburgh. Accordingly, the Admiralty suggested that a squadron of our battleships be based on Brest or in the Channel. No reply was made to this sug-

Digitized by Google

gestion. Also, the value of submarines in the campaign was first explained April 19, 1917. None were sent until October, 1917, when five arrived in Ireland, followed by seven more in January and February, 1918.

32. In spite of the numerous messages sent in April, the only information received up to April 27, 1917, was that six destroyers only would be sent. The situation was then so very critical that I appealed to the American ambassador in London, who sent a most urgent message to the President, and on May 3, 1917, the first definite information was received of the department's intention to send more than six destroyers—that ultimately 36 and two repair ships would be sent.

33. Most earnest requests were made for tugs because of the urgent need for them in the submarine zone. These requests fully explained how many torpedoed ships could have been beached and salvaged if these tugs had been available. Experience has shown that such vessels could be repaired and put in service again in a short time—a very short time compared to that required to build new ships—thus resulting in a great saving of tonnage.

34. A year after we entered the war but four tugs had been sent, and two of these were specifically allocated to Italy by the department. Nine more were eventually sent at various times, but none before April 23, 1918.

35. The department caused serious embarrasment and delays in putting into effect the convoy system which was the most important of all the measures used in defeating the submarine war against allied shipping.

36. The department was repeatedly assured that the Allies at all times had remarkably accurate information as to the movement of submarines, and that it was practically certain that they could not reach our coast, or even leave European waters, without advance information being supplied. Subsequent events proved this assurance to be correct.

37. No submarines visited our coast until May, 1918, and the department was in all cases informed when they started across, and often as to their exact destination—where they were to lay mines, etc.

38. My dispatches show that with all possible emphasis I tried to induce the department to view the campaign as a whole; to consider our naval forces as but one relatively small item of an allied naval team; that our mission was the protection of all allied lines of communication and not the United States lines of communication alone; that, particularly in the early part of our campaign, the strictly United States lines of communication, as compared to allied lines, were inconsiderable; and that it was quite possible to give our relatively small commerce quite superior protection at the expense of losing the war by denying essential protection to the vastly greater allied commerce upon which the success of our common cause chiefly depended.

39. There was naturally a strong inclination on the part of the various powers, including the United States, to resist this policy in favor of a disposition of forces that would afford superior protection to their respective commercial vessels.

40. War is always a dangerous game. Military operations conducted by several allied powers should never be based upon a policy of "safety first" as regards the interests of any particular ally. This is especially true where success depends upon the maximum possible protection being given to the allied commerce as a whole.

41. As the possession of adequate shipping was an imperative requirement in this war, it follows that the essential policy was to pool all antisubmarine forces and use them to the best possible advantage for the protection of all shipping, regardless of the flag that it happened to be under. As the winning of the war was the paramount object, and as our antisubmarine forces and those of the Allies were always inadequate, and as it was consequently impossible to prevent a certain amount of loss, it is apparent that the game was to reduce the combined loss of allied shipping below a point which would defeat the objective of the enemy and thus insure victory of the common cause as a whole.

42. It was repeatedly explained that if we could actually entice the enemy into shifting his submarines to our coast it would be greatly to the advantage of the common cause, even granting that our shipping would suffer somewhat more severely; that the chances of the enemy shifting any of his operations to the United States coast without our having advance knowledge, while remote, was a fully justifiable risk, and therefore that such considerations should not deter us in any way from throwing every possible bit of naval strength into the fight on the actual "front"; that is, in the "war zone" in European waters. Moreover, that the risk was slight, as vessels could be sent back, if necessary, before submarines could reach our coast or could do much damage. In making long passages submarines necessarily steam at slow speed—from 5 to 6 knots.

43. Submarines attacked almost exclusively merchant vessels, thus cutting off supplies essential to the armies. This was their correct mission, and they wisely

Digitized by Google

avoided conflict with allied naval vessels. It was, therefore, our mission to adopt such tactics as to force the submarines into contact with the Allies' military vessels, while protecting the merchant shipping. This meant antisubmarine craft in such numbers that the submarines could not reach their prey without encountering them. It was for this reason that it was continuously urged that everything be sent, not only destroyers, which are preeminently the best antisubmarine craft, but also yachts, gunboats, tugs, etc., in fact, any craft that could steam across the ocean or be towed across.

44. It is quite true that there were many naval activities outside of the eastern Atlantic, such as in Caribbean, south Atlantic, Pacific, and Asiatic waters. But, considering the rapidity with which at the time in question we were losing the war in the submarine zone, these forces were of little importance—practically none as regards ultimate success. A great deal of unnecessary effort was expended in these areas. It was repeatedly pointed out that we could afford to lose some antisubmarine craft, but could not afford to continue the loss of merchantmen at the rate then being sustained.

45. It was realized, of course, that if a considerable number of antisubmarine vessels was not kept on our coast there would be risk of public criticism which, in time of war, must be based upon inadequate information, because to inform the public would be to inform the enemy. But I strongly advised that this risk be accepted; that we should not be influenced in our war measures by the possibility of such adverse criticism: that the situation made it imperative that every possible means be used to defeat the enemy as speedily as possible, regardless of other considerations, and thus save many valuable lives.

46. Perhaps the most remarkable situation disclosed by the correspondence with the department is that during the most critical period—the first four months after we entered the war—I had but one aid, and that for more than the first year I had a wholly inadequate staff.

47. With all the insistence possible it was explained, in numerous cables and letters, for four weary and anxious months, the absolute necessity of further assistance in order to handle the situation effectively, but only to receive always the same answer, namely, that officers were "not available."

48. Finally, in July, 1917, my only aid was unable longer to support the continuous strain of the past four months' work, including the very anxious task of planning for and handling the troop convoys then arriving. And it was only after this fact had been cabled that three officers were sent out, though the department still declined to provide the adequate staff that had been requested, with full explanations of the types of officers required and the necessity for each. I urged the department to give me at least the staff that the commander of one flotilla of destroyers would have in time of peace. But all in vain.

49. As it gradually became apparent that support in this matter need not be expected, I began slowly building up a staff by detaching officers from some of the ships. This was, of course, regrettable, as many of the ships were at that time short of officers; but it was necessary, on pain of the whole force becoming ineffective through the rapidly growing and essential administrative work getting beyond the capacity of the headquarters' force. Ultimately this force consisted of about 60 regular and 140 reserve officers and 1,000 enlisted men and clerical force for the administration, supply, and operation of widely dispersed forces of about 370 ships of all classes, 5,000 officers, and 75,000 men. Its necessity was finally, I believe, tacitly recognized by the department, but not until near the end of the war, when a few officers were sent for staff duty. If it had been recognized from the beginning, as well as the necessity of sending all possible antisubmarine forces, there can be no doubt that the end of the war would have been hastened and hundreds of thousands of tons of shipping and many lives would have been saved.

50. It needs little explanation to understand what I and my single aid were up against. For the efficient handling of such a difficult and complicated situation I should have had a staff capable of:

(1) Obtaining complete information of the various phases of the naval campaign which had been in operation for over two years.

(2) Keeping up to date with the developments which were rapidly changing almost from day to day.

(3) Efficiently administering, supplying, and operating the entire force.

(4) Coordinating our work with that of the allies.

51. The work of such a staff not only involved attempting to survey the disposition of all enemy forces, but also of all allied forces operating in the North Sea, Atlantic, and Mediterranean. It was also necessary to keep track of the results of the naval campaign in all its details both from the side of the Allies and from that of the enemy, and to solve the problems of supply, repairs, etc., which would affect any United

Digitized by Google

States naval forces that might be sent abroad. The above, to say nothing of having to solve problems relating to the entirely new forces introduced into this war, such as aviation—a tremendous problem in itself.

52. It would take many pages to set forth all the activities and information which were to be studied and reports of which, of course, could have been transmitted to the department if the staff had been adequate.

53. If the department realized these conditions, it is made clear by the records that it was not influenced by them. The correspondence shows that I was trying to get the department to understand that I was confronted with an impossible task—that it was actually physically impossible for me and one aid to carry on efficiently the necessary operations of the forces, let alone comply with the department's demands for the details of information concerning all the various plans of the Allies, the details of all methods and appliances used, etc. All this not to mention the details required concerning new construction, new types of vessels, new methods of gunfire, etc.

54. In a word, it would hardly be possible to conceive of a more complete misunderstanding by the department of the actual situation that confronted me on the other side, particularly during the critical period of the war.

55. On a number of occasions I invited the department's attention to the fact that it was impossible intelligently to direct the operation of our forces from Washington; that if we were to cooperate with the allied navies, which was the only efficient way of participating in the war, it was essential that we keep in close personal touch with the heads of the allied navies in the war area.

56. To this end it was pointed out that our organization abroad should be considered as the department's advance headquarters in the field, similar to the general headquarters of the Army in the field; that the personnel of the organization at these advance headquarters should be more than adequate rather than inadequate, in order to avoid the great danger of basing the Navy's part in the war upon incomplete information.

57. When Gen. Pershing arrived in Europe in May, 1917, he was accompanied by a nucleus staff, consisting of 5 colonels, 6 lieutenant colonels, 16 majors, 18 captains, and 8 lieutenants, or 53 commissioned officers in all, besides many writers and orderlies. Ultimately this staff was expanded to about 1,500 commissioned officers.

58. As was repeatedly pointed out, such was the necessity for an adequate organization abroad that the term "not available" should have been applied to other activities of vastly less importance; that the headquarters organization abroad, as well as that in Washington, should be adequate, even if it meant laying up a couple of old ships, especially those of a class which could not possibly be used in the war.

59. The policy indicated by the dispatches in question may be summed up by the statement that ships as well as troops in the field, no matter what their individual skill, would be very heavily handicapped if their combined efforts were not coordinated and directed from the most central source of all available information.

60. The department frequently omitted to keep its naval representative abroad informed of its plans, intentions, and sometimes even the movements of forces in the European area, and there was at times embarrassment caused by lack of general information concerning the Navy's activities in other areas, such as the South Atlantic, Pacific, etc. As foreign forces and shipping were also operating in those areas, it was embarrassing not to be able to answer in conference with the Allies all questions concerning our actual naval activities as well as prospective plans, the carrying out of which would necessarily influence allied plans.

61. It requires little imagination to understand the great embarrassment of my position. It was, of course, impossible even to attempt any explanation of the evident fact that the Allies were not receiving the easily possible naval support in ships and that I was not receiving adequate assistance in personnel.

62. Apart from the resulting lack of coordination, it was very difficult—I fear sometimes impossible—to avoid the impression conveyed thereby to the heads of the allied navies that I was not being supported or was not in the confidence of the department.

63. Delays and confusion were caused by the department's dealing directly from Washington with European naval officials in Europe without using its own representatives there to investigate conditions at the "front," discuss all details with the allied navies, and thus coordinate effort.

64. For example, on May 8, without previous explanation, the department announced its intention to establish naval bases at Bordeaux and Brest, although on May 5, it had been informed of the results of a conference with the Fernch naval authorities and their agreement that our forces should remain concentrated at that time in the area of greatest enemy activity.

Digitized by Google

65. Delays and confusion were also caused by dealing with representatives of foreign countries stationed in America, who made independent and strenuous demands for ships, coal, and other supplies, etc., without reference to the demands or necessities of others. The department thus ignored its own representative who was manifestly abroad for the paramount purpose of investigating the details of all such requests, and determining, after conferences with the allied navies, their relative merits, and particularly their relation to the necessities of the antisubmarine campaign.

66. I realized, of course, that a correct policy would have placed a heavy responsibility upon me, but as it was impossible to decide such questions efficiently and rapidly without access to all the information, and without opportunity for personal conferences, either this policy should have been adopted or else the person or persons in Washington assumed to be competent to decide such matters from a distance should have been transferred permanently to headquarters in Europe where personal contact, all available information, and continuous conferences would have been possible.

67. It is essential clearly to understand the vital importance of continuous conference with those officials of the allied navies and Governments who were directly concerned that nothing should be neglected to render decisions sound.

68. In many cases such was the mass of details involved in a decision—not only the details of the actual situation, but those based upon actual experience in similar cases and discussed at former conferences—that it was, of course, impossible for officers sent abroad to attend special conferences to acquire this information in time to make use of it. The almost inevitable result in such cases would be unsound opinions presented by them at the conferences.

69. There was insistence by the department upon finding new naval plans—a royal road to victory—such as blocking the enemy in his ports. The objection to radically new plans was that the situation was critical and their preparation would delay striking quickly with all available forces. This insistence assumed that the department, incompletely informed as it necessarily was, and without previous experience in the war, was more competent to decide upon practicable plans than their own representative in continuous conference with the leaders of the allied navies who had had nearly three years' experience. This attitude was maintained until after the commander in chief of the Atlantic Fleet and the Chief of Naval Operations had visited Europe and learned something of the situation.

70. During the first year of the war the department refused to permit me to enroll in the Naval Reserve capable Americans who had special knowledge and who offered their services. Many of these men possessed special European experience which could not be obtained at home. Some of them felt so impelled to do their part that they actually returned to the United States in order that they might be enrolled there.

71. Throughout the war the department refused to trust to my discretion in the promotion of reserve officers, both for gallantry in action with the enemy and for conspicuous ability. Many of these officers were performing services the value of which was out of all proportion to the rank they held, and were far junior to the corresponding officers of allied services with whom they necessarily worked.

72. This was not only a grave injustice to these fine men, but the policy deprived me of the great advantage of increasing the morale of my forces by prompt rewards, instead of obliging me to assume the attitude of indifference to their demonstrated merits, thus inevitably decreasing their morale.

73. These officers for the most part did not care for the increase of pay, but it was a serious handicap, as well as an embarrassment, not to have the insignia corresponding to their age, experience, and the services they were actually performing, and corresponding to those of the foreign officers with whom they were officially associated.

74. At no time during the war was I permitted to select my subordinate flag commanders and but very few of my other subordinates.

75. Efficiency in war depends so much upon complete mutual confidence and sympathy between subordinates and their superiors, that it seems hardly necessary to state that I should at least have been consulted as to these important assignments, and of course held responsible for the results attained.

76. In the course of time, in the ninth month after our entry into the war, the lack of support referred to above, particularly in respect of the lack of adequate personnel for necessary staff duties abroad, became known in Washington. This was brought to my attention by the following cable messages.

Digitized by Google

DECEMBER 22, 1917.

From: The Secretary of the Navy.
To: Vice Admiral Sims, London.

1732. At House committee hearing of conduct of Navy, Representative Britten said "I would like to have copy of complaints which have come from Admiral Sims on the other side." If you desire to make statement of action of department in reference to sending and supplying force under your command since war began, please send in code.

DANIELS.

DECEMBER 22, 1917.

From: The Chief of Naval Operations.
To: Vice Admiral Sims, London.

Effort being made to credit impression you have been hampered by failure of Navy Department to meet your request for various things, particularly personnel. I feel that a strong positive statement on this subject from you is highly desirable.

BENSON.

77. I was thus confronted with a situation, not uncommon in warfare, that demanded a decision that no military commander should hesitate to make; that is, such a decision as would be most likely, while avoiding conflict, to advance the common cause through the loyal support of superior authority by making the best of existing conditions, no matter how unsatisfactory. As the subject was one the public discussion of which in Congress would have supplied valuable information to the enemy, not to mention increasing his morale and decreasing that of our own fighting forces, it was manifestly desirable that it should be discouraged, and particularly that no information should be supplied that would render the discussion inevitable. The following cablegram was therefore designed to accomplish this purpose:

DECEMBER 23, 1917.

From: Vice Admiral Sims.
To: The Secretary of the Navy.

2366. Your 1732. I strongly deprecate any effort to create an impression that our naval forces in European waters have been avoidably hampered by failure of the Navy Department to comply with my recommendations for various things. particularly personnel.

It is of course well known that the antisubmarine campaign and the protection of allied shipping have been and still are hampered to a considerable extent by insufficient numbers of certain types of vessels, especially destroyers, and by certain classes of personnel, and I have repeatedly made recommendations in accordance with the requirements on this situation. To these recommendations the department has always responded with the assurance that reinforcements of both vessels and personnel were being sent to the maximum extent consistent with the many other requirements of the department in these respects.

The decision as to the relative importance of the employment of our naval vessels and personnel in the theater of actual war operations in European waters and at home must necessarily rest with the department, and I consider it the first duty of those at the front loyally to accept such decisions and to make the best of conditions which are at present admittedly unsatisfactory and must so remain until the energetic measures now being taken to increase our antisubmarine forces produce the necessary reinforcements.

SIMS.

78. The above brief account of the manner in which our naval operations were conducted clearly shows that the following grave errors were committed in violation of fundamental military principles; and it is manifestly desirable that such violations should be avoided in future:

(1) Although war with Germany had been imminent for many months prior to its declaration there were nevertheless no mature plans developed or naval policy adopted in preparation for war, in so far as its commander in Europe was informed.

(2) The Navy Department did not announce a policy until three months after war was declared—at least, not to its representative and the commander of its forces in Europe.

(3) The Navy Department did not enter whole-heartedly into the campaign for many months after we declared war, thus putting a great strain upon the morale of the fighting forces in the war area by decreasing their confidence in their leaders.

(4) The outbreak of hostilities found many important naval units widely dispersed and in need of repairs before they could be sent to the critical area.

Digitized by Google

Destroyers arriving in the war zone had been cruising extensively off our seaboard and in the Caribbean and when war was declared were rushed through a brief and inadequate preparation for distant service.

(5) During the most critical months of the enemy submarine campaign against the allied lines of communication the department violated the fundamental strategical principle of concentration of maximum force in the critical area of the conflict.

(6) The department's representative with the allied admiralties was not supported during the most critical months of the war, either by the adequate personnel or by the adequate forces that could have been supplied.

(7) The department's commander in the critical area of hostilities was never allowed to select his principle subordinates and was not even consulted as to their assignment. A fundamental principle of the art of command is here involved.

(8) The Navy Department made and acted upon decisions concerning operations that were being conducted 3,000 miles away, when the conditions were such that full information could not have been in its possession, thus violating an essential precept of warfare that sound decisions necessarily depend upon complete information.

(9) Instead of relying upon the judgment of those who had had actual war experience in this peculiar warfare, the Navy Department, though lacking not only this experience but also lacking adequate information concerning it, insisted upon a number of plans that could not be carried out.

(10) Many of the department's actions so strongly implied a conviction that it was the most competent to make decisions concerning operations in the war zone that the result was an impression that it lacked confidence in the judgment of its representative on the council of the Allies and its responsible commander in the "field."

It is a fundamental principle that every action on the part of superior authorities should indicate confidence in subordinates. If such confidence is lacking, it should immediately be restored by ruthlessly changing the subordinate.

(11) "To interfere with the commander in the field or afloat is one of the most common temptations to the Government—and is generally disastrous."—The Influence of Sea Power upon History, Mahan.

The Navy Department did not resist this temptation, and its frequent violation of this principle was the most dangerous error committed during the naval war.

WM. S. SIMS.

The CHAIRMAN. At the conclusion of the reading of the above letter I stated that as there were certain matters contained in this letter which Admiral Sims had read at my request, with the contents of which I was not familiar, I should ask the chairman of the full Naval Affairs Committee, at a meeting to be held, to determine what action this committee should take in regard to this letter.

The Naval Affairs Committee met on the following Monday and the following resolution was passed:

That the subcommittee heretofore appointed to investigate the matter of awards made by the Navy Department for distinguished and heroic services be, and it hereby is, authorized and directed on making its report on the matter referred to, to investigate and report on the matters referred to in the letter of Admiral Sims to the Navy Department, in criticism of its action touching operations during the war, introduced before the Senate committee.

The committee has made its report on the matter of awards and is now ready to go ahead with the letter of Admiral Sims of January 7. As the majority report of the subcommittee on the question of awards stated, the committee is not here to determine personal differences between officers of the Navy or between officers of the Navy and officials of the Navy Department. In this case we are here to act upon the matters contained in Admiral Sims's letter of January 7.

Admiral Sims will now take the stand.

NOTE.—It has been the custom of the subcommittee in the case of each witness heard before the subcommittee to submit the testimony to the witness for correction. This has been done in the case of every witness. Witnesses have made numerous corrections and before allowing these corrections, the subcommittee feels that all such corrections should be agreed to by the full subcommittee. The volume of testimony

Digitized by Google

is very great and owing to the pressure of work in the last days of the session, there has been so little time in which to go over the correction of the testimony that the subcommittee has decided to make up the reports of the hearing in preliminary form without correction, with the understanding that at a later period the proper corrections will be made and the records put in permanent form. These records as they now appear are a verbatim copy of the evidence as published by the stenographer and necessarily are subject to errors both on the part of the stenographer and of the witnesses, errors which will be corrected in the finished report.

STATEMENT OF ADMIRAL W. S. SIMS, UNITED STATES NAVY.

Senator McCORMICK. Mr. Chairman, I wish to remark before we proceed with the hearing that I believe it will occur to those other than the committee, who are present, that approbation and disapprobation directly or indirectly should not be indicated at a hearing of a judicial character, and if there are other manifestations, either of applause or disapproval, I shall ask that the room be cleared.

The CHAIRMAN. I think that the Senator's request is entirely reasonable, and I hope that the audience will not make demonstrations.

Senator PITTMAN. I want to suggest that, at least for to-day, we adjourn when the Senate convenes. The reason for that I believe is quite obvious. There is going to be some very important discussion take place in which each Senator is interested, and I therefore move that we adjourn at noon to-day.

The CHAIRMAN. The Senator from Nevada moves that we adjourn at 12 o'clock to-day until to-morrow morning at 10 o'clock. Without objection that will be done.

Senator PITTMAN. I would like to make this suggestion for the consideration of the committee, that each witness be permitted to finish his direct testimony before any cross-examination takes place, or anything in the nature of cross-examination, and that thereafter any member of the committee be permitted to cross-examine, and that his cross-examination be finished before being interrupted by any other member of the committee, so as to have an orderly process of examination. That is a suggestion.

The CHAIRMAN. I have no objection. Does that appeal to you, Senator McCormick?

Senator McCORMICK. I am satisfied.

Senator TRAMMELL. It is agreeable to me.

The CHAIRMAN. And that the witnesses be allowed to complete their direct testimony before being questioned, if they so desire?

Senator PITTMAN. Yes.

The CHAIRMAN. Admiral Sims, will you hold up your right hand and swear that the testimony you are about to give will be the truth, the whole truth, and nothing but the truth, so help you God?

Admiral SIMS. I do, sir.

The CHAIRMAN. Have you any statement to make in relation to your letter of January 7 to the Secretary of the Navy?

Admiral SIMS. Yes, sir. I am particularly glad that the witness will be allowed to complete his entire testimony before there shall be any cross-examination.

The preliminary statement I have prepared is as follows:

Digitized by Google

I. REASONS FOR THIS PRELIMINARY STATEMENT.

With the permission of the committee, I deem it important to make a brief preliminary statement before proceeding with my testimony in substantiation of my letter of January 7, 1920, which is the subject of the investigation by the committee.

I consider such a statement important and necessary, because of the importance of attempting, in the very beginning, to clearly define, beyond chance of misinterpretation, the real issues which are involved. The entire object of my letter and, in my opinion of this investigation, in its national aspect, will be jeopardized if we are led off into side tracks, if, for example, personalities, having no bearing whatever on the subject in hand, are allowed to confuse the issue.

I take it, gentlemen, that any subject worthy of the attention of a senatorial investigation is a large one, involving solely national interests. Such, and such only, is the subject-matter of my letter. The issues raised therein are far above personalities or local controversies within the naval service. Such questions have not been initiated by me, nor will I initiate them voluntarily. It must be recognized that my letter was not prepared for the consideration of this committee. It was prepared for the sole consideration of naval officers who, owing to their training and their knowledge of the intricate naval activities of the war, their familiarity with the sequence of events, and the great mass of relevant facts upon which the questions raised depend for their true evaluation, are in a better position to understand and determine the merits of the case.

It is manifestly difficult for me to convey the comprehensive picture which is necessary as a background to the points I aimed to bring out in my letter.

These difficulties have been increased by numerous fundamental misapprehensions which have been indicated, either by direct statement or by implication, in testimony presented to this committee in connection with naval awards, and by numerous statements anticipating the present investigation.

In this connection I would invite attention to what appears to be a campaign of deliberate propaganda (at least, so it is believed to be by the naval service), aimed at prejudicing this case by wholly irrelevant subjects prior to its investigation by this committee.

To take but one example. In the testimony before this committee on awards it was seen fit to introduce personal correspondence of mine on a subject quite remote from that issue, and, further, with a full knowledge of the publicity which would attend it. Its introduction was of course camouflaged under the implication that thereby my recommendations on awards were to be in some way invalidated.

My views as to who should have been the commander of the Atlantic Fleet at that time, or, in fact, my differences with Admiral Wilson, regardless of their individual merit, had the most remote, if any, bearing on that case or this.

If the methods of making awards did not affect the morale of the Navy, this instance certainly was calculated to do so. Not content with the publicity which was sure to follow in the press, and to make the case infinitely worse, it was also broadcasted by the Navy Radio Press through high-powered wireless stations to every ship and every naval station in the service.

Digitized by Google

Imagine the effect upon discipline of the fleet when this governmental wireless announcement was posted on every bulletin board for the information of every man, from officers to the last apprentice boy, this information—whether true or not—casting reflections on the ability of their leader, the commander in chief of the fleet, information which through its method of dissemination actually made invidious comparisons between many higher officers of the Navy.

This was a manifest outrage against the efficiency of the fleet, against Admiral Wilson himself, as well as against the proper investigation of the important issues of national safety before this committee.

It is for the above reasons that I find it necessary, solely with a view of facilitating the task of this committee in reaching correct conclusions, to present this statement prior to my testimony.

II. NOT RESPONSIBLE FOR PUBLICITY.

My position has been embarrassed in the first instance by numerous accusations of impropriety and insubordination and by calculated impugning of my motives.

I think it is hardly necessary for me to comment at length upon the impression that has been given that I was responsible for the publicity of the letter here under investigation. It appears from the press that a resolution has actually been introduced into the Senate censuring my action in making this letter public. As I have stated before, no copies of this letter were at any time out of my personal possession until it was called for by this committee. Presumably the letter was called for because the department had published the fact of its existence and general nature.

I understand that it is my duty to reply to queries of this committee and that I am not justified in withholding any knowledge of my own which they request. I do not see how I can in any way be held responsible for any publicity of testimony which this committee calls upon me to offer.

III. PROPRIETY OF SUBMITTING THE LETTER.

I wish also to establish very clearly that there is no question whatever as to the propriety of my submitting this letter to the department and, furthermore, as to my duty to do so.

(1) *In accordance with Naval Regulations and custom.*—Such a letter is not only in accordance with Naval Regulations, article 1534, but is in accordance with a recent general order of the Navy Department accentuating these regulations.

(2) *Duty to submit the letter.*—As to the question of my duty in writing such a letter, the fact will be established, I believe, to the entire satisfaction of this committee that throughout the war I was in every sense of the word an integral part of the departmental organization. My original mission assigned by the department was to act as its representative abroad, and this remained my paramount mission throughout the war.

Throughout the war I was just as much a member of the departmental organization, whose errors I now consider it a duty to establish, as any official with a desk and a chair in the Navy Department Building in Washington. The testimony will leave no doubt in anyone's mind upon that point.

Digitized by Google

(3) *My position and responsibilities in the war explained.*—The impression has been conveyed that my official position abroad was a purely local one, and at least implying that our naval participations in the war was in nowise dependent either upon my recommendations or on my being kept informed of departmental general policies and plans. This is entirely erroneous, as I will make clear to the committee before the conclusion of my testimony.

In justice, however, to myself, as well as to the insurance of proper conclusions by this committee, it seems necessary to make a few preliminary comments on this subject.

It is unnecessary to point out that success on the sea as well as on the land was wholly dependent upon teamwork between the allied navies or, in a phrase, upon unity of command. All allied navy departments, except the United States, were in constant personal touch, both by personal conferences, by telephone, and through a constant exchange of officers who could move back and forth in a matter of hours. Such were the means of obtaining teamwork between the allied navies. Our department, on the contrary, was 3,000 miles away. It was, therefore, my principal mission to represent our department in these allied councils with the sole object in view of teamwork. It was not my mission merely to obtain and transmit statements from allied leaders and from the department. Any well-equipped clerk could have been picked up who could have performed that task as efficiently as I could. On the contrary, it was my mission to speak for the department and to keep in daily touch with allied leaders, and, with the knowledge which I was supposed to have of the state of readiness of our service and our plans and intentions, to give the department the benefit of conclusions thereby formed on the spot.

The difficulty of coordination—of teamwork—between nations is proverbial. Nations, more than individuals, are prone to be selfish and put their own individual national interests ahead of the interests of a common cause.

An allied leader remarked to me during the war that his experiences in the war had greatly diminished his admiration for Napoleon's successes, simply because Napoleon had never had anyone opposing him but allies.

In view of the impoverishment of all of the allied nations from over three years of war, and of our relatively enormous untouched resources and strength, it was natural and to be expected that, when we entered the war, all allied nations should commence to flood us with individual requests for cooperation and assistance. Many of them gave insufficient consideration to the "cause" as a whole, or to the interests of others. It was, therefore, my duty to attempt, by personal conferences and actual presence on the scene, to establish a just balance between the various individual requests, with the object of making our cooperation as effective as possible.

Still another part of my mission was that of attempting on the spot to collect and digest the previous three years' war experience of our Allies. During that period a most effective wall of secrecy had been maintained around the activities of the allied navies. We had a great fleet at home; in fact, our entire service was then at home, and it was therefore of the utmost importance to the efficiency of our participation that we should accumulate and digest in the quickest

Digitized by Google

possible time all of these previous actual war experiences, not only to find out how to do it but, what was equally important to us, to find out how not to do it. This involves a long story, upon which I could spend many days. It started with big questions of strategy and tactics and went clear down into the most minute of technical questions; as to the efficiency of weapons, and even to such details as to methods of clothing and feeding and caring for men, as developed under real war conditions.

Operations in the south Atlantic, Pacific—everywhere—depended, for their effectiveness in insuring victory, upon teamwork, upon the simple requirement that all hands should work for a common end, that there should not be the slightest duplication of effort, and that not a single ship or man should be unnecessarily used, or a single dollar or life needlessly sacrificed. As I repeatedly pointed out to the department, the greatest efficiency would have been attained if we had bodily moved the planning and directing end of our Navy Department over to Paris or London, leaving behind in Washington only the organization for insuring support and coordination of home material effort. All departments of our Government vainly attempted to bridge over this gap by sending commissions abroad at intervals of many months, and only history will tell how much the war was thereby prolonged, and what needless sacrifices of life and of national wealth were thereby involved, through delays in understanding the necessity for various measures, and the resulting inevitable misunderstandings and misdirecting of effort. All of these efforts, regardless of their individual excellence, were delayed, or failed in complete effectiveness, simply because they were either nullified or diminished in efficiency by not being coordinated with the efforts of other members of the team.

Herein, therefore, lay my major and paramount mission, beginning with my original orders and continuing to the end. The task was mine of trying to be the connecting link between our naval directing organization—the Navy Department at home—and that of our fellow team workers; of trying to convey, over a 3,000 mile cable, the experience, efforts, and aims of our Allies from day to day. In other words, trying to keep the department in Washington informed of the situation as fully as if it were on the scene where only "up to date" information was available, and was under constant discussion.

About six weeks after undertaking this task, with the assistance of one aide, I was given the additional task of being responsible for the actual operation of our first real contribution to the allied naval team, namely, six destroyers. This added responsibility gradually (very gradually, as will be shown) grew until, at the end of the armistice, it involved a responsibility for the operations of about 80,000 officers and men, and over 300 ships, whose activities were scattered in 47 different localities, extending from the Arctic Ocean all the way around to the Black Sea. But even apart from this additional responsibility, there were a multitude of others, as members of all governmental war services can attest. The Navy performed many services yet to be disclosed. I would not venture at this time an estimate of how much the Shipping Board, the petroleum, food, grain, and other governmental commissions, and the various relief organizations, all of which contributed their share to victory, are indebted to the Navy for valuable and essential assistance.

Digitized by Google

Another grave and additional responsibility which developed later was that of the safety of our troops on the high seas. The war zone routes followed by every American troop ship, every United States Government ship of any description, naval as well as merchant, the specific plans which permitted the certain joining up of our destroyers in the war zone with all of these ships, all without exception emanated from our naval headquarters abroad. Not one of these routes or plans originated in any other place. Anyone, from doughboy to diplomat, who crossed the ocean during the war, can testify as to his prayers of thanksgiving when these destroyers turned up in the war zone. I am now merely stating facts, in order that there can be no question as to the true conditions of the war, and the fact that I was not only justified, but in duty bound to comment upon the lessons of the war which should govern us in the future.

As to the question of the responsibility for the safety of our ships and troops in the war zone there can be no question whatever as to whose throat would have been justly cut if any of these routes selected and laid down, or plans for destroyer meetings, had resulted in disaster. As I have repeatedly reiterated, this was the work of my assistants. To them belongs the credit. But it was all done in my name, and I necessarily bore the responsibility.

(4) *Relations to Atlantic Fleet at home.*—For some reason not known to me, the statement has been made that, on paper at least, I was a subordinate of the commander in chief of the Atlantic Fleet, and that the forces under my command were at all times a part of that organization. I would not have brought this point up myself, and dislike to even touch upon it now for fear of my remarks being construed in any way as a reflection upon the fleet at home and its great and essential work in the prosecution of the war.

It is quite true that throughout the war the forces in European waters were carried, on paper, as a part of the Atlantic Fleet in home waters.

For reasons which it is unnecessary to discuss at this time, it was deemed by the department a wise course to maintain at all times a broad organization of our entire Navy upon which we could fall back in case of need. Fortunately, such a contingency never arose, but, as far as this inquiry goes, it should be sufficient to set forth the following facts with which I am certain the commander in chief will be in full accord:

First. At no time during the war did I receive any order from the commander in chief of the Atlantic Fleet at home affecting actual operations, disposition of forces, or plans for the forces under my command in European waters.

Second. By specific orders of the Navy Department, all of my communications were made direct to the department, and all orders were given to me direct from the department. It is therefore apparent that I was in actual command of all of the forces abroad, and was solely responsible to the Navy Department for their successful operations.

(5) *My orders.*—It is true that, if anyone be so included, the fact can be brought out that the exact letter of my specific orders did not fully and comprehensively specify the functions which I was called upon to perform abroad. It is for this reason that I saw fit to point out in my letter of January 7, 1920, how vague and unsatisfactory

Digitized by Google

were my original instructions. I am confident, however, that before my testimony is completed, there will be no question whatever left in the minds of the committee as to the spirit of my instructions, or as to what the department expected of me, and, therefore, as to what was my real mission in the war.

I might refer here to one more point in this connection, and that is that from the very moment we declared war there was in being a central allied direction whose function it was to attempt to produce team work between the different navies. During the early months of our participation in the war, this organization was not graced with a definite name, although it existed and functioned constantly. It consisted of the Secretaries of the Navies and Chiefs of Naval Operations of the different allied navies, and formal meeting between them occurred throughout the war practically monthly. Some time in 1917 it was thought wise to give this organization a definite name and draw up something in the nature of a constitution. The name selected was "The Allied Naval Council," and the constitution required that the members should be, as stated above, the Secretaries and Chiefs of Naval Operations of the various Navies. Owing to the distance away of our Navy Department, I received definite and specific orders to serve as a member of this Allied Naval Council, representing our own Secretary of the Navy and Chief of Naval Operations. I had, of course, been so serving from the very moment of arrival in Europe, and I continued so to serve until the signing of the armistice.

I trust that I have made it clear that my position abroad was far from being a local one. I was in every sense of the word a responsible official of the Navy Department organization. My status corresponded closely in nature to that of Gen. Pershing and Gen. Bliss combined, although naturally the aggregate of their duties were of far greater magnitude than mine. It was a mere incident—although a very unfortunate one for the efficiency of our naval part in the war—that my office was located over 3,000 miles away from the Navy Department, instead of a few city blocks or flights of stairs.

(6) *As to accusations of failure to recognize mission of troop protection.*—I can not pass by the implication which has been given out that I failed at the proper time to recognize that the primary mission of the Navy's task was the safe transport of troops abroad. As stated above, the troop movements during the period covered by my letter were very small.

And incidentally let me state right here, with all possible emphasis, that my entire letter of January 7, 1920, refers to this early period of the war. Practically all of it refers to the first six months. Hardly any of it refers to anything out of the first year, 1917. It has practically nothing to do with the efficiency of the Navy and the Navy Department in 1918.

I expect, during the course of my testimony, to make that statement a number of times, because I want it to be definitely understood that my criticism has nothing to do whatever with the very marked efficiency that the Navy Department exhibited and that the Navy exhibited in the latter part of the war, after they really got into it.

I have stated that the troop movements during the period covered by my letter were very small. There can be no argument on this point. The facts speak for themselves. Our troops always received a larger

Digitized by Google

measure of protection than any of the allied troops on the high seas, and from three to ten times as much protection as merchant ships. Our troops were transported to the war area, in so far as our own Navy was concerned, without any loss from enemy action.

I put that statement in this preliminary statement to counteract the statement that was given out semiofficially at least, that my principal anxiety abroad was the protection of merchant ships and not troop ships. That is the way the issue that is now before this committee has been camouflaged.

But let me point out that, although the safety of our troop was our greatest concern, nevertheless there was another concern which, although it took second place, could never be disregarded for a moment. Whether we liked it or not, we were confronted with the dilemma which, briefly stated, was that we ran the danger at all times of being caught with a larger army, either at home or abroad, wholly impotent to have any effect in obtaining victory. It is unnecessary for me to go into a long explanation as to the dependence of our Army abroad on food, ammunition, and a myriad of other supplies. We were at all times confronted with the danger of finding ourselves with an Army abroad which could not be supplied. In the early months of the war those cargo ships, regardless of the flag at their stern, were carrying the stuff necessary to keep the Allies going until our Army could be gotten across. Throughout the entire time that our Army was moving, as the Army authorities will attest, we were confronted with the gravest anxiety as to whether we could save enough ships to supply the Army after it got over there. In the vernacular of the street, we had to beware of having an Army all dressed up, but no place to go.

It was not United States shipping upon which the outcome of the war was dependent during that first critical year, but allied shipping.

The Allies' fate was our fate. As I will show you in the testimony, there was grave danger of enemy success before American military effort could be brought to bear at all; and, as I will further show you, particularly in those early days, the American cargo carriers were an infinitesimal part of the available shipping, allied and neutral, that was necessary to prevent the enemy from winning.

IV. LOYALTY TO AMERICAN INTERESTS AND TO THE NAVY DEPARTMENT.

(1) *Accusations of being pro-British and sacrificing identity of our own Navy.*—I can not avoid reference to repeated assertions to the effect that I am not a natural-born American, or that my allegiance was ever in the slightest degree divided. My father was an American citizen whose family has been continuously resident in the United States since before the Revolution. I chanced to have been born in Canada because my mother was, at the time of my birth, on a visit to her father, who was a Canadian. I notice, of course, also that I have been called pro-British. I would not stoop to answer any of these charges were it not that they bring up a very important point in connection with this investigation. In reply to a letter from a friend during the war who wrote to warn me of accusations of being pro-British, I suggested that he ask his informants what sort of a man they did want as a representative in the council of the Allies,

Digitized by Google

and I said that if pro-British and pro-French proclivities were undesirable, why not send over a pro-German with a trunk full of bombs. Strangely, I have apparently never been accused of being pro-French, although, as a matter of fact, I speak the French language perhaps better than I have ever been able to master the British, and if anything, I believe that my relations on the whole were even more cordial and harmonious with the French than they were with the British. Perhaps this was due to the greater similarity of our methods to those of the British. Possibly we knew each other too well. Once the war was on, it was the duty of every public servant, and particularly those of the military services, to do his level best to subordinate all local and selfish interests to the one great task before them—that of defeating a common enemy. We were confronted with an enemy acting under the most perfect unity of command. The requirements to obtain victory on our part can be summed up in the one word "teamwork." It was absolutely essential to naval efficiency and victory that all naval services on the side of the Allies be merged into one team, with one mission—that of defeating the common enemy.

There was no danger whatever of our losing our identity. Anyone who took part in the war, which involved joining with foreign navies, can testify to the fact that our identity was accentuated day by day, and never diminished. If there was no other reason for making us out, I would say that the principal one was our unreserved determination to promote team work. It was the talk of all other services in Europe. It attracted more attention perhaps than any other part we played in the war.

In a great and complicated game, such as that of the joint operation of four navies, it was to be expected that all sorts of sources of friction would arise. Each service was proud of its own individual methods, which it had developed at the cost of long and serious labor in time of peace. If everybody had refused to play unless their methods were adopted, or had pursued their methods in the face of the different methods of the forces with which they were operating, there would have been nothing but confusion, and that would have been a direct contribution to the enemy campaign. It was no simple or easy task to attempt to reconcile these conditions. As far as my own forces were concerned, I preached, from the very beginning, the doctrine that the one test to be applied, whenever any difference arose, was how we could best "get on with the war;" what course would eliminate friction and speed up the day of victory. I laid down the doctrine that, as a general rule, the minority should give way to the majority, and that if we believed our methods to be better, as they were in many cases, the best course was not to be stubborn and insist upon their immediate adoption by men who had been using different methods for three years, but to prove their efficiency to the other fellows in such a way as not to interfere with the operations in hand. This in itself is a long story, but I am safe in asserting that, whether the score as to who gave way the most is on our side or not, all allied services will admit that we led in setting an example of subordinating everything to "getting on with the war." And furthermore, that all allied services to-day will agree that they learned just as much from us as we did from them.

(2) *Loyalty to the department, and lack of departmental confidence in me.*—As to the imputation that I was not duly obedient to the department's orders and intentions, which are accusations that have been given out from time to time, during the progress of the war, I will leave this entirely to the committee's own judgment, after they have considered the facts which I will proceed to submit. After the wholehearted support of the Navy for allied team work had been obtained, the Secretary of the Navy said, in his annual report, dated December 1, 1918, as follows:

> Abroad the American Navy has given a demonstration which can be characterized only as wonderful, of its readiness to join with our associates in teamwork for the common end and the common good.

Let me state here the fundamental military principle that loyalty is as necessary down as up. Confidence can not be onesided. It must be mutual. There is no question of justice to me. The fact is indisputable that as long as I was left in the position assigned me, the efficiency of every phase of our naval activities with which I was connected, was diminished and endangered by any lack of confidence in me. Personalities should be ruthlessly eliminated from war problems. If the department lacked the slightest confidence in me, it was reprehensible not to have summarily replaced me with someone in whom they did have confidence.

During the trying period—as will be covered in the testimony—when I was so sorely embarrassed by lack of departmental confidence and backing up, I repeatedly pointed out in personal correspondence with officials of the department that if I had lost the confidence of the department in any way I hoped no hesitancy would be felt in replacing me.

It is instructive to contrast the practice of the Navy Department in this respect, and its general relations with its commander in the "field," with the practice of our War Department. The following is quoted from page 8 of the last report of the Secretary of War, addressed by the Secretary of War to the President of the United States:

> The communication between Gen. Pershing and the War Department was of course constant and voluminous. It dealt, however, with details of men and supplies. The authority conferred upon him by his original orders (which clearly outlined general policies) was never in any particular modified or diminished, and the fundamental view expressed in his orders as to the character of American participation was steadily adhered to under your direction to the end. Gen. Pershing left America with your full confidence and that of the War Department. Throughout the strenuous and sometimes terrible months of our participation, this confidence supported and sustained him, and when he returned to America it was to close a great military undertaking, during which no shadow of misunderstanding had arisen between him and his Commander in Chief. The theory of these orders of course was that our field of operations was necessarily removed a great distance from Washington, that it was quite impossible for us to form accurate judgments of the varying incidents in the field of operations, and that imposing the tremendous responsibility for the success of the expedition upon its commander we could not do less than give him full authority and leave him untrammeled by attempts to formulate plans of action which, made at a great distance, could not be informed with knowledge of the situation which the commander at the front had when the plans reached him.

Had such methods been practiced by the Navy Department, the naval part of the war would have been greatly furthered.

(3) *Relations with the British.*—Let me clear up another point in this connection, which has been subject to considerable comment and misunderstanding. Pronounced criticism has appeared recently

Digitized by Google

because of the fact that an admiral of the British Navy controlled the operations of American destroyers at Queenstown. I will attempt to state very briefly what this particular situation was. The admiral at Queenstown not only commanded the local forces based on that port, but also the British naval station located there, and the entire British and, in fact, allied naval command of the seas approaching Great Britain, both to the southward and the northward of Ireland. Other forces stationed in the north of Ireland were also under his general direction. His control of our forces was limited solely to their actual operations at sea, in which they were employed in conjunction with British forces. The administration of this American force, its wants and needs, its discipline, was exercised by me through my local representative, Capt. Pringle. The same principle was adopted by our Army in France, where American brigades, divisions, or other units served under the operational control of British or French general officers. Furthermore, this principle was applied generally and properly throughout the allied navies irrespective of nationality. Frequently in Irish waters alone, British and American vessels acted under American command. In the mine-laying operations in the North Sea, British destroyers furnished the escort. On the French coast, French vessels frequently served under the immediate command of our own officers. In the Mediterranean, the French admiral exercised control over all allied forces, British and otherwise. Again, in the North Sea our division of dreadnoughts, under Admiral Rodman, frequently engaged in detached operations with British forces of light cruisers and destroyers under his command. Moreover, in this case, as Admiral Rodman was not given a rank commensurate with his duty, it was necessary in many cases for military precedent to be disregarded, and by merely a gentleman's agreement upon the part of the British, British admirals in command of these forces assigned for operations under Admiral Rodman actually accepted his command, although they were senior to him.

I will not take the time to explain the system by which orders were originated and transmitted to our forces whether under allied operational command or our own. Suffice it to say that such orders as did not issue directly from our own naval headquarters, were either prepared in conference with representatives of those headquarters, or else were based upon definite plans which those representatives had taken part in preparing.

Copies of every order issued to our forces, no matter how trivial or detailed, were immediately and automatically forwarded to our own headquarters for information, and complete and detailed summaries of them were furnished weekly to the Navy Department. No detail was too small to be followed up by our own organizations of command.

(4) *Undue British dominance in naval war.*—It has frequently been asserted that the British exercised an undue control and influence upon the naval operations of the war. Even granting that they did, or whether they did or not, such a course should be expected when we consider that they outnumbered any other naval forces in Europe about 10 to 1, in anything you wish to consider—guns, men, ships, shore stations, etc. The French, Italian, Japanese, and our naval forces abroad were small in comparison. The department in its announced official policy of July 10, 1917, acknowledged this fact.

Digitized by Google

The following is a quotation from the Navy Department's instructions:

As the primary rôle in all offensive preparations must perforce belongs to the allied powers, the department announces as its policy that in general it is willing to accept any joint plan of action of the Allies deemed necessary to meet immediate needs.

Furthermore, owing to the strategic situation of England, and her extensive maritime interests prior to the war, she was, in fact, the maritime center of information of the world. All the war lines of communications led there, and it was only there that the most complete information concerning operations of the war and merchant shipping of the world was available. It was therefore, as I have stated, to be expected that the British voice in naval affairs should be heard above the other voices of the team, just as the French command influenced greatly the operations of all land forces. However, there were ample safeguards against undue British domination. These were furnished by the principles of command previously explained, and further by the fact that all big questions of naval policy were supervised by the Allied Naval Council, in which each nation had an equal vote, and in which unanimity was required for any decision.

(5) *The Navy not attacked.*—I find that I am being represented in many quarters as initiating an attack upon the part that the Navy played in the war, or, stated more briefly, that my object is to belittle the efforts of the Navy in the war. Therefore, let me most clearly state a few salient facts:

First. I have raised no question whatever as to the efficiency of our naval operations in the war, when viewed in their entirety and without regard to the time element.

Second. Speaking of the Navy itself—that is, its personnel and ships apart from the organization which directed it—I am in the fullest accord with the country in being unable adequately to express my admiration for its work. That work will grow larger and larger in public estimation as the facts slowly come out. I am proud to say, without fear of contradiction, that in so far as the Navy was permitted by the machinery which controlled and directed it, it not only lived up to all traditions of the past, but as a matter of fact it excelled its former traditions. Without any disparagement of actual results accomplished, I believe that its greatest accomplishment was the example set and the spirit which it infused into the naval war through its exhibitions of Americanism; for example, in its irrepressible enthusiasm, its indomitable initiative and versatility, its absolute refusal to be balked by obstacles, real or imaginary, its ruthless disregard of precedents, and, above all, in its absolute confidence in victory.

V. PERIOD OF THE WAR COVERED BY THIS LETTER.

I now come to a very essential feature of my letter which seems to have failed in being clearly recognized and understood.

It is very important. An examination of the letter will show that the period which it covers is almost wholly concerned with those critical months immediately preceding our entry into the war and for about the first year or less of our participation. In considering the letter, therefore, the case must not be confused with the conduct of the war as a whole.

Digitized by Google

That is what I tried to accentuate a little while ago. In all of the criticisms that have appeared in the press since this controversy started that is the most insistent one, that Admiral Sims is throwing mud at the Navy. And then they expose the fact that we did the greatest stunt in all naval history, that we transported 2,000,000 troops across to Europe without any loss; that we put the barrage across the North Sea, etc., all of which we did; all of which has no concern at all with this investigation of my allegations as to the conduct of the Navy Department in this war during the first six months, or, at most, during the first year.

The period in question is those critical days when our control of the sea was threatened and when the enemy was rapidly winning the war by cutting our essential lines of communication on the high seas. It was then that prompt and whole-hearted naval assistance from America would have been of the greatest value to the common cause. This point is of such importance that I beg to illustrate it by a comparison with the conditions in France in 1914.

We are all familiar with the situation confronting the French during the first month or two of the invasion of Belgium and northern France. Whether or not the German tide could be stemmed was impossible to predict and depended greatly upon what reinforcements the British could send and how soon they could arrive. A relatively small force and a difference of a few days or weeks in its arrival might easily have changed the balance between victory and defeat. Furthermore, advance knowledge of the strength of the reinforcements to be sent and of the time of their arrival was of great moment to the French, as it would affect intimately their plans for the distribution and operation of their own forces. Nothing could be more apparent than these elementary facts.

The naval situation when we entered the war was almost precisely analogous in its general features to the situation on land during the first weeks of 1914. The enemy's "unrestricted submarine campaign" was at the apex of success. Shipping was being sunk at the rate of over 10,000,000 gross tons annually. Had this rate of sinking been continued but a few months the available tonnage would have been reduced much below the minimum requirements. The military effort of the Allies would then have shriveled to ineffective limits for lack of military supplies, and the civil populations of our allies would have been reduced to desperation. Had the available tonnage then been so reduced, as was so nearly the case, it would have been impossible to send an American Army of respectable size to France or to support it afterwards until a lapse of many months had permitted the Allies to regain control of the sea and replace lost merchant tonnage; if, indeed, it could ever become possible to do this before defeat on land.

In view of this situation the highest allied officials were exceedingly apprehensive as to their ability to weather the crisis. Their available antisubmarine forces were exceedingly small compared to the size of the vital areas to be protected, and most of the antisubmarine vessels and their personnel were badly war worn. The urgency of the need for reinforcements could not be exaggerated. To safeguard the allied cause it was imperative that every possible vessel suitable for antisubmarine or salvage work be dispatched from America with the utmost haste to the area of submarine operations. What

Digitized by Google

I believe to be our failure to meet this emergency, with the means then available to us, is the principle, which I once more accentuate; the failure of our Navy Department to act promptly in this part of the war.

Repeatedly, in fact, almost daily, during April and May, 1917, I represented these essential facts to the department in lengthy cablegrams, couched in the most emphatic language of which I was capable. Apparently the department then believed that the allied officials and I were overestimating the gravity of the situation. Not until the first visit of the Chief of Naval Operations, about six months after we entered the war, did the department seem to be convinced of the salient facts and adopt policies and plans previously recommended by me and begin to engage in the war wholeheartedly

I am convinced that our failure to give adequate support with the means at our disposal during these first six months seriously and unnecessarily jeopardized the outcome of the whole war. In my opinion, it undoubtedly resulted in lengthening the war by several months, through the increased losses in merchant shipping that resulted therefrom. I believe that this failure, combined with the equally grave one of neglecting to prepare adequately during the first months previous and the first few months subsequent to our declaration of war, probably postponed victory four months. Since the average loss of life per day was about 3,000 and the total daily cost of the war was $100,000,000, it can be appreciated what this delay meant to humanity and how serious was any fault that resulted in materially prolonging hostilities.

I wish particularly to emphasize that it is this early period to which my letter principally refers.

MOTIVE FOR LETTER.

Let me point out, in the simplest and clearest possible manner, the paramount motive upon which my letter was based. It is this: We entered a great war. The war was won, thanks to a combination of circumstances which it would be entirely unsafe and unwise to depend upon in the future. From the United States naval standpoint, the prosecution of the war involved numerous violations of well-recognized and fundamental military principles with which every student of naval warfare is familiar.

Briefly stated, they were:

First. Unpreparedness, in spite of the fact that war had been a probability for at least two years and was, in fact, imminent for many months before its declaration.

Second. That we entered it with no well-considered policy or plans and with our forces on the sea not in the highest state of readiness.

Third. That, owing to the above conditions and to the lack of proper organization of our Navy Department, and perhaps to other causes with which I am not familiar, we failed, for at least six months, to throw our full weight against the enemy; that during this period we pursued a policy of vacillation, or, in simpler words, a hand-to-mouth policy, attempting to formulate our plans from day to day, based upon an incorrect appreciation of the situation.

The Great War lasted 1,500 days. Five million lives were lost, or about 3,000 daily. This, to say nothing of wealth and resources.

Digitized by Google

If my assertions of vacillating policy and unnecessary delays are true, I indeed had a compelling motive in taking steps to preclude their recurrence in the future.

I believed, therefore, in view of the unusual position which I held during the war, as an integral part of our departmental organization, that it was my duty to point out at least some of the reasons for the fundamental errors which were committed.

My sole object in submitting my letter to the department was not to demonstrate who was right and who was wrong, but rather to insure so thorough an appreciation of our errors, before time had obscured them, that the chances of repeating them would be minimized, if not eliminated, in the future.

In other words, gentlemen, let me state, as forcibly as I can, that in this entire question I have no object other than that of the future efficiency of the naval services and the safety of the country. I am at the end of my career. I have everything to lose and nothing to gain. There is no possible question of my having a grievance. There is absolutely no question of personalities. I have no further ambitions whatever. When this inquiry is over I return to the simple duties of my profession, to finish out the very short remaining time before my retirement.

Reference to my letter of January 7, 1920, will indicate clearly that its object is, first and last, constructive. This object is impossible of accomplishment without a consideration of such mistakes as may have been committed.

The subject is one which vitally affects the future efficiency of what must always be our first line of national defense, the Navy; and the great danger is that because of our ultimate success in this war, we may fail to realize that we very narrowly escaped defeat on the sea, that our state of preparedness when we entered the war was dangerously inadequate, and that our administrative methods, especially during the early stages of our participation, were seriously at fault. Such defects, in a war in which the enemy is not already so seriously occupied at sea as he was in this war, must inevitably jeopardize gravely our national security.

Under these circumstances, expressions of opinion concerning such matters were in no sense an attack, and it is most deplorable that they should have been made so to appear. They were, on the contrary, impersonal, official representations submitted for the consideration of the Navy Department in preparation for future campaigns. They were actuated by motives of duty; they were constructive, and I believe them to be entirely in accord with the teachings of accepted authorities on the art of war. Should this discussion unfortunately assume the character of personal recrimination or political controversy, the effect may well be so to obscure the issue that no lasting good will result. On the other hand, if these opinions are given careful consideration in connection with the preparation of plans for future wars, by the officers detailed to these duties, as was intended and as would ordinarily have been done, very great benefit would accrue to the Navy.

It is nothing but self-evident camouflage to convey the impression in these modern days that such an issue as this one raised by me is an attack on civilian control of our naval service. A civilian head of the military branch of a democratic government is essential. There

Digitized by Google

is not the slightest danger of militarism in this country. The public rules. We in the Navy are servants of the public and aspire to nothing else. The Navy claims to be as representative a national organization as the Congress itself. It is for this very reason that I have had the temerity to risk my personal fortunes at the very end of my career, and lay before the responsible heads of the Navy such radical criticisms of their own conduct of the public's interests.

In view of the public presentation of this case, which has resulted from no intent on my part, I am perhaps handicapped by lack of any connection with the press or experience in manipulating that important instrument of public opinion.

I can only present my case in the vocabulary of my profession, and trust to the sagacity of this committee to perceive the only essential issues at stake, namely, a just appraisal of those questions which in any way endanger the public interest.

VII. SUMMARY.

To sum up in the briefest possible manner, I hope that this statement, and the testimony which will be introduced, will establish conclusively the following salient points which were raised in the letter which I addressed to the Navy Department on January 7;

First. That there was no impropriety whatever in submitting this letter; that its preparation and submission was in accordance with naval customs and regulations; and that I am in no wise responsible for the publicity which it has received.

Second. That the submission of the letter was a duty which devolved upon me, because of the unusual and very responsible position I held during the war, and because our victory seemed liable to blind us to the mistakes we committed and the lessons we should have learned therefrom.

Third. That my position was in no sense a local one; that it was not comparable to that of any other naval official outside of the Navy Department; and that it was twofold in nature. My first and paramount duty was that of acting as the department's accredited representative in the naval council of the Allies. In other words, in this capacity I was in every sense of the word an integral part of the departmental organization. Secondly, my duties included the active and independent command of all of our naval forces in European waters, and the additional responsibility of insuring the safety of our troops in passing through the war zone.

Fourth. That the period of the war covered by my letter, which I propose to substantiate by my present testimony, is encompassed almost wholly in the first six or eight months thereof, during which period the Allies barely escaped defeat.

Fifth. That during this early period the department violated numerous well-recognized and fundamental principles of warfare, and that, as a result, the full effect of our naval participation was seriously delayed, and that this delay is susceptible of conversion into very serious and unnecessary losses of national wealth and lives.

Sixth. That, to state the case in its briefest form, the only purpose which I have in mind is that, in the interests of national defense, we may make clear those lessons of the war which we dare not lose sight of, and which must govern our future naval policy if the fullest measure of insurance against future disaster is to be provided.

Digitized by Google

Seventh. That the policies and plans adopted by the department and their activity, in the last half of our participation in the war, were identical in substance, and generally in letter, to recommendations which they had disregarded or failed to act upon in the early months.

Eighth. That the main issue is not the determination of personal responsibilities, but the recognition of the delays and unsound methods incidental to the adoption and execution of our war policies and plans, in order that the fundamental causes thereof may be removed.

Ninth. That if I am wrong, and we were prepared, and if we had plans before and at the beginning of the war similar to those announced on paper some time after we declared war, and if such plans were in accordance with the policy which was actively and actually pursued at the end of the first six or eight months of the war, then is it not a grave error that all the forces of men and ships which were actively engaged in the war zone at the end of this six months' delay, were not there at the end of the first month?

Tenth. Granting that the work of our Navy was necessary, and was based on sound policy and military principles, it is indisputable that if any delay occurred in putting that policy into effect, the war was thereby prolonged, and as a consequence lives and resources needlessly sacrificed.

If such is not the case, that is, if the work of our Navy was not necessary, then our naval contribution did not amount to much.

It did amount to a great deal, as everyone agrees, and hence it is the motive of my letter to show that unsound methods caused such delays, and that they should be recognized to such an extent as to make them impossible of recurrence in the future.

The issue is that of national safety.

Eleventh. And, finally, may I be permitted to add the following: It is not an easy or an enviable task for an officer to expose the fundamental errors of his own service, particularly after a war that has been won.

It was of course to be expected that, if such exposures were given publicity, a storm of criticism would descend upon me, including accusations of belittling the services of our gallant naval men who have made so many sacrifices.

It is submitted, however, to the judgment of this committee that if any one of my assertions are true, I would have betrayed the trust imposed upon me if I had allowed any considerations, personal or otherwise, to have deterred me from submitting my criticism officially to the Navy Department.

Mr. Chairman, I am ready at any time to go ahead with my attempt to substantiate the allegations made in my letter of January 7, 1920.

The CHAIRMAN. In view of the fact that it is nearly 1 o'clock, and you have finished your preliminary statement, the committee will now stand adjourned until 10 o'clock to-morrow morning.

(Thereupon the subcommittee adjourned until to-morrow, Wednesday, March 10, 1920, at 10 o'clock a. m.)

Digitized by Google

NAVAL INVESTIGATION.

WEDNESDAY, MARCH 10, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale, presiding.

Present, Senators Hale (chairman), McCormick, and Trammell.

The CHAIRMAN. Senator Poindexter, having resigned as a member of this subcommittee, Senator Page has appointed in his stead Senator Ball of Delaware. I offer for the record Senator Poindexter's letter of resignation and the letter of Senator Page to me notifying me of the appointment of Senator Ball.

(The letters referred to are as follows:)

MARCH 9, 1920.

Hon. CARROLL S. PAGE,
Chairman Committee on Naval Affairs,
United States Senate.

MY DEAR SENATOR: I have found it necessary to be absent from the city for a few days and shall therefore be unable to give consideration to the investigation of matters referred to in the letter of Rear Admiral William S. Sims, United States Navy, to the Navy Department, in criticism of its operations during the war.

In view of the importance of the work assigned to the subcommittee, I believe it essential that another Senator be appointed in my place, as a member of that subcommittee, and I therefore tender my resignation to take effect to-day.

Cordially, yours,

MILES POINDEXTER.

MARCH 9, 1920.

Hon. L. HEISLER BALL,
United States Senate.

MY DEAR SENATOR: Senator Poindexter, of the subcommittee of the Committee on Naval Affairs of the Senate, having to do with the "investigation of matters referred to in letter of Rear Admiral William S. Sims, United States Navy, to the Navy Department in criticism of its actions touching operation during the war," has found it necessary to retire from that committee and therefore tenders his resignation, which has been accepted, and I have appointed you to fill the vacancy in the subcommittee caused by Senator Poindexter's resignation.

I hope you will find it convenient to serve as a member of the subcommittee.

I have notified the chairman of the subcommittee, Senator Hale, of your appointment.

Very cordially, yours,

CARROLL S. PAGE.

The CHAIRMAN. Admiral Sims, will you proceed?

STATEMENT OF ADMIRAL W. S. SIMS, UNITED STATES NAVY—Resumed.

Admiral SIMS. In presenting the following testimony it will be necessary, in order to make a clear and understandable presentation, to depart from the sequence of my letter of January 7.

I have no intention whatever in going outside in any way of the text of that letter. The letter was not prepared with a view of

Digitized by Google

discussing it with such a body as this committee. It was addressed officially to the Navy Department, which has all the facts and their relative sequence and importance in mind.

It follows that, in order to make these matters clear to this committee, it will be necessary to make certain explanations and give certain details that would not be necessary in considering such questions before a body of naval officers.

The first part of the testimony is intended to explain the seriousness of the military situation at the time that this country declared war; to clearly show that the situation was not only critical, but that the Allies were at that time in fact losing the war; that the Navy Department was furnished with complete information concerning this critical situation; and that I put forth every possible effort to acquaint them with all the facts concerning the situation; that, in accordance with the mission assigned to me, and based upon constant conference with the heads of the allied naval services, I set forth the specific nature of the part which we should have taken; that I was wholly unable to get satisfactory replies from the department and, further, that if the department appreciated and understood the situation, they failed to take action commensurate therewith.

I wish here to state that there is no issue whatever as to whether the information I sent and the recommendations I made were accurate or exaggerated, no issue as to whether I was right and everybody else in the Navy at home wrong, as will be shown later in the testimony. It will be clearly established that by the end, say, of six months, the department accepted and adopted the policies and recommendations that I had made from the very beginning, and hence that there is no disagreement whatever between me and other naval officials as to the United States naval policy in the war, provided the time element is not considered; that is, provided we disregard the first four to six critical months of war, the occurrences during which are, almost exclusively, the issues I have seen fit to raise.

I will adhere in my testimony to the different subjects as they are raised in my letter of January 7, 1920. This will result in not following the chronological order, because as each new subject is taken up I will have to step back to the beginning and sketch what occurred in connection therewith.

In beginning, I wish to read in full my first two reports submitted to the department—one a cable sent four days after my arrival abroad and the other a letter submitted five days later.

Although these two documents will touch on various subjects, it is necessary to read them in full, simply to establish the fact that all of the communications which followed during the next six or eight months were mere elaborations and reiterations thereof, that these two reports were very comprehensive, and that, as a matter of fact, there was no time up to the signing of the armistice when any cause arose for changing any of these original recommendations as made therein.

Digitized by Google

To Secretary of the Navy, through State Department.
Sent April 14, 1917.

I want to emphasize that fact particularly. This reply and this letter contained the policy suggested and the plan for the suppression of the submarine campaign, which was the whole issue of the war so far as our Navy was concerned. This was the first cable, sent April 14, 1917:

The situation is as follows:

The submarine issue is very much more serious than people realize in America. The recent success of submarine operations and the rapidity of construction constitute the real crisis of the war.

The morale of the enemy submarine is not broken, only about 54 are known to have been captured or sunk and no voluntary surrenders have been recorded. The reports of our press are greatly in error. Reports recently circulated concerning surrenders are simply to depreciate enemy morale and results are very satisfactory.

The word "satisfactory" appears in the cable, but it was a mistranslation. The word used was "unsatisfactory." That should read:

The word "satisfactory" appears in the cable, but it was a mistranslation. The word used was "unsatisfactory." That should read:

Reports recently circulated concerning surrenders are simply to depreciate enemy morale and results are very unsatisfactory.

Supplies and communications of forces on all fronts, including the Russians, are threatened, and control of the sea actually imperiled.

German submarines are constantly extending their operations further into the Atlantic, increasing areas and the difficulty of patrolling. Russian situation critical. Baltic fleet mutiny; 85 admirals, captains, and commanders murdered, and in some armies there is insubordination.

The amount of British neutral and allied shipping list in February was 536,000 tons; in March, 571,000 tons; and in the first 10 days of April, 205,000 tons. With short nights and better weather losses are increasing.

I invite attention to the fact there that in April the loss was over 800,000 tons.

The British forces could not effectively prevent the escape of some raiders during the long nights, but the chances are better now.

The Allies were notified that the chances are that hospital ships will continue to be sunk, this in order to draw destroyers away from operations against submarines to convoy hospital ships in this way causing a demand for large convoy forces in all areas not before necessary and also partially immobilizing the main fleet.

On account of the immense theaters and length and number of kinds of communication and the material deterioration resulting from three years' continuous operation in distant fields with inadequate base facilities the strength of the naval forces is dangerously strained. This applies to all of the sea forces outside the Grand Fleet. The enemy has 6 large and 64 small submarine mine layers; the latter carry 18 mines; the former 34, also torpedoes and guns. All classes submarines for actual commission completed at a rate approaching three per week. To accelerate and insure defeat of submarine campaign immediate active cooperation absolutely necessary.

The issue is and must inevitably be decided at the focus of all lines of communication in the eastern Atlantic; therefore I very urgently recommend the following immediate naval cooperation:

Maximum number of destroyers to be sent accompanied by small antisubmarine craft, former to patrol designated high sea area westward of Ireland based on Queenstown with an advance base at Bantry Bay, latter to be an inshore patrol force. Destroyers, small craft, should be of light draft with as high speed as possible, but low speed also useful. Also repair ships and staff for base. Oil and docks available, but advise sending continuous supply of fuel. German main fleet must be contained demanding maximum conservation of the British main fleet. South of Scotland no base is so far available for this force.

At present our battleships can serve no useful purpose in this area except that two divisions of dreadnoughts might be based on Brest for moral effect against anticipated raids by heavy enemy ships in the channel out of reach of British main fleet.

The chief other and urgent practical cooperation is merchant tonnage and a continuous augmentation of antisubmarine craft to reinforce our advanced forces. There is a serious shortage of the latter craft. For towing the present large amount of sailing tonnage dangerous areas sea-going tugs would be of great use.

Digitized by Google

The cooperation outlined above should be expedited with the utmost dispatch in order to break enemy submarine morale and accelerate the accomplishment of the chief American objective.

It is very likely the enemy will make submarine mine laying raids on our coast or in the Caribbean to divert attention and keep our forces from the critiaal area in the eastern Atlantic through effect upon public opinion. The difficulty of maintaining submarine bases and the focusing of shipping on this side will restrict such operations to minor importance, although they should be effectively opposed principally by keeping the Channel swept on soundings. Enemy submarine mines have been anchored as deep as 90 fathoms but majority at not over 15 fathoms. Mines do not rise from the bottom to set depth until from 24 to 48 hours after they have been laid.

So far all experience shows that submarines never lay mines out of sight of landmarks or lights on account of the danger to themselves if location is not known. Maximum augmentation merchant tonnage and antisubmarine work where most effective constitute the paramount immediate necessity.

Mr. Hoover informs me that there is only sufficient grain supply in this country for three weeks. This does not include the supply in retail stores. In a few days Hoover will sail for the United States.

That is the end of that telegram. That was a plan proposed or policy proposed, and it was adhered to throughout the war, that is, to send all possible antisubmarine craft immediately to the place where the fighting was going on. Five days later I amplified this with the following letter:

LONDON, ENGLAND, *April 19, 1917.*

From: Rear Admiral William S. Sims, United States Navy.
To: The Secretary of the Navy.
Subject: Confirmation and elaboration of recent cablegrams concerning war situation and recommendations for United States naval cooperation.

1. *Reception.*—My reception in this country has been exceptionally cordial and significant of the seriousness of present situation and importance to be attached to the United States entry into the war.

I was met at Liverpool by Rear Admiral Hope, R. N., a member of Admiral Jellicoe's staff, and the admiral of the port, the former having been sent by the Admiralty to escort me to London. A special train was provided which made a record run, and within a few hours after arrival in London I was received by the first sea lord (Admiral Jellicoe) and his principal assistants in a special conference.

2. *Conferences.*—More or less hesitancy was noted at first in presenting a full statement of the true situation, particularly (as it developed later) on account of its seriousness, combined with a natural reluctancy against appearing to seek assistance and a hesitancy in taking chances of allowing information indirectly to reach the enemy, and thereby improve enemy morale.

I therefore positively took the position that I must be considered a part of the Admiralty organization and that it was essential to safe and efficient cooperation that I be trusted with a full knowledge of the exact situation.

They finally consented, only after reference to the Imperial War Council, to my exposing the true state of affairs both as regards the military situation and rate of destruction of merchant shipping.

I have had daily conferences with the first sea lord (Admiral Jellicoe) both at his office and residence, and also have been given entire freedom of the Admiralty and access to all Government officials. I have freely consulted with such officials as the following: Prime minister; first lord of Admiralty (Sir Edward Carson); ministers of munitions, shipping, trade, and other cabinet officials; first sea lord and his assistants; chief of naval staff; directors (corresponding to our chiefs of bureaus) of intelligence, antisubmarine operations, torpedoes, mines, mining, etc.

3. *General statement of the situation.*—Since the last declaration of the enemy government, which from intelligence information was anticipated, the submarine campaign against merchant shipping of all nations has resolved itself into the real issue of the war, and, stated briefly, the allied Governments have not been able to and are not now effectively meeting the situation presented.

4. As stated in my first dispatch the communications and supplies to all forces on all fronts, including Russian, are threatened, and the "command of the sea" is actually at stake.

5. My own views of the seriousness of the situation and the submarine menace have been greatly altered. My convictions and opinions, as probably those of the department also, had been largely based upon press reports and reports of our attachés

Digitized by Google

and other professional Americans who have been abroad during the war. All of this information has been either rigidly censored or else has been given out in such form that it would be of minimum assistance to enemy morale.

6. The necessity for secrecy which the British Government has experienced, and which I repeatedly encounter in London, and even in the Admiralty itself, is impressive. There have been remarkable and unexpected leakages of information throughout the war. Certain neutral legations of smaller countries are now under strong suspicion.

The extent to which the submarine campaign is being waged is in itself excellent evidence of the importance attached to it by the enemy, and of the degree to which they counted, and still are counting, upon it.

The intelligence department has reliable information (as reliable as can be) that the enemy really reckoned that the Allies would be defeated in two months through shortage of supplies.

8. With improved weather and the shorter nights now coming on, we may expect even more enemy submarine success.

9. The commander in chief of the Grand Fleet was yesterday in conference in the Admiralty as to what greater extent destroyers and auxiliaries of the fleet may be utilized without endangering its power in the remote possibility of another fleet engagement.

The consensus of opinion seems to be that the latter will not occur, but there is not complete unanimity in this belief, and of course, in any case, the possibility must be adequately and continuously guarded against.

GENERAL DISCUSSION OF SITUATION.

10. I delayed forwarding my first report of the situation with a view of obtaining the maximum information consistent with the importance of the time element. I was also somewhat deterred by a natural reluctance to alter so radically my preconceived views and opinions as to the situation.

11. The evidence is conclusive that, regardless of any enemy diversions such as raids on our coasts or elsewhere, the critical area in which the war's decision will be made is in the eastern Atlantic at the focus of all lines of communications.

The known number of enemy submarines and their rate of construction, allowing liberal factors for errors of information, renders it inevitable that the main submarine effort must continue to be concentrated in the above critical area.

12. Even in this critical area it is manifest that the field is relatively large for the maximum number of submarines which the enemy can maintain in it. For example, with the present Admiralty policy (explained below) they are forced to cover all the possible trade routes of approach between the north of Scotland and Ushant.

13. From consideration of the above and all other essential information available, it is apparent that the enemy could not disperse his main submarine campaign into other quarters of the globe without diminishing results in this and all areas to a degree which would mean failure to accomplish the mission of the submarine campaign, which can be nothing else than a final decision of the war.

14. Considerable criticism has been, and still is, concentrated upon the Admiralty for not taking more effective steps and for failing to produce more substantial and visible results. One of the principal demands is for convoys of merchant shipping, and more definite and real protection within the war zone.

The answer, which manifestly is not publicly known, is simply that the necessary vessels are not available, and further that those which are available are suffering from the effects of three years of arduous service.

15. It is insistently asked (was asked by myself) why shipping is not directed to and concentrated at various rendezvous and from these convoyed through the dangerous areas. The answer is the same—the area is too large; the necessary vessels are not available.

16. However, I am now consulting with the director of shipping as to the practicability and advisability of attempting some approach to such a plan in case the United States is able to put in operation sufficient tonnage to warrant it.

17. After trying various methods of controlling shipping the Admiralty now believes the best policy to be one of dispersion. They use about six relatively large avenues or arcs of approach to the United Kingdom and Channel, changing their limits or area periodically if necessity demands.

Generally speaking, one is to the north of Scotland, another to the north of Ireland, and three or four others covering the Irish Sea and Channel. Individual ships coming into any of these areas of approach are instructed, generally before sailing, to cross the twentieth meridian at certain and different latitudes and thence steer certain courses to port.

Digitized by Google

At times in the past they have found one of these avenues of approach free of submarines under such conditions as to lead them to concentrate shipping therein, but invariably the enemy has become aware of the course pursued.

18. The great difficulty in any method of shipping control is communication with the shipping itself and full cooperation by the merchant personnel. The moment a ship is captured the code either becomes dangerous or useless. The merchant code is being continually changed and at all times it can not be counted upon for more than a fortnight. The immense difficulty of changing the code and keeping shipping all over the world in touch with changes is apparent.

19. Continual trouble is experienced with some merchant captains taking the law into their own hands and exhibiting contempt, or at least indifference, for Admiralty instructions. The American liner *New York*, upon which I took passage, furnishes a typical example. She was advised to make Fastnet Light at daylight but she passed it about 9 p. m., thus passing in daylight through the most dangerous area.

20. The Admiralty has had frequent conferences with merchant masters and sought their advice. Their most unanimous demand is "give us a gun and let us look out for ourselves." They are also insistent that it is impracticable for merchant vessels to proceed in formation, at least in any considerable numbers, due principally to difficulty in controlling their speed or to the inexperience of their subordinate officers. With this view I do not personally agree, but believe that with a little experience merchant vessels could safely and sufficiently well steam in open formations.

I might state in this connection that my opinion as to the ability of merchant seamen to handle their ships in convoy came from the fact that I had been associated at one time for three years in instructing young men in navigation and merchant seamanship and I thought I knew those men better than the average officer has an opportunity to know them. At any rate, that opinion turned out, in the end, to be correct. Merchant skippers found no difficulty, under the guidance of a convoy commander, in handling their ships even up to the number of 40, in close formation, 500 yards apart, 1,000 yards between the lines, or maneuvering those ships simultaneously like a school of fish, zigzagging back and forth, in order to get out of the way of submarines. [Continuing reading:]

21. The best protection against the submarine menace for all classes of ships, merchant as well as naval, is speed and zigzagging, not more than 15 minutes on a course. Upon this point no one disagrees, but on the contrary there is absolutely unanimity of opinion.

22. In the absence of adequate patrol craft, particularly destroyers, and until the enemy submarine morale is broken, there is but one sure method of meeting the submarine issue upon which there is also complete unanimity—increased number of merchant bottoms, preferably small.

"More ships! More ships! More ships!" is heard on every hand.

23. It is also significant that until very recently the admiralty have been unable completely to convince some members of the cabinet that the submarine issue is the deciding factor in the war. The civilian mind, here as at home, is loath to believe in unseen dangers, particularly until the pinch is felt in real physical ways.

24. The prime minister only two days ago expressed to me the opinion that it ought to be possible to find physical means of absolutely sealing up all excape for submarines from ther own ports. The fact that all such methods (nets, mines, obstructions, etc.) inherently involve the added necessity of continuous protection and maintenance by our own naval forces is seldom understood and appreciated. I finally convinced the prime minister of the fallacy of such propositions by describing the situation into which we would be led, namely, that in order to maintain our obstructions we would have to match the forces the enemy brought against them until finally the majority if not all of our forces would be forced into dangerous areas where they would be subject to continual torpedo and other attacks, in fact, in a position most favorable to the enemy.

25. Entirely outside of the fact that the enemy does and always can force exits and thereby nullify the close blockage, the weather is a serious added difficulty. The heaviest anchors obtainable have been used for nets, mines, and obstructions, only to have the arduous work of weeks swept away in a few hours of heavy weather. Moorings will not hold. They chafe through. In this respect we could be of great assistance; i. e., in supply of moorings and buoys.

Digitized by Google

26. The channel is not now, nd never has been, completely sealed against submarine egress, let alone the vaster areas of escape to the north. Submarines have gone into mine fields and have succeeded in unknown ways in evading and cutting through nets and obstructions.

27. In addition to submarines, heavy forces are free to raid and in fact escape through the channel at any time when the enemy decides that the necessity or return will justify the risk. Hence the suggestion that two divisions of our fast dreadnaughts might be based upon Brest primarily for the resulting moral effect against such possible raids.

I was told yesterday by an important Admiralty official that while he thought the chances of raids in or escape through the channel by heavy enemy forces out of reach of the Grand Fleet (north of Scotland) were very remote, nevertheless the possibility existed and was principally thwarted on moral grounds; that is, the uncertainty in his mind of the opposition which would be encountered. He agreed with others, including the first sea lord, that the addition of some of our heavy forces to those maintained in southern channel approaches by the French and British would undoubtedly entirely preclude the possibility of such raids.

28. *Submarine losses.*—It has been found necessary to accept no reports of submarine losses as authentic and certain unless survivors are captured or the submarine itself definitely located by dragging. No dependence even is placed upon evidence of oil on the surface after a submarine has been attacked and forced down as there is reason to believe that when an enemy submarine dives to escape gunfire she is fitted to expel oil for the particular purpose of conveying the impression that she has been sunk and thereby avoid further pursuit.

It has been shown that the amount of damage a submarine can stand is surprising and much more than was anticipated before the experience of the war. Upon a recent occasion a British submarine was mistaken for an enemy and though struck by several shells, dove and escaped to port.

The submarine losses which are certain since the outbreak of war are as given in attached cablegram.

It is estimated that between 30 and 40 submarines operate at a time in the waters surrounding the British islands and French coast. At least one is now known to be on White Sea trade lanes.

The next heading is "Best antisubmarine weapons." This and the next two headings in this letter cover purely technical details, which, with the permission of the committee, I will not read, but simply let them go into the record.

I might say in connection with the last statement that between 30 and 40 submarines were operating to the westward, that it was believed to be true at that time, the belief being based upon what experience they had had; but it turned out later that that estimate was at least twice too large. There were seldom more than 25 submarines that were away from the base at any one time, and the average number of submarines that operated to the west of Ireland was between 8 and 9. I have known it to be as high as 15, and sometimes down as low as 1, 2, or 3. The reason that false estimate was made was because nobody in any navy in the world knew what the submarine was going to be able to do. Admiral von Tirpitz explains in his book that they had to carry out very careful experiments to prove that the submarine could stay out for 10 or 11 days. He did not imagine that they would be able to stay out 30 days to 3 months, nor did anybody in our Navy or any other navy. We had it all to find out.

(The remaining portion of the preceding letter, not read by Admiral Sims, is here printed in the record as follows:)

29. *Best antisubmarine weapons.*—One of the most efficient weapons now used by all destroyers and patrol craft against submarines is the so-called "depth charge," sample and drawings of which have been forwarded by our naval attaché. These are merely explosive charges designed to explode at a certain depth, formerly 80 feet, now about 100 feet. They are dropped overboard where a submarine that has submerged is assumed to be and are counted upon to badly shake up and demoralize it they do not actually cause serious damage.

Digitized by Google

Howitzers and bomb throwers of large caliber are under construction designed to throw similar depth charges to distances of about 2,000 yards. Details will be forwarded.

30. *Torpedo protection.*—This subject may be summed up by the statement of the captain of a British dreadnought who said in effect that after a year's experience he did not fear being sunk by a torpedo. Unless struck by several the worst to be anticipated is damage to shafts or rudder thus necessitating towing. Cruisers have often been struck and been able to reach port. Vital water-tight doors are kept continuously closed at sea.

Destroyer officers have been heard to express the curious opinion that the enemy ships were more or less unsinkable. This is probably to be axplained by the fact that they carry very few supplies; that they have their storage spaces compartmented or filled with wood or other water excluding material; and that, when in port, they quarter their crews in barracks and when leaving for a cruise carry the minimum amount of berthing and supply facilities. These points, however, are not positively known.

On the contrary, all vessels of the British fleet must be kept fully supplied and fueled at all times for extended cruising. This is particularly true of battle cruisers and cruisers.

31. All officers of rank and actual experience consulted are convinced that the enemy have no unusual methods of protection or in fact any surprises or ordnance or other fighting equipment.

32. All are agreed that the best protection against torpedoes is speed and zigzaging.

33. It is a common experience of the naval as well as merchant service that torpedo wakes are reported where none exist. Many reports are received of torpedoes barely missing ships. This was true in the Jutland battle. The captain on one battleship said that he received numerous reports of torpedoes passing just ahead and just astern, nearly all of which he had reason to believe did not exist.

Streaks of suds, slicks, etc., are very deceiving and are easily mistaken for torpedo wakes, particularly when the danger of torpedoes is present. This accounts for many reports by passengers on liners and other merchant craft of seeing many torpedoes just miss their mark.

34. *Submarine versus submarines.*—There has always been opposition to using submarines against submarines principally on the grounds that the possibilities of their accomplishments would not be sufficiently great to justify the risk involved of mistaken identity and resulting damage to friends.

The director of antisubmarine warfare believes, however, that such operations promise well and the experiment is now being tried with as many submarines as can be spared from the Grand Fleet. Some enemy submarines have been destroyed by this method, usually torpedoed. One valuable feature of this method lies in the fact that as long as our submarines are not so used, the enemy submarine is always perfectly safe in assuming that all submarines sighted are friends. If this certainty is removed, the enemy will be forced to keep down more and to take much greater precautions against detection. This is an advantage of no small amount.

In addition to the possible offensive work that may be accomplished by our submarines on such duty, the plan furnishes us with more reliable information as to the limitations and capabilities of enemy vessles under the actual conditions existing in the areas in which they operate. Without this knowledge based on actual experience too much is left to conjecture, which is liable to lead to a great deal of misdirected effort.

WM. S. SIMS.

Before reading selections from my reports to the Navy Department, during the first four months of our participation in the war, it is necessary that I should stop here and present a few facts and figures which will establish the critical tonnage situation which existed at the time we entered the war. These statistics are susceptible of substantiation in the archives of numerous Government departments in Washington, and if there is any inclination to question them, they can be further substantiated by a long train of witnesses of prominent Government officials.

In my letter of January 7, paragraphs 38, 41, 20, 21, and 22 I referred to the tonnage situation which I am about to explain.

I submit here certain charts showing the situation, which can be included or not. There are certain curves which show what the

Digitized by Google

situation was at that time and the result of a summary which gives the figures.

The CHAIRMAN. Do I understand that you wish to have these papers appear in the record?

Admiral SIMS. I think those had better appear in the record, as they show very clearly what the situation is. This is an advanced statement of what the tonnage situation was at the time and how very serious it was. [Reading:]

Statistical analysis of results of delays in getting the United States Navy into action.

	Tons.
Tonnage available to Allies, 1914 (American tonnage not included).....	31,500,000
Total imports of Europe, 1914 (not including imports of Russia and Central Powers) (annually).....	170,000,000
Tonnage required for these imports.....	25,000,000

TONNAGE LOSSES.

Allied net losses, Aug. 1, 1914, to Jan. 1, 1917.....	400,000
Net losses, first quarter, 1917.....	1,300,000
Net losses, April, 1917.....	800,000
Minimum imports required by Europe (annually).....	100,000,000
Tonnage required for these imports.....	18,000,000
Tonnage required for military and naval uses (in addition to tonnage required for imports).....	8,500,000
Absolute minimum of tonnage necessary to allied cause.....	26,500,000
Tonnage available to Allies, Jan. 1, 1917.....	31,100,000
Net losses Jan. 1 to May 1, 1917.....	2,100,000
Tonnage not available because of damage or repairs.....	2,000,000
Net tonnage available to Allies May 1, 1917.....	27,000,000
(I) Average monthly tonnage losses Feb. 1, 1917, to Aug. 1, 1917.....	640,000
(II) Average monthly losses Aug. 1, 1917, to Feb. 1, 1918.....	390,000
(III) Average monthly losses Feb. 1, 1918, to N9v. 11, 1918.....	250,000

That, for reference, will give you a general summary of the situation.

Admiral SIMS. I am submitting to the committee an estimate based upon the data available of the losses caused the Allies and the United States by the delays in getting American naval forces into action against the enemy submarines.

The figures which I have before me show clearly that in April, 1917, the allied cause seemed doomed on account of the losses of tonnage. In the first four months of the year there had been a net loss of over 2,000,000 tons, or 7 per cent of the total allied and neutral shipping, and the rate of losses had been increasing every month. In the month of April alone the net loss amounted to 800,000 tons, or twice as much as in the whole period of the war before January 1, 1917. It was apparent that these losses, if continued, would soon reduce the tonnage to such an extent that military requirements, and requirements of the population of the allied countries, could not longer be maintained. The imports had already been reduced by 40 per cent from the prewar figures. They could not be reduced further without starving the armies or the civil populations of the allied countries. Any further reduction at the rate then existing would have made it impossible to have transported an American army or to maintain it when once across.

With the adoption of the convoy system, and the antisubmarine measures put into effect by the Allies with our assistance in 1917, the

Digitized by Google

losses were gradually reduced until in October, 1918, they amounted to only 100,000 tons. The period between the beginning of the German unrestricted submarine campaign and the armistice can be divided into three phases so far as losses of merchant tonnage are concerned:

First. The period from February 1, 1917, to the end of July, 1917, when American aid was lacking and when shipping was not being convoyed. Average losses, 640,000 tons per month.

Second. The period of August 1, 1917, to February 1, 1918, when there was a partial employment of the convoy system and moderate assistance from America. Losses, 390,000 tons per month.

Third. The period from February 1, 1918, to the armistice, when full cooperation was given by America, and consequently full use could be made of the convoy system. Losses, 250,000 tons per month.

As will be noted, each of these successive phases of the unrestricted submarine campaign is marked by the degree of naval cooperation received from America. An analysis of the situation, therefore, shows that if the United States Navy had been prepared for war when war began, and if a whole-hearted policy of cooperation with the Allies had been followed from the beginning, the first period mentioned above would have come to an end within a month after we entered the war; that is, by May 1, 1917. The second period would probably have ended by August 1, as by that time the full weight of our cooperation would probably have been felt. An estimate of the amount of tonnage that would have been saved by prompt action on our part, shows, therefore, that, if the first period had ended on May 1, and the second period on August 1, 1917, a million and a half tons of shipping would have been saved to the Allies in 1917. Similarly, at least another million tons would have been saved in 1918.

It can thus be said that the failure of the Navy Department to enter the war immediately and whole-heartedly cost the allied cause as a whole 2,500,000 tons of shipping sunk unnecessarily. While this is of course an estimate only, it is based upon actual results obtained when our help became effective, and there is no reason to doubt that it is a conservative estimate.

The loss of this amount of shipping can also be translated into a definite prolongation of the war and unnecessary sacrifice of blood and treasure in accomplishing the victory. As Gen. Pershing clearly shows in his report to the Secretary of War, the primary consideration limiting the number of American troops that could be sent to France was that of tonnage. The tonnage losses of 1917 made it impossible at the time to transport any considerable American Army and, at the same time, continue the absolutely essential military supplies and food for the civil populations of the allied countries. It therefore became necessary to limit the number of American troops that could be sent abroad during the first year to an average of approximately 25,000 men per month. If the additional million and a half tons sunk unnecessarily in 1917 had been saved by prompt cooperation of our Navy, the number of American soldiers sent to France could have been doubled or trebled. If the tonnage had been available and the additional American troops had been sent to France, and the new drafts called more promptly in this country, America could have had a million men in France by March, 1918, instead of 300,000.

Digitized by Google

A review of the various books by military experts and of the available information concerning the German campaign of 1918, shows that the earlier defeat of the submarine campaign would have had the effect of very greatly shortening the war. The Germans had hoped, and continued to hope until the beginning of 1918, that the submarines would force the Allies to peace. The offensive of 1918 on land was only projected and undertaken when the German staff realized that the submarine could not bring them victory. If, therefore, the tonnage losses had been so reduced by August, 1917, that the defeat of the submarine campaign could have been accomplished, it would, without a doubt, have reacted upon the morale of the German population at that time as it did actually in 1918. The German high command would then have been forced into its desperate military venture earlier than March, 1918, when the offensive was actually launched against the Allies, or would have been forced to endure the victorious assault of the Allies in the early spring of 1918, which, as a result of the losses suffered in the first months of the German offensive, and because of the delay in getting American troops in sufficient number, actually did not begin until the middle of July, 1918. In either of these cases, the presence of a million Americans in France on March 1, and the arrival of another million within another three months, would undoubtedly have brought a victory by July, if one may judge from what actually happened when these American forces did become available, and thus tip the military scale in favor of the Allies.

The loss unnecessarily of the two and a half million tons of shipping, therefore, in all probability postponed the end of the war at least four months. The average loss of life per day to the Allies during the war was 3,000 men. This prolongation of the war, therefore, cost half a million lives. Similarly, as the war cost the allies $100,000,000 a day on the average, this prolongation resulted in the unnecessary expenditure of $15,000,000,000, of which at least one-third was expended by the United States directly or loaned to the Allies.

I have made this statement not because I assume or pretend that it is complete, but in order to present to you some estimate of what such a policy as that of the Navy Department in the first six months of the war, and of such delays and military errors as those committed by the department in this same time cost the Nation and the Allies. I merely wish to call your attention as vividly as possible to the fact that the questions under discussion are not purely academic, but have the vastest consequences that must inevitably be suffered unnecessarily if such mistakes are committed in time of war. It is no light matter which cost the cause for which we were fighting half a million lives, fifteen billions of dollars, and two and a half million tons of shipping.

I will now read to the committee selections from my various dispatches sent during the first four months, together with certain dispatches from other important Government officials, for the purpose of clearly establishing that the department was fully informed of the unprecedented and critical nature of the war situation at the time this country decided to enter.

Digitized by Google

I wish to point out that the official documents I am about to read are but a few of those which I sent and which are available in the records. An attempt has been made merely to select typical messages. These messages which I shall now read you are in substantion of paragraphs 10, 11, 12, 13, 26, and 27 of my letter, which is the subject of this inquiry.

I would like to say in connection with these dispatches that in order to take a certain subject and discuss it it is necessary, of course, to introduce the dispatches which substantiate the statement. Almost all of those dispatches contain remarks on different subjects. To include and read the whole dispatch would unnecessarily lengthen the record and would be very boring.

It is also my intention to include only any portion of a dispatch which bears on the subject in hand, but if, after I finish my testimony, the committee desires to have a complete file of these dispatches so that they can read any dispatch in its entirety, I can submit them. That will add considerably to the length of the record, but they may be submitted if desired.

The CHAIRMAN. We can determine that afterwards.

Admiral SIMS. Yes. To give you an idea of the magnitude of the job, I may say that I do not know how many dispatches there were, but they are in the hundreds of thousands. I asked my statistician some time ago how many there were, and he said that if they were bounds up in boards and set on a shelf that shelf would have to be 140 feet long in order to contain them. Of course, the committee does not want them all.

Senator TRAMMELL. They are all dispatches that are on file in the department?

Admiral SIMS. Yes, they are all on file in the department.

Senator TRAMMELL. And your references will refer to the particular numbers, so that they can be found?

Admiral SIMS. Out of those miles of dispatches I am only selecting representative ones, and out of those representative ones I am selecting those that illustrate the point in question; and of all of those dispatches, of which there are probably 200,000, I am only selecting a certain number, and those can be included; and if, after my testimony is concluded, you decide that it would be advisable, you can put them in in full; but in the meantime there are only extracts from these dispatches.

Senator TRAMMELL. Will you refer to them under the file number so that they can be identified?

Admiral SIMS. I will refer to them by dates, and will give you the file numbers also, if you need them, and by numbers also.

On the same day that I sent my first dispatch to the department, covering the whole situation, I also sent a second dispatch to emphasize the exactness of the information and the importance of the recommendations given in the first cable. This second dispatch was as follows:

[Cable to Department, April 14, 1917.]

The dispatch referred to gives the exact truth of the situation, and the information given is not even known to the majority of British officials. I have absolutely insisted upon the importance of a complete and accurate statement of the true situation, and the authorities have finally given their consent, but only after reference to the Imperial

Digitized by Google

War Council, this because of the manifest advantage to enemy morale if the information were disclosed. I request with all possible urgency your immediate consideration of these recommendations.

SIMS.

I may say with reference to the importance of keeping your information away from the enemy, that I read a dispatch in the paper in which the Government officials in Berlin read aloud the account of my interview with Admiral Jellicoe, and the statement in a magazine article as to what the situation was, and they listened to this language with melancholy interest.

After sending this disptach, I learned by accident on the following day, while in Admiral Jellicoe's office, that the Navy Department had made an agreement, as I will point out later in my testimony, with the local representatives of the British and French Navies in Washington with regard to the extent of American naval cooperation. I never received from the department any information concerning this agreement, as I will point out later in my testimony. At this point I merely wish to emphasize the fact that one clause in the agreement shown me by Admiral Jellicoe was to the effect that the Navy Department would send a division of destroyers to base either upon a French or British port. I thereupon sent to the department on the 16th of April the following message:

APRIL 16—*11 p. m.*

To: Secretary of State, Washington.
For: Secretary of Navy.

Strongly advise that any destroyer or other patrol forces sent this side do not base on French coast but as far to westward as practicable, preferably south coast Ireland, to operate principally in designated high-sea area in zone to westward and southward, which is present critical area.

SIMS.

Two days later, on April 18, in replying to a suggestion of the Navy Department as to the feasibility of blocking the German submarines in their bases, which will also be taken up later, I again pointed out the importance of immediate naval cooperation.

[Cablegram to Navy Department, April 18, 1917.]

The destroyer has shown itself to be to a great degree the most efficacious enemy of the submarines attacking commerce. All possible means are taken by the enemy to force their being assigned to other duty, even to sink ships on hospital service. With the exception of the minimum number required by the Grand Fleet, for carrying troops and their supplies, all destroyers are now so used. These vessels are being constructed as expeditiously as possible, but their number is quite insufficient to meet the existing submarine crisis, particularly as it affects merchantmen.

In view of the seriousness of the situation I urgently repeat the recommendations that we send at once every destroyer that can reach Ireland as well as all light draft ships of whatever speed, able to perform any patrol service.

In other dispatches of about this same time, on April 15, 17, 22, 23, and 24, I again called attention to my early recommendations and repeated requests for forces.

On April 16 I had received from the Navy Department a message requesting technical information, at the end of which was the following sentence:

Yours of noon 14th April will be given earnest and serious attention.

In spite of this assurance from the department, the only messages that I received concerning the sending of forces abroad in April

Digitized by Google

were the two messages which I shall now read you, which were both received on April 22:

From: Operations.
To: Rear Admiral Sims.
Received April 22, 1917.

Six destroyers are ready to sail immediately upon receiving information as to desired port and best route to follow as they approach the Irish coast. Give full information.

BENSON.

From: Secretary of the Navy.
To: Rear Admiral W. S. Sims.
Cablegram received: April 22, 1917.

The United States has been requested by the Russian Government to send four patrol vessels and four destroyers to the Arctic coast for the defense of that region. It is understood that assistance is urgently required at the earliest possible moment. Please confer with the British authorities as to the situation and wire what you advise.

DANIELS, *Secretary of Navy.*

It is to be seen from the second of these messages how little importance the department had apparently given to my recommendations. In my first dispatch and in later dispatches I had emphasized the absolute necessity of concentrating all available American antisubmarine craft in the critical area of the submarine zone south of Ireland. Yet the department entertained the possibility of sending four destroyers and four patrol vessels to the Arctic coast at a time when, so far as I knew, they were intending to send only one division of destroyers to the critical zone.

I immediately replied to this message with my dispatch of April 24:

Sent April 24, 10 a. m.
To: Secretary of the Navy.
Through: State Department.

Strictly confidential. Replying to department's April 22: Have consulted Admiralty. Conclusion reached is that our destroyers and patrol forces should operate concentrated in same area, based on Bantry Bay, with all possible repair and supply facilities. Effort would be diminished by separation and necessary establishment additional bases. If this is done, Admiralty can augment submarine defense Russian coast from their present bases. Submarines and decoy vessels already sent this duty. Situation continues critical. Nine vessels sunk yesterday. Recommend that all destroyers now available be sent earliest possible date, if necessary in advance their repair and supply vessels. Admiralty can supply and repair temporarily.

SIMS.

On April 26 I received a message announcing the sailing of six destroyers from Boston on April 24, but containing no further information with regard to other forces.

My despair can be imagined.

I felt there was no way to explain the situation any more clearly than I had already done in dispatches to the department. Nevertheless, I did send one more message, which follows:

[Cable to department.]

Sent April 27, 1917.
To: Secretary of the Navy.
Through: State Department.

The information which follows must be guarded with the greatest secrecy. In spite of the effort of all destroyers and patrol vessels which are available, the situation is increasingly critical. Eighty-eight ships, amounting to 237,000 tons (not taking into account the fishing vessels), of British, Allied, and neutral nationality were sunk during the week ending April 22. There is a greatly increased number of ships which are unsuccessfully attacked by enemy submarines. This indicates that there is a correspondingly increased number of submarines operating.

SIMS.

Digitized by Google

I had no reason, however, to believe that this one additional message would bring the action necessary. But something had to be done. The issues at stake were too great for me to be satisfied with the action so far taken.

One other course seemed to be open. My representative capacity abroad in a sense placed me under the ambassador. Throughout my service abroad I always considered it a duty to keep the State Department representative generally informed of the military situation.

In this case I made an urgent appeal to the ambassador, asking him to support me in an attempt to get our Government to realize the necessities of the situation. I submitted a memorandum to the ambassador, from which I might read the following extracts:

Memo. for Ambassador Page, April 27, 1917.

During week ending April 22, 88 ships, 240,000 tonnage, lost; number of vessels unsuccessfully attacked show marked increase in number of submarines operating. Every available destroyer and other suitable vessel now employed, even to point of reducing superiority of British Grand Fleet over enemy Grand Fleet. Allies do not now command sea. Transport of troops and supplies strained to utmost, and maintenance armies in field threatened.

Regardless of any form of cooperation by United States in future, including increased shipping and reinforcement of armies in field, it is imperative that we supply at the earliest possible date all destroyers and other craft suitable for opposing submarines and able to reach this side. Opportunity presented for United States to prove deciding factor in war by immediate maximum cooperation in suppressing enemy submarine campaign.

On the same day—i. e., on April 27—the ambassador sent the following message to the State Department:

From: Ambassador Page.
To: Secretary of State.
Sent: April 27, 1917.

Very confidential for Secretary and President. There is reason for the greatest alarm about the issue of the war caused by the increasing success of the German submarines. I have it from official sources that during the week ending April 22, 88 ships of 237,000 tons, allied and neutral, were lost. The number of vessels unsuccessfully attacked indicated a great increase in the number of submarines in action. This means practically a million tons lost every month till the shorter days of autumn come. By that time the sea will be about clear of shipping. Most of the ships are sunk to the westward and southward of Ireland. The British have in that area every available antisubmarine craft, but their force is so insufficient that they hardly discourage the submarines. The British transport of troops and supplies is already strained to the utmost, and the maintenance of the armies in the field is threatened. There is food enough here to last the civil population not more than six weeks or two months.

Whatever help the United States may render at any time in the future or in any theater of the war, our help is now more seriously needed in this submarine area for the sake of all the Allies than it can ever be needed again, or anywhere else. After talking over this critical situation with the prime minister and other members of the Government, I can not refrain from most strongly recommending the immediate sending over of every destroyer and all other craft that can be of antisubmarine use. This seems to me the sharpest crisis of the war and the most dangerous situation for the Allies that has arisen or could arise. If enough submarines can be destroyed in the next two or three months, the war will be won, and if we can contribute effective help immediately it will be won directly by our aid. I can not exaggerate the pressing and increasing danger of this situation. Thirty or more destroyers and other similar craft sent by us immediately would very likely be decisive. There is no time to be lost.

PAGE.

I immediately followed this up on the next day by sending to the Navy Department another long dispatch covering the whole situation and repeating again the urgent necessity of immediate naval cooperation:

Digitized by Google

APRIL 28.

Owing to the gravity of the submarine situation, although I am unaware of the situation as regards our forces available and their material condition, I can not avoid urging the importance of the time element, and the fact that the pressing need of the moment is numbers of vessels in the danger area. We can not send too soon or too many. If the rate of losses given last week is continued, any other further means of cooperation including shipping may be too late. The intensity of the submarine campaign shows now, and within the next two months, is the critical time. Military opinion all points to the breaking of enemy submarine morale as the immediate mission. Since the British are concentrating more forces in the critical zone, I can not exaggerate the importance of our force being immediately followed by adequate facilities for supply and repair, especially for all needs and for all special repairs. At Queenstown and the neighboring bases because of the volume of work and lack of labor, facilities will be greatly overstrained.

With regard to submarines entering and leaving their bases and their approximately whereabouts while operating, the admiralty is able to maintain information that is fairly exact.

Of the 34 mine U-boats, two for some days were not located, and the Admiralty was on the point of informing us of the probability of their being en route to the United States when their whereabouts were discovered. It is the Admiralty's belief now that at present none are likely to be sent over and that the present effort of the submarine which is successful will be kept up off the channel entrance. All of the destroyers which can be freed from duty with the fleet are being employed. It has been shown by experience that 50 per cent of the destroyers can be maintained on patrol. The area covered by destroyers is practically untenable by submarines but this area is ineffective as it is too small. Yesterday the war council and Admiralty decided that cooperation of twenty-odd American destroyers with base at Queenstown would no doubt put down the present submarine activity which is dangerous, and keep it down.

That, of course, refers to that particular area.

The crisis will be passed if the enemy can be forced to disperse his forces from this crucial zone.

I believe our Navy has an opportunity for glorious distinction and I seriously recommend that there be sent at once maximum possible number destroyers. Depth charges and all supplies necessary will be furnished the six destroyers now en route and there will be assigned to the staff of our senior officer an expert destroyer patrol officer.

SIMS.

A little bit later I was able to inform the department that I could give them more accurate information about the movements of submarines, and when we come to consider the question further along of the defense of our coast, I think I can show you some of the most remarkable examples of secret intelligence work that ever have been recorded in any military history. I will explain to you, there, to a certain extent, how it was that I was able to assure the department that no submarine would leave the other side without the department being warned; and it turned out to be so. No submarine left the other side without the Navy Department having at least two weeks warning. and being told where she was at least every two or three days, and being told what her name was, what her number was, and in one case what the name of her commanding officer was; where she was going and what she was going to do; and it all turned out to be perfectly correct.

On the following day I received orders placing me in command of the forces which were being sent, namely, six destroyers, in addition to my other duties as the department's representative abroad.

On May 3, a whole month after we declared war, apparently as a result of the dispatches sent on April 27 and 28, the department sent me the first message giving me any intimation as to the extent of the forces they intended to send. This message was as follows:

Digitized by Google

From: Secretary of the Navy.
To: Rear Admiral Sims.
Received May 3, 1917.

Berehaven suggested by the British commission in Washington as a base for the United States destroyers which are operating with the Allies. Ultimately there will be 36 destroyers sent, as well as the *Melville*, and also the *Dixie* should the latter be required. Send recommendations after investigating the place as to what equipment it would be necessary to furnish for use on shore for housing stores, and whether the equipment is obtainable there. Is there available any floating equipment or storage for oil? What kind of stores can be obtained there? Report in general what kind of stores should be shipped from here in addition to the stores which are generally carried by the destroyer tenders. Can oil be obtained from any nearby fleet base for the destroyers? We could replenish the stock used by sending our oil tankers, or must the supply be from tankers sent from this side to Berehaven?

The *Dixie* was a mother ship.

In reference to that dispatch I should like to call attention to the fact that the first real decision that came from the Navy Department as to participation in the war was not until one month, nearly, after we entered the war.

I would call attention to a few features of this dispatch:

First. Its indefiniteness. The fact that ultimately 36 destroyers would be sent was little satisfaction. Time was everything. Did it mean weeks or months?

Second. That the majority of the information requested therein should have been thoroughly worked out in our war plans.

Third. I wish to indicate to the committee the nature of the task presented to me, with one aid, with no data or record as to our own forces of any description at hand, to attempt to obtain this information in the time available from the various parts of the British Isles.

I will take up, of course, the question of personnel as a separate matter later.

I replied to this message on May 7 with the following dispatch:

[Cables sent to Department May 7, 1917.]

Berehaven is now established, defended, and used as advanced base, and is suitable for our purpose in the present area of main activies of submarines. The British and French agree that our destroyer force should remain concentrated upon its own supply and repair ships; that it should remain essentially a mobile force ready to follow shifting of area of main submarine activity. The British will give us any necessary supplies and assistance, but their facilities for repair and supply are strained nearly to the limit. Therefore I urge that our force be as self-contained as possible; that both the *Melville* and *Dixie* be sent with complete stores as for extended West Indian cruise; also that supply ships be sent with meat, provisions, and stores to replenish the repair ships. In addition to usual stores carried by our repair ships, we should send in supply ships such stores as our experience indicates will be necessary, such as boiler and condenser tubes, spare parts, piping, repair material, etc.

Depth charges as per drawing forwarded about 8th April should be made and forwarded as soon as practicable to relieve present drain on British supply for their destroyers and patrol craft. Oil will be supplied from small oilers from British oil stations to our destroyers wherever based. Oil situation becoming critical. We should therefore maintain a continuous supply from our large oil tankers discharging into their main tank stations, so as not to detain large tankers at advanced bases. The essential requirement is that our force should be not only as self-sustaining as possible but also mobile. There are no special equipments necessary for housing stores ashore.

During the first week in May I went to Paris, at the request of the British and French naval authorities, to attend a conference with regard to naval cooperation, which was held in connection with a meeting of the allied military council. I informed the Navy Department of the result of these conferences in a dispatch sent on May 5 from Paris.

Digitized by Google

This dispatch is as follows:

[Cable sent Navy Department, May 5, 1917.]

Relations with the French Navy Department very satisfactory. Conference with minister and chief of staff and French attaché London and attaché Paris and first Sea Lord resulted in unanimous agreement that our destroyer force should remain concentrated and should attack the enemy submarines in whatever area they may be operating in the greatest numbers. Probably principally in the area from the South to the West Northwest of Fastnet.

SIMS.

The next intimation which I received from the department of their probable plans was in a dispatch of May 8:

Cablegram, from Secretary of the Navy.
To: Rear Admiral Sims.
Received May 8, 1917.

The French have requested and United States Navy Department contemplates, establishing temporary bases at Bordeaux and Brest, with one line officer, one pay officer and one engineer officer. You are requested to advise on this and it is requested that your reply be expedited.

DANIELS.

I replied to this on the same day.

Sent May 8, 1917.

To: Secretary of State, Washington.
Through: State Department.

Following from the Admiral to Navy Department:

Establishment of temporary bases Brest and Bordeaux very desirable but should not divert in any way necessary repair supply and fuel vessels from mobile destroyer base. Urgent that destroyer force remain concentrated with mobile base ready to follow any movement of main submarine activity on high sea trade routes.

SIMS.

Throughout the remainder of the month of May, and for the first three weeks of June, I continued to send, at frequent intervals, cables reiterating recommendations made from the time of my first cable, but received no further reply from the Navy Department regarding their plans and policies and forces to be sent abroad until June 20, although throughout this period I was in daily conference with the heads of the allied navies. You can imagine my embarrassment in all discussions, owing to my inability to make any positive statement whatever as to what the United States Navy proposed to do; and, as I will point out at a later time, in dealing with the department's direct negotiations with allies during this period. I was receiving most of my information with regard to American naval plans and the disposition of American naval forces accidentally through information seen in the Admiralty or related to me by visiting armed guard officers.

In this series of messages which I now propose to read, I must in order not to confuse the situation adhere to the point we are discussing. There are a great many very important things which I will take up later, for example, the convoy system, which at this period was pressing hard, but I wish now to deal only with the question of reinforcements.

From among the many messages sent during May and June, in which I was pointing out the increasingly critical character of the situation and repeated my recommendations for the sending of anti-submarine craft, I will read portions of my dispatches of May 14, May 31, June 7, June 14, and June 20:

Digitized by Google

I am giving portions of these dispatches in order (1) to save time, and (2) in order to avoid confusion. Many dispatches referred to a number of subjects. It is therefore better to read only the portion which refers to the subject now under consideration. I can, however, if the committee desires, submit a separate list of all dispatches and letters from which these extracts were taken. Of course, these cables and letters are only a few representative ones to give you an idea of the situation in each case. It would take literally months to read all the cables. They are up in the hundreds of thousands. If bound into books the cables alone would occupy about 140 feet of shelf room. As for the letters, they would fill 100 letter-file cases of 4 long drawers each.

[Cable sent Department May 14, 1917.]

Every effort is being made to increase the British patrols. The measures we take must be carried out with utmost dispatch in view of the critical degree of enemy submarine successes and the general allied military and political situation. The element of time is all important. The need is for destroyers, antisubmarine craft, tugs, and mine layers in the greatest possible numbers. The British Government deeply appreciate the evidence of America's desire to assist in putting down the submarine menace.

Incidentally, that can be considered as only as instance of international politeness, because they are thanking us for sending 6 destroyers at this late date.

The primary necessity is numbers of patrol craft, and as previously reported, too much stress can not be laid upon the urgency of reinforcing the allied antisubmarine forces to the extreme possible limit.

SIMS.

These are only extracts from a few of these cables.

[Cable sent to Department May 31, 1917.]

With the increase of the available antisubmarine craft, the enemy is being forced to attack by torpedo instead of gun fire, and this results in shorter cruises and more uncertain dates of return to bases, and difficulty in maintaining definite prearranged programs. Hence we may expect from now on alternative periods of greater and lesser activity. The Admiralty desires to report officially that the United States destroyer forces working on Atlantic approaches are rendering most efficient and valuable services.

[Cable sent to Department June 7, 1917.]

Request information of any further additions to our forces here or in France and prospective dates sailing. The great necessity is numbers of antisubmarine craft the greater the number the more effective the offensive campaign. Also request general information as to department's policy concerning fleet and other service vessels. Nothing now under consideration as regards their use this side, but would like to be generally informed in case future development or emergencies should bring the question up.

SIMS.

From: Vice Admiral Sims.
To: Secretary of Navy.
Via: Naval attaché, Washington.
Through: Admiralty.
Sent: June 14, 1917.

Following for United States Chief of Naval Operations from Vive Admiral Sims begins general situation and prospects for immediate future very grave. All fuel, food, and other supply and Army assistance which we can render is entirely dependent upon ability to insure safe passage through dangerous submarine areas this side. The prospects of the immediate future and available vessels for escort duty is cause for great concern. Whatever is done to meet the situation must be done immediately. Our help is very much needed. The difficulties confronting the entire convoy situation are serious and primarily depend upon the question of escorts through submarine

Digitized by Google

zones. There are not now sufficient vessels available for escort duty to ensure safety of all vital supplies and also prospective movements of our troops and their supplies. As our troops and their supplies will approach European coast outside of zones used by shipping and shipping convoys it is mandatory that information be given immediately as to the probable numbers and times of sailing of all Army shipping in next three months as on this depends the programme of merchant ship convoys which must be arranged some time ahead. The approach of our first Army convoys will seriously embarrass the shipping situation as it will require all destroyers based on Queenstown thus necessitating entire suspension of patrol and escort duty in that area. I can not lay too much stress upon the urgent necessity of increasing the destroyer and other patrol forces here with utmost despatch. Can not other craft be sent also? Anything armed which can make above 12 knots and keep the sea will relieve the situation. Our shipping and our coast is better protected in the field of enemy activity than in any other place.

Urgently request answer in next 24 hours if possible as to prospective movements of all Army shipping in next two or three months. This information is of vital importance. Also request information as to probable additions to antisubmarine forces these waters. The Admiralty informs me that present prospect is that if oil supplies are protected food supplies can not be. I again urgently recommend that all destroyers that can be brought to the coast of Ireland be sent at once.

SIMS.

Sent: June 20, 1917.

To: Secretary of the Navy.
(Through Admiralty.)

The immediate dispatch to this area of all possible destroyers and antisubmarine craft of any description is mandatory if the submarine issue is to be effectively met. During absence of destroyers for escort duty with troops transports the forces in this area reduced to only 10 destroyers and 10 sloops, only 6 of each in operation at a time. This requires five days at sea with two days in port, which can not be continued with reliability. Other areas are similarly short of sufficient forces to meet the situation. Yesterday the majority of these forces were engaged in escorting individual inward-bound valuable ships, thereby leaving all shipping following them unprotected. Ships sunk yesterday as far west as 17:30. It will seem suicidal if the convoy system as proposed by the British Admiralty is not put into immediate operation and applied to all shipping, thus forcing submarines to encounter antisubmarine craft in order to attack shipping. It is impossible to carry on partial convoy and partial patrol system. Both can not be done. The former much better than present system, which is not succeeding. Urgently request information of department's action on this dispatch and upon previous similar dispatches. A decision is necessary before decisive action can be taken on this side.

SIMS.

That refers largely to the convoys. I will show you later, when I take up the convoys as a separate subject, the opposition of the United States to the introduction of the convoy system.

In reply to the increasingly urgent series of messages in June, I finally received a message from the department, on June 20, which I will now read to you:

Received: June 20, 1917, via Admiralty.

To: Commander in Chief; Queenstown.
Following for Admiral Sims:

Begins. There will be no additional movements before August of troops. You will be furnished fully with information as to sailing of Army supply ships as far as possible in advance, and the actual sailing intended route and probably dates of arrival will be reported. We hope to sail four Army supply ships now fitting out in about 10 days' time. The 32 destroyers, which are all that are available, have sailed; 110-feet chasers, which are to be sent to France, should begin to deliver in August. Fishing vessels, 12 in number, will sail in August for France. There are no other small craft available at present, although work on yachts is being pushed, probably ready 15th July. In regard to convoy, I consider that American vessels having armed guards are safer when sailing independently.

DANIELS.

Digitized by Google

I would like to invite particular attention to that last paragraph:

In regard to convoy I consider that American vessels having armed guards are safer when sailing independently.

And that was signed "Daniels."

Well, I can assure you that I was about ready to jump overboard when I got that last message. After all the information that had been sent, as to the nature of the antisubmarine campaign and as to the nature of the submarine campaign, to be informed officially by the Navy Department:

In regard to convoy I consider that American vessels having armed guards are safer when sailing independently.

It will be noted that the previous promise of 36 destroyers had now dwindled to 32, and that this message gave me no hope of receiving any more forces. To anyone who had spent any time at all on the American coast and in our harbors, it was pretty difficult to accept the statement here made that there were no other small craft available. I felt that if the department realized the situation as it really existed, which I had tried so hard to explain, it certainly could have produced more results. Surely a country, that raised our great Army in the time that it did could have produced more naval effort in the space of two and one-half months than this message would indicate.

It should also be noted in passing because I will deal with the subject more at length later, that in reply to my numerous and repeated cables, pointing out that the only way to protect shipping was by the use of the convoy system, the Secretary now replied in the final sentence of this message:

I consider the American vessels having armed guards are safer when sailing independently.

As a matter of fact, two of the first American ships with armed guards on board were sunk at this time, the steamship *Vacuum* and the steamship *Campania*.

When this message came I realized once more that the department did not appreciate the situation, or such a message would have been impossible.

I therefore sent, in the following week, another series of messages, in which I expressed, in the clearest language of which I am capable, the situation as it then existed. I will read you my dispatches of June 21, June 22, and June 23:

Sent June 21:

To: Secretary of the Navy.
(Through Admiralty.)

I trust I have made the critical nature of the military situation entirely clear. I consider it my duty to report that if we can not offer more immediate actual assistance even to the extent of sending the majority of the vessels patrolling our own coast lines, which can not materially affect the general situation, we will fail to render the service to the Allies cause which future history will show to have been necessary.

My recommendations concerning the convoy system were not based upon American vessels, but upon all allied shipping, for it is upon the preservation of the remainder of this shipping that our success against the enemy is entirely dependent. It is assumed here that the comparative immunity of American shipping from submarine attack is due to German hopes that such a policy will strengthen the peace propaganda in America. This is apparently clearly indicated by the German press. Actual and extended experience has shown that arming merchantmen does not protect from attack, but simply forces the submarine to attack without warning, thus obliging her to use up her torpedoes and shorten her cruise.

Digitized by Google

Armed merchantmen are being sunk daily off this port. The success of the convoys so far brought in shows that the system will defeat the submarine campaign if applied generally and in time. The system is merely a plan that obliges the submarine to fight antisubmarine craft in order to attack merchantmen. The present campaign is not succeeding. The necessity is again presented of sending all destroyers, tugs, yachts, and other craft which can reach the critical area by themselves or towed part way by reserve battleships or any naval vessels. If the situation is not made clear I hope the department will indicate the further information desired. Time is a vital element in any measures taken. Ends.

SIMS.

Sent June 22.

To: Secretary of the Navy.
(Through Admiralty.)

I again submit the necessity for increase of antisubmarine forces based on Queenstown in order to insure safe passage of convoys and shipping through this area. This is best area in which all our naval cooperation can be concentrated. It is through this area which the vast majority of mercantile shipping from United States must continue to pass throughout war. All seagoing protection on our own coast line is futile as long as enemy does not attack shipping from our ports in that area. Enemy area of attack must remain in East Atlantic waters to be successful. All material assistance from United States will be dependent upon safe passage of shipping through war zone.

SIMS.

Sent June 23, 1917.

To: Secretary of the Navy via British Admiralty.
From: Vice Admiral Sims, Queenstown.

No. 874. From Vice Admiral Sims for Secretary Navy. Begins. Mystery ships are of little use without motive power. In any case they must simulate merchantmen perfectly in rig and all respects, and should be as nearly unsinkable as possible. The great need is for any type of craft which can keep sea and carry gun and radio. The need is immediate. Losses are not decreasing, while demands on antisubmarine craft are steadily increasing. Numbers of craft in time are the necessities of the situation.

SIMS.

These messages called forth from the department another message, giving the first statement of any policy and the first definite information about the department's plans which I had yet received in two and a half months. This message was as follows:

From: Secretary of Navy.
To: Alusna, London.
For: Vice Admiral Sims, No. 37.
Received: June 24, 1917.
This is a reply to your various letters and cables.

The need of reserve of personnel for such active forces as may be engaged on duties of particularly arduous kinds under conditions permitting of little respite is recognized by the department. This refers particularly to destroyers on active service. There is a limit of the number of trained personnel enlisted and commissioned that can be spared for the reserve indicated above owing to the very heavy demands for this type of men needed for other active operations of most important kinds. However, the department will endeavor to maintain a personnel reserve in your destroyer forces, consisting of something like one-fiftieth of the destroyer complement. This to be supplied from our naval reserves.

Another thing that the department recognizes is the necessity of sending all antisubmarine craft which can be spared from the home waters into active European waters, and when such craft become available will send them. In making the local assignments abroad of such forces, the department requests and will be guided by your advice, which should be given after consultation with the various Admiralties concerned as to priority of requirements.

The department is strongly of the opinion—based on recent experiences—that the question of supplying adequate guns and trained gun crews to merchant ships is one which can in no wise be treated as a minor issue. Coupled with a rigid system of inspection, this method is believed to constitute one of the most effective defensive submarine measures.

Digitized by Google

After all the dispatches and information, after three years of war, to have a dispatch like that come from the Navy Department was one of the most discouraging things in my career. I thought that the average citizen on the street who had been reading the newspaper reports would have known better than to make a statement of that kind. I continued:

It announced, moreover, as its policy its willingness to cooperate in every way, and will consider the question of supplying additional naval forces of types other than antisubmarine craft whenever the advisability of so doing is justified. The department is also considering the outline of a scheme which it is hoped will allow of a greater degree of cooperation and ability to supply escort to vessels through the danger zone without interfering with the destroyers' other duties as much as does the present system of individual escort, and it will not displace the present method of handling merchant shipping from United States ports. Details when prevented (?) will be cabled.

Evidently the word "prevented" means "perfected." (Continuing reading:)

In the matter of construction, the department recognizes the necessity of pushing to the utmost the type of destroyer of the general specification recommended by you, and this it will do. 19023.

DANIELS,
Secretary of the Navy.

I would also call attention to the last sentence of the second paragraph of this dispatch, particularly in view of many public statements to the effect that my position abroad was a purely local one. The quotation referred to is this:

In making the local assignments abroad of such forces, the department requests and will be guided by your advice, which should be given after consultation with the various admiralties concerned as to priority of requirements.

When I received this message I was at Queenstown, commanding the Irish station during the absence of Admiral Bayly on leave; and, in view of the critical losses of ships which were being experienced every day off Queenstown, I felt once again that it was my duty to report to the ambassador the situation and the apparent unwillingness of the department to credit my reports and act upon my recommendations. In addition to sending further cables to the department, I therefore wrote the following letter to the ambassador, asking him once more to present the situation to the State Department.

Cable dispatch sent June 26, 1917:

To: American Ambassador, via Admiralty.
From: Admiral W. S. Sims.

No. 912. Admiral Sims requests delivery following message to American ambassador:

In view of serious character of statements contained in my correspondence forwarded to you by mail to-day suggest that it be confirmed by Cabinet officials before communicating to Washington, with a view of insuring support of British Embassy in Washington in case British Ambassador there is consulted in connection therewith.

[Letter to Ambassador Page.]

QUEENSTOWN, *June 25, 1917.*

MY DEAR AMBASSADOR: I consider it my duty to send you herewith for your information copies of a letter and certain messages which are typical of what I have been sending to the Navy Department.

You will see from the department's only reply, dated June 20, that I am not having any success in getting more vessels sent over into the critical area here.

All of the material assistance being organized by our Government will be futile if we do not take immediate steps to insure safe passage of such essential supplies through the submarine zone, that is, through the enemy's lines.

Digitized by Google

It is useless for us to manufacture, grow, and build munitions, foods, and ships, and assemble and train soldiery, unless at the same time, and in time, we also take effective steps to insure that such measures will safely reach the points where it will help to defeat the enemy. If we attempt to furnish this help in a larger degree than the enemy can sink it, we might perhaps eventually accomplish our purpose, but the grave danger is that the Allies will be brought to terms before such a course could be carried out.

It remains a fact that at present the enemy is succeeding and we are failing. Ships are being sunk faster than they can be replaced by the building facilities of the world. This simply means that the enemy is winning the war. There is no mystery about that. The submarines are rapidly cutting the Allies lines of communication. When they are cut, or sufficiently interfered with, we must accept the enemy's terms.

It is a poor plan, indeed, that does not involve attacking the enemy's war craft or forcing them to attack ours. Stated briefly, the unsuccessful plan we are now pursuing is about as follows:

(*a*) Allowing the enemy to concentrate his efforts exclusively against wholly inadequately protected shipping (our necessary lines of communication) in a zone through which our supplies now pass and must continue to pass.

(*b*) Maintaining a relatively large number of our available antisubmarine forces on the great stretch of American coast lines which lie over 3,000 miles away in areas in which the enemy not only is not operating, but can not profitably operate.

The enemy is perfectly content to have us protect our great stretch of unattacked coast lines as long as he will never have to, and in fact could not afford to, approach these distant lines in order to defeat us.

Mr. Lloyd George was perfectly right in saving that what we needed was ships, ships, ships, and more ships, but he didn't explain that those ships needed are of two kinds, namely:

First. Ships to oppose the enemy's war vessels.

Second. Ships to carry the supplies we must have.

The necessity for both in adequate numbers is vital, but either one alone is unavailing.

The fact must be thoroughly realized that the war is being, and must continue to be, fought exclusively on this side of the Atlantic, and that it will be won by us, or lost, within the next few months.

It can not be won by any accumulation of naval forces on our coast lines or in any other areas except those in which the war is being fought, and must continue to be fought.

It must be lost, or very unsatisfactory terminated, if there is not an immediate and sufficient accumulation of antisubmarine forces here in the ctitical areas. This for the simple reason that, if the shipping losses continue at the present rate—the Allies can not win.

I feel that I would fail in my duty if I did not continue to keep you informed of the situation.

SIMS.

Practically the same information as was given the ambassador in this letter was transmitted to the department in two cables of June 28, and in the further cable of June 29, which are as follows:

Sent June 28, 1917:

To Secretary of Navy, through Admiralty.

Protection of all allied shipping in time—I repeat in time—is present mission. Whatever efforts we can exert must be put into operation at once if they are to be effective. Reliable submarines would be of great use to strengthen British submarine patrols and also as scouts ahead of convoys. All submarines we send to Irish Coast in time will therefore be invaluable in insuring success of convoy system and hence success of war, provided these submarines are supplied from America and based upon their own mother ships.

SIMS.

Sent June 28, 1917:

To Secretary of the Navy, through Admiralty, from Queenstown.

I submit that if submarine campaign is to be defeated it must be by offensive measures. The enemy submarine mission must be destruction of shipping and avoidance of antisubmarine craft.

Concerning department's reference to a scheme for protection of merchant shipping which will not interfere with present escort duties, I submit that the time element

Digitized by Google

alone prevents utilization of any new antisubmarine invention. The campaign may easily be lost before any such schemes can come into effective operation. The enemy is certainly counting on maximum effort being exerted before long nights and bad weather of autumn, that is in the next three months. Heaviest effort may be anticipated in July and August. I again submit that the protection of our coast lines and of allies shipping must necessarily be carried out in field of enemy activity if it is to be effective. The mission of the Allies must be to force submarines to give battle. Hence no operations in home waters should take precedence over or be allowed to diminish the maximum effort we can exert in area in which enemy is operating, and must continue to operate in order to succeed.

SIMS.

Sent June 29, 1917:

To Secretary of Navy, through Admiralty.

No. 54. The situation is now not only critical but dangerous. I now recommend sending immediately in addition to all destroyers, yachts, and tugs, also gunboats of *Denver* and *Paducah* and *Austria* and similar classes. The necessity is to force the submarine to fight and divert it from shipping if Allies main forces, naval and military, are to be preserved for action.

SIMS.

The CHAIRMAN. Admiral Sims, it is about 5 minutes of 12 o'clock. I suggest, if you will, that we suspend here until to-morrow.

Admiral SIMS. Yes.

The CHAIRMAN. The committee will stand adjourned until 10 o'clock to-morrow.

Thereupon, at 11.56 a. m., the subcommittee adjourned until to-morrow, Thursday, March 11, 1920, at 10 o'clock a. m.

NAVAL INVESTIGATION.

THURSDAY, MARCH 11, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, and Trammell.

The CHAIRMAN. the committee will come to order. Admiral Sims, will you proceed.

STATEMENT OF ADMIRAL WILLIAM S. SIMS—Resumed.

Admiral SIMS. At the close of my testimony yesterday I had been considering the seriousness of the situation on the other side, and I had just read a letter which I thought necessary to submit to the American ambassador in London so that he could transmit it to the Government.

In connection with a number of cablegrams which have been submitted, you may have noticed that some of those were sent via the Admiralty in London. I think it might be well to explain that the reason of that was that because at that time we did not have any secret code in which we had confidence, we had codes in operations that had been in operation for many years and codes that were not as well constructed as they should be, and pending the formulation of proper codes we sent a number of cablegrams through the Admiralty, but with our own key so that they were just as secret.

Continuing my testimony, there was one cable of June 28, 1917, to the Secretary of the Navy, which I had not read at the close of the session of yesterday. It is as follows:

To: Secretary of the Navy.
(Through Admiralty.)
From: Queenstown.
Sent: June 28, 1917.
Admiralty for Secretary Navy, Washington, providing it meets Admiralty's full approval.
From: Admiral Sims.

Referring to department's opinion reported in last two cables to the effect that adequate armament and trained crews constitute one of the most effective defensive antisubmarine measures I again submit with all possible stress the following based on extended war experience. The measures demanded, if enemy defeat in time is to be assured, not defensive but offensive defensive. The merchantmen's inherent weakness is lack of speed and protection. Guns are no defense against torpedo attack without warning, which is necessarily the enemy method of attack against armed ships. In this area alone during the last six weeks 30 armed ships were sunk by torpedoes without submarine being seen, although three of them were escorted each by a single destroyer. The result would of course have been the same no matter how many guns these ships carried or what their caliber. Three mystery ships heavily manned

Digitized by Google

by expert naval crews with much previous experience with submarine attack have recently been torpedoed without warning. Another case within the month of mystery ship engaging submarine with gunfire at 6,000 yards, but submarine submerged and approached unseen and torpedoed ship at close range. The ineffectiveness of heavy batteries against submarine attack is conclusively shown by Admiralty's practice always sending destroyers to escort their men-of-war. The comparative immunity of the relatively small number of American ships, especially liners, is believed here to be due to the enemy's hopes that the pacifist movement will succeed. Cases are on record of submarines making successful gun attacks from advantageous sun position against armed ships without ship being able to see submarine.

I submit that if submarine campaign is to be defeated it must be by offensive measures. The enemy submarine mission must be destruction of shipping and avoidance of antisubmarine craft. Enemy submarines are now using for their final approach an auxiliary periscope less than 2 inches in diameter. This information just acquired. All of the experience in this submarine campaign to date demonstrates that it would be a seriously dangerous misapprehension to base our action on the assumption that any armament on merchantmen is any protection against submarines which are willing to use their torpedoes. The British have now definitely decided the adoption to the maximum practicable extent convoys from 16 to 20 ships. This is an offensive measure against submarines as the latter will be subject to the attack of our antisubmarine craft whenever they come within torpedoing distance of convoyed merchantmen. Moreover, it permits of concentrated attack by our forces and obliges the enemy to disperse his forces to cover the various routes of approach.

Concerning department's reference to a scheme for protection of merchant shipping which will not interfere with present escort duties, I submit that the time element alone prevents utilization of any new antisubmarine invention. The campaign may easily be lost before any such schemes can come into effective operation. The enemy is certainly counting on maximum effort being exerted before long nights and bad weather of autumn, that is in next three months. Heaviest effort may be anticipated in July and August. I again submit that protection of our coast lines and of allied shipping must necessarily be carried out in field of enemy activity if it is to be effective. The mission of the Allies must be to force submarines to give battle. Hence no operations in home waters should take precedence over or be allowed to diminish the maximum effort we can exert in area in which enemy is operating, and must continue to operate in order to succeed.

SIMS.

Similar cables to those just read were sent on June 30, July 1, and July 2. The following message was then received from the department. Only that part of the message dealing with the sending of reenforcements is here quoted:

Cablegram May 1.
From: Secretary of Navy.
To: Alusna, London.
For: Vice Admiral Sims. No. 44.
Received: July 2, 1917.

With reference to your previous cables, the Navy Department is fully aware of the urgency of sending all possible antisubmarine craft to European waters, and is doing its utmost to meet demands. Five destroyers will sail about the 1st of August from Asiatic waters, whence they have been ordered to duty in European waters. The Navy Department will assign seven cruisers for convoy duty in accordance with Admiralty's request.

There is little to comment on this message. I still was unable to believe that the department could possibly be aware of the urgency of the situation and still take no more action than was taken. The fact that five old destroyers would start a long cruise from the Asiatic station about a month hence was little satisfaction. As will be brought out later, the statement that seven cruisers would be assigned to convoy duty was the first intimation of cooperation in this work, the necessity of which had been impressed upon the department for more than two months previously. In fact, the convoy system had been in operation at this time for over a month, to the extent that British cruisers were available.

Digitized by Google

I therefore again pointed out in a message of July 3 that any character of light craft would be suitable for antisubmarine work, and that the primary consideration was that of time. [Reading:]

From: Vice Admiral Sims.
To: Secretary of the Navy.
Through: Admiralty.
Sent: July 3, 1917.

No. 73. Your No. 44. If enemy submarine pressure anticipated in July, August, and September is to be thwarted, the necessity for additional craft immediately is imperative. The additional craft are needed not only for actual offensive duty but to insure safety of troop and other convoys. Can not all destroyers Atlantic coast be sent and all revenue cutters? Are there no armed tugs available? Even the small number of fleet tugs would help. I fully realize the pressure on department to allocate forces to France, Mediterranean, and other localities, but am particularly anxious that such effort as we can exert should have maximum effect in meeting the general allied situation. The ocean approach routes to channel and Irish Sea are critical areas, and with *Dixie* at Beregaven and *Melville* at Queenstown and our personnel in that locality thoroughly familiar with situation, methods of operation, and administration, and all using same codes and methods of communication, it will be conducive to maximum efficiency and effectiveness of new forces joining to concentrate them in same area, keeping all United States forces together.

SIMS.

Many more messages could be quoted among those which were sent in July and August, dealing with the same subject in almost tne same terms, but it is believed that it would be merely unnecessarily taking up the time of the committee to read them.

A message received from the Navy Department, on July 5, indicated that they were at last beginning to perceive that there was a war being fought in European waters. This message of July 5 was as follows:

[Cablegram.]

From: Navy Department.
Via: Commodore Gaunt.
For: Vice Admiral Sims.
Received: July 5, 1917.

Eight patrol boats under Capt. Fletcher due to arrive French coast 5th July. Ten more yachts will sail about 15th July to join them. Five coal-burning destroyers, *Preston* type, will sail in short time to base temporarily on Azores. Seven vessels, *Denver* class, detailed to assist British merchant convoy operations from this side. Notice will be given as far in advance as possible of dates of departure of troop ships and convoy. Twelve trawlers and one yacht under Capt. Magruder will leave for European waters about 10th August. Department is strongly impressed with the necessity for adequate antisubmarine patrol in and off entrance to Gibraltar. Ten vessels, *Birmingham*, *Chester*, *Salem*, *Sacramento*, *Yankton*, *Machias*, *Castine*, *Paducah*, *Wheeling*, *Marietta*, are available to send across if considered that they can be of value. Could they perform sufficiently valuable service to warrant sending over? Where would they base? What duty would they perform? Would they require coal from this side? Department is prepared to supply two or four 14-inch guns similar to those on *New York* as per Admiralty's request. Guns can be delivered ZT slides at once. So far no intimation as to any definite plans for future operations of naval forces. In view of requests made and our efforts to respond must insist that any plans operation under consideration be submitted for our study.

As has been observed, the letter sent to the Secretary contained the plan that was proposed for the suppression of the submarine campaign, and it remained the same throughout the war, so that the statement that is made in this telegram that they do not know what the plans are, is, to say the least, extraordinary.

Five days after this message was received, on July 10, 1917, the Secretary of the Navy sent me in a cable dispatch the first full state-

Digitized by Google

ment of the Navy Department policy which had been received. This message was as follows:

From: Secretary of Navy.
To: Vice Admiral Sims, U. S. S. *Melville.*
Received: July 10, 1917.

The following letter from the Secretary to the Secretary of State is quoted for your information and guidance as an index of the policy of the department in relation to cooperation of our naval forces with those of our allies: "After careful consideration of the present naval situation, taken in connection with possible future situations which might arise, the Navy Department is prepared to announce as its policy, in so far as it relates to the Allies: First, the most hearty cooperation with the Allies to meet the present submarine situation in European or other waters compatible with an adequate defense of our own home waters. Second, the most hearty cooperation with the Allies to meet any future situation arising during the present war. Third, the realization that while a successful termination of the present war must always be the first allied aim and will probably result in diminished tension throughout the world, the future position of the United States must in no way be jeopardized by any disintegration of our main fighting fleet. Fourth, the conception that the present main military role of the United States naval force lies in its safeguarding the line of communications of the Allies.

In pursuing this aim there will be generally speaking two classes of vessels engaged, minor craft and major craft, and two rôles of action, first offensive and second defensive. Fifth, in pursuing the rôle set forth in paragraph 4 the department can not too strongly insist that in its opinion the offensive must always be the dominant note in any general plans of strategy prepared. But as the primary rôle in all offensive preparations must perforce belong to the allied powers, the Navy Department announces as its policy that in general it is willing to accept any joint plan of action of the Allies deemed necessary to meet immediate need. Sixth, pursuant to the above general policy, the Navy Department announces as its general plan of action, the following: "One, its willingness to send its minor fighting forces, composed of destroyers, cruisers, submarine chasers, auxiliaries in any number not incompatible with home needs, and to any field of action deemed expedient by the joint allied admiralties which would not involve a violation of our present State policy. Two, its unwillingness as a matter of policy to separate any division from the main fleet for service abroad although it is willing to send the entire battleship fleet abroad to act as a united, but cooperating unit when after joint consultations of all admiralties concerned the emergency is deemed to warrant it and the extra tension imposed upon the line of communications due to the increase of fighting ships in European waters will stand the strain imposed upon it. Three, its willingness to discuss more fully plans for joint operations."

JOSEPHUS DANIELS.

I will discuss this message more fully later, and then will read my reply when the general question of policy is taken up. I wish here merely to state that the policy, as herein stated, is only to be judged by actual results in carrying it out and they speak for themselves. I particularly wish to stress the point that this first definite statement of policy was received on July 10, a few days over three months after we had declared war, as stated in my original letter of January 7. The astounding features of this policy, however, were that, while it stated our intention to cooperate to the fullest degree, still such cooperation was conditioned upon, first, an adequate defense of our own waters; and, second, the future position of the United States after this war was finished. I am wholly unable to conceive of any war policy, particularly in a world war of this nature, which was certain to exhaust all participants, with the possible exception of ourselves, being based upon the requirements of any possible future war.

As an illustration of the fact that the department was kept fully informed at all times of the progress of the submarine war, I will read you one cable, that of July 5, which is typical of the continuous

Digitized by Google

flow of messages which were sent with regard to the actual operations of submarines and the losses of merchant ships.

Sent: July 5, 1917.
To: Secretary of the Navy.
Through: Admiralty.
No. 81.

Total losses British, allied, and neutral week ending July, 128,500 tons. Apparently 16 large submarines have been out, but so far impossible to draw conclusions as to reasons for diminished activity. Isolated cases are reported of ships attacked longitude 29° and 26°. Submarine mine layers not very active. Seventy-seven mines have been picked up, which is way below weekly average. Fifteen reports of encounters with enemy submarines in British waters, two by destroyers, three by special-service ships, one by submarine, four by auxiliary patrol, one by seaplain, four by merchant vessels.

SIMS.

It is my recollection that a similar telegram was sent every day.

Thus far I have quoted only from my cables to the Navy Department, with the exception of the first letter of April 19, which I read, in order to show completely the situation was covered from the very beginning. Because of the delays inevitable in letter correspondence, all important matters had been dealt with through the medium of cable dispatches, during these first critical months. My letters to the department were, therefore, only confirmatory. As a letter can, however, often give a better general résumé of the whole situation than a cable, I propose now to read you parts of some of my letters sent during this same period to the department.

As I said before, if after the conclusion of my testimony the committee would like to have complete copies of all the records that I refer to here by their paragraphs, I will be prepared to give them to them.

In a personal letter to the Secretary of the Navy, on the 8th of May, for example, I gave an account of the conferences held during my visit to Paris in the first week of that month. I will quote only one or two of the paragraphs, the remainder being merely an elaboration of messages already read:

MAY 8, 1917.

MY DEAR MR. SECRETARY: Ever since I arrived here I have been wanting to write you personally concerning certain details of my duties on this mission, but, as I am sure you will understand, I have been most strenuously occupied, both in my military duties and with the unavoidable official functions, which are, however, of importance as a means of getting in contact with those who have access to various lines of information.

In view of the critical condition created by the submarine campaign, I have, as you directed, used the cable liberally, and I have taken pains that these cables give as clear idea of the situation as possible, I believe there is little to add to them.

Twice within a short period the prime minister has visited Paris, the last time from May 3 to May 6. He was accompanied by Lord Robert Cecil, Field Marshal Robertson, the first sea lord of the Admiralty, Admiral Jellicoe, and many other officials.

There can be no doubt that there is a great anxiety as to the final outcome of the war. This anxiety is caused by the present success of the German submarine campaign. If that could be put down or diminished, all other difficulties without exception, could be met.

This, I believe, can be done only by an increase in the number of vessels operating against the submarines. Great Britain is turning out destroyers and antisubmarine craft to their maximum capacity, and also building 1,000 bomb-throwing guns and other appliances, but these will take some time to complete.

You will, I am sure, be pleased to know that my visit to Paris was very successful, as it resulted in a complete agreement between the French and British Navy Depart-

Digitized by Google

ment as to the manner in which our destroyers and other forces should be employed in the campaign against the enemy. Our force and its supply train should act as a unit in the area of the greatest activity of the submarines.

Very sincerely, yours, ——— ———.

Hon. JOSEPHUS DANIELS,
Secretary of the Navy, Navy Department, Washington, D. C.

In my letter of April 27 I had pointed out:

The military situation almost daily grows more critical, as is indicated by my cabled reports of merchant tonnage lost. The critical area continues to the southward and westward of Ireland.

Similarly, there are certain paragraphs in my letter of May 11 of interest in this connection:

12. I have considered it vitally important, and in this decision am in complete agreement with both the French and British Admiralties that our destroyer forces should not only remain concentrated and operate together but, what is more important, that they should remain essentially mobile. The destroyer is by far the greatest enemy of the submarine; and I am particularly anxious that our forces should be used to the greatest possible effect in assisting in putting down the enemy submarine campaign. I am prompted in this decision not only because it is manifestly the most effective assistance which we can render at this time to the common cause, but also the secondary reason that such a course is certain to be productive of the greatest distinction for the United States naval service.

It is therefore my aim, as reported to the department, to keep our forces, to the extreme possible degree, independent of any shore station, in order that the entire force with its mobile base can be moved at will and follow the center of enemy submarine pressure.

13. As reported by cable dispatch, the situation remains critical, owing primarily to the enemy submarine campaign. The question at issue is, and must remain, the control of our lines of communication. It is of course true that the primary naval mission should always be the destruction of the enemy's fleet, but this must not blind us to the fact that its destructions may often not be an effective form of pressure in itself, but merely a means to an end.

The only apparent solution to the submarine issue lies in numbers of antisubmarine craft with a view to sufficiently dispersing the enemy submarine effort so that shipping losses will be reduced below the critical point.

And again I said:

29. It is in view of the above and of the large amount of supporting evidence obtained that I have so urgently recommended that our primary military effort should be concentrated in getting the maximum number of antisubmarine craft of all description into the enemy's main area of activity.

In my general reports of June 1 and 15, I again especially emphasized the importance of immediate full cooperation with the Allies in meeting the submarine menace. I will read you those paragraphs of interest in this connection. [Reading:]

It is gratifying to be able to report that the operations of our forces in these waters have proved not only very satisfactory but also of marked value to the Allies in overcoming the submarine menace. The equipment and construction of our ships has proved adequate and efficient, and the personnel has shown an unusually high degree of enthusiasm and ability to cope with the situation presented. It is hoped that the destroyer force operating in these waters can be greatly increased in the near future, as this will unquestionably prove to be the most effective assistance which we can afford to the allied cause at the present time. As previously reported, it is considered of the utmost importance to the success of the operations of our forces that they remain concentrated. The material difficulties and resulting interference with efficient operations which would be involved if they were concentrated beyond reach of their own floating bases would seriously impair their military efficiency.

During three years of war the other allies have gradually established advanced bases suited to their requirements, and hence they are in a better position to operate over widely dispersed areas. By keeping our forces concentrated with a view to their being self-sustaining to the maximum degree, they will not only be able to render the greatest possible assistance to the allied cause, but also the future distinction accruing to our service of such special work as they may perform will be better assured. Our

Digitized by Google

forces based on Queenstown continue operations as previously reported. Their program has now been changed to five days out and three days in, which will result in better care of the machinery, and hence greater reliability of service.

A considerable share of the time on duty is now spent in escorting the most valuable ships through the danger zone. Prior to the arrival of our forces, it was impracticable to meet the demands of the offensive campaign against submarines, and also to escort all valuable cargoes. The larger the force, the more the valuable cargoes which can be escorted.

As far as possible the escorting is done in relays, as previously reported, thereby not leaving any areas without patrol craft. Valuable cargoes are escorted by a single destroyer, but especially valuable ones require two and sometimes three escorts, and it is apparent that it is very difficult to handle such escorting duty and maintain any prearranged program of patrol.

My letter reports of June 8, 15, and 20, I will be found to contain almost similar paragraphs, with the exception of their possibly being more forcibly worded. I believe it to be unnecessary to read them at this time, as they are a repetition of the dispatches or letters already read you.

In a letter of June 29, however, I made a complete review of the situation at that time, with the Allies rapidly losing the war. It shows also the urgency with which I was recommending the concentration of our forces in the war zone. I will therefore read this letter in full:

LONDON, *June 29, 1917.*

From: Commander United States naval forces operating in European waters.
To: Secretary of the Navy (Operations).
Subject: General report concerning military situation.

I feel that there is little to add to my recent cable despatches which, in view of the importance of the time element, have been made full and detailed.

2. To sum up my dispatches briefly, I would repeat that I consider that the military situation is very grave indeed on account of the success of the enemy submarine campaign.

If the shipping losses continue as they have during the past four months, it is submitted that the Allies will be forced to dire straits indeed, if they will not actually be forced into an unsatisfactory peace.

The present rate of destruction is very much greater than the rate of building, and the shortage of tonnage is already so great that the efficiency of the naval forces is already reduced by lack of oil. Orders have just been given to use three-fifths speed, except in cases of emergency. This simply means that the enemy is winning the war.

3. My reasons for being so insistent in my cable despatches have been because of my conviction that measures of cooperation which we may take will be inefficient if they are not put into operation immediately—that is, within a month.

There is every reason to believe that the maximum enemy submarine effort will occur between now and the 1st of November (1917), reaching its height probably during the latter part of July, if not earlier.

4. There is certainly no sovereign solution for the submarine menace except through well-established methods of warfare based upon fundamental military principles.

5. It is submitted that the cardinal military principle of concentration of effort is at present being pursued by the enemy and not by the Allies.

6. We are dispersing our forces while the enemy is concentrating his. The enemy's submarine mission is and must continue to be the destruction of merchant shipping. The limitations of submarines and the distances over which they must operate prevent them from attacking our naval forces, that is, antisubmarine craft. They can not afford to engage antisubmarine craft with guns; they must use torpedoes. If they should do so to any considerable extent their limited supply would greatly reduce their period of operation away from base and the number of merchantmen they could destroy. Their object is to avoid contact with antisubmarine craft. This they can almost always do, as the submarine can see the surface craft at many times the distance the surface craft can see a periscope, particularly one less than two inches in diameter.

Moreover, the submarine greatly fears the antisubmarine craft because of the great danger of the depth charges. Our tactics should therefore be such as to force the submarine to incur this danger in order to get within range of merchantmen.

Digitized by Google

7. It therefore seems to go without question that the only course for us to pursue is to revert to the ancient practice of convoy. This will be purely an offensive measure because if we concentrate our shipping into convoys and protect it with our naval forces we will thereby force the enemy in order to carry out his mission to encounter naval forces, which are not embarrassed with valuable cargoes, and which are a great danger to the submarine. At present our naval forces are wearing down their personnel and material in an attempted combination of escorting single ships, when they can be picked up, and also of attempting to seek and offensively engage an enemy whose object is to avoid such encounters.

With the convoy system the conditions will be reversed. Although the enemy may easily know when our convoys sail, he can never know the course they will pursue or the route of approach to their destinations. Our escorting forces will thus be able to work on a deliberate, prearranged plan, preserving their oil supplies and energy, while the enemy will be forced to disperse his forces and seek us. In a word, the handicap we now labor under will be shifted to the enemy; we will have adopted the essential principle of concentration while the enemy will lose it.

8. The most careful and thorough study of the convoy system made by the British Admiralty shows clearly that while we may have some losses under this system, owing to lack of adequate number of antisubmarine craft, they nevertheless will not be critical as they are at present.

9. I again submit that if the Allied campaign is to be viewed as a whole, there is no necessity for any high-sea protection on our own coast. The submarine as a type of war vessel possesses no unusual characteristics different than those of other naval craft, with the single exception of its ability to submerge for a limited time. The difficulty of maintaining distant bases is the same for the submarine as it is for other craft. As long as we maintain control of the sea as far as surface craft are concerned, there can be no fear of the enemy establishing submarine bases in the Western Hemisphere.

10. To take an extreme illustration, if the enemy could be led or forced into diverting part of his submarine effort to the United States coast, or to any other area distant from the critical area surrounding the coast of France and the United Kingdom, the antisubmarine campaign would at once be won. The enemy labors under severe difficulties in carrying out his campaign even in this restricted area, owing to the material limitations and the distances they must operate from their bases, through extremely dangerous localities. The extent of the United States coast line and the distances between its principal commercial ports, preclude the possibility of any submarine effort in that part of the world except limited operations of diversion designed to affect public opinion, and thereby hold our forces from the vital field of action.

11. The difficulties confronting the convoy system are, of course, considerable. They are primarily involved in the widely dispersed ports of origin of merchant shipping; the difficulty of communication by cable; the time involved by communications by mail; and the difficulties of obtaining a cooperation and coordination between Allied Governments.

As reported by cable dispatch, the British Government has definitely reached the decision to put the convoy system into operation as far as its ability goes. Convoys from Hampton Roads, Canada, Mediterranean, and Scandinavian countries are already in operation. Convoys from New York will be put in operation as soon as ships are available. The British Navy is already strained beyond its capacity, and I therefore urgently recommend that we cooperate at least to the extent of handling convoys from New York.

12. The dangers to convoys from high-sea raiders is remote, but, of course, must be provided against, and hence the necessity for escorting cruisers or reserve battleships. The necessity is even greater, however, for antisubmarine craft in the submarine war zone.

13. As stated in my dispatches, the arming of merchantmen is not a solution of the submarine menace, it serves the single purpose of forcing the submarine to use torpedoes instead of guns and bombs. The facts that men-of-war can not proceed safely at sea without escort, and that in the Queenstown avenue of approach alone in the past six weeks there have been 30 armed merchantmen sunk, without having seen the submarines at all before the attack, seems to be conclusive evidence. A great mass of other evidence and war experience could be collected in support of the above.

14. The week ending June 19 has been one of great submarine activity. Evidence indicates that 15 to 19 of the largest and latest submarines have been operating, of which 10 to 13 were operating in the critical area to the west and southwest of the British Isles. The above numbers are exclusive of the smaller and earlier type of submarines and submarines carrying mines alone. Two submarines are working to

Digitized by Google

the westward of the Straits of Gibralter. A feature of the week was the sinking of ships as far west as 19°. Three merchant ship convoys are enroute from Hampton Roads the last one, consisting of 18 ships, having sailed on the 19th of June. One hundred and sixteen moored mines have been swept up during the week.

Twenty-two reports of encounters with enemy submarines in waters surrounding the United Kingsdom have been reported during the week—three by destroyers, two by cruisers, two by mystery ships, one by French gunboat, three by submarines, nine by auxiliary patrol vessels, one by sea plane and one by merchant vessel.

There is attached copy of report of operations by antisubmarinecraft based on Queenstown.

WM. S. SIMS.

That is just a sample of similar letters that were sent in.

All of my letter reports, throughout the rest of the war, continued to give, week by week, a full statement of the military situation, and of the progress of the campaign against submarines; these but would add but little to the points already emphasized. I, therefore, propose to read passages from only one or two more letters, dealing with specific phases of the situation.

My letter of July 7 emphasized the fact that the war was being lost:

Letter No. 18, July 7, 1917:

I can add little to my cable dispatches concerning the general military situation. Briefly stated, I consider that at the present moment we are losing the war. This is due to the success of the enemy submarine campaign, the demands which it places upon our available Allied forces in the protection of essential lines of communication and the wholly inadequate number of forces of all descriptions both to meet the submarine menace and at the same time to insure readiness for any other unsuspected developments.

I submit that if we are to fulfill our obligation to the allied cause, we should sacrifice every other interest to placing in the critical areas, the maximum number of ships which can possibly be assembled.

At the end of July I attended a conference of the heads of the Allied navies, held in Paris, at the time of the meeting of the Supreme War Council of the Allies, attended by the premiers of the Allied countries by the and heads of their respective armies. My report of these conferences brings out some significant features of the extent of the cooperation which was then not being given by the United States to the Allied cause as a whole.

Letter No. 52:

JULY 30, 1917.

From: Vice Admiral Sims.
To: Chief of Naval Operations.
Subject: Naval and military conferences at Paris, July 24 to 27.

At the request of the French and British Admiralties, I attended certain naval and military conferences in Paris between July 24 and 27.

The naval conferences consisted in general discussion and exchange of information concerning the prosecution of the allied antisubmarine campaign.

There were present at these conferences, the French minister of marine, the French chief of naval staff, and other leading officials of the French Admiralty; Admiral Jellicoe with staff, representing the British Admiralty; an Italian admiral with staff, who is both the commander in chief afloat and the chief of the Italian naval staff. Japan was represented by the Japanese naval attaché, Paris.

The first question before the naval conference was a revision of the agreements made sometime ago at a conference held at Corfu. At that conference it was decided that each Nation should be assigned certain zones in the Mediterranean, the senior allied officer commanding in each zone.

The nature of the enemy campaign has shown the necessity for a more central allied organization, and hence the proposal at this conference was made by the French minister of marine that all antisubmarine operations should be put under the general command of the British vice admiral commanding at Malta. The plan was intended in no wise to interfere with the various allied commands, particularly of

Digitized by Google

heavy forces. The proposal submitted was merely that one officer should take general charge of the antisubmarine operations and that all other allied flag officers in the Mediterranean should cooperate with him and furnish him all assistance possible. The area under discussion did not include Gibraltar, which is under a British admiral who commands the waters in that neighborhood.

This suggestion of the French minister of marine received unanimous approval.

As both France and England felt that the forces of Italy available for antisubmarine work were not being employed to the best advantage, this point was then taken up for discussion. That is, particularly as to whether Italy could not allocate more forces to antisubmarine work.

It was recognized that all submarines operating in the Mediterranean now base on Pola or Cattaro at the head of the Adriatic, and that hence every effort should be put forth toward preventing their egress from, and ingress into, that sea. England has over 100 drifters operating at the mouth of the Adriatic attempting to maintain what might be called a mobile barrage. That is, they constantly patrol across the Otranto Straits using their nets for the purpose of intercepting submarines. That the work of these drifters is of concern to the enemy has been proven by the raids made upon them by Austrian cruiser forces. The primary demand is therefore for destroyers and similar craft to protect the drifter service.

All French destroyers in the Mediterranean which can possibly be spared from vital escort duty are entirely available for duty with the Otranto barrage.

The demand for British destroyers in the North Sea and on the approach trade routes to France and the United Kingdom was so great that it is impossible to assign any British destroyers to Adriatic duty in spite of the fact that British as well as French lines of communication in the Mediterranean are constantly harassed by enemy submarines operating from the Adriatic.

Out of 100 British destroyers, which is the maximum number which can be considered as available for the British Grand Fleet in case of a general action, 55 are on constant patrol duty in the North Sea, an average of 15 are at all times under repairs, leaving but 30 in what might be called a constant state of readiness with the Grand Fleet, though some of these on patrol duty could join the fleet before an action took place, though not with full supply of fuel oil.

Against this number the German High Sea Fleet probably has not less than 140 destroyers available for a high sea action. It has been necessary in the last few days to withdraw destroyers from the Grand Fleet to protect new mine barrages created near Ostend and Zeebrugge for the purpose of protecting the monitors and other naval forces which are assisting in the general combined military and naval attack on the above mentioned German bases.

A general discussion occurred as to a permanent material barrage to be attempted across the Straits of Otranto but it was unanimously agreed that such a barrage would be wholly ineffective if it could not be adequately protected by surface craft.

The Italian admiral stated definitely that he could not allocate any destroyers for this service on account of the danger of a high sea action between the Austrian and Italian fleets. For this reason he dared not risk a single destroyer, and furthermore must keep them in the highest state of readiness at all times for fleet action. He said he realized fully the pressing need for antisubmarine operations, but that he was forced to view the other considerations as paramount.

In the general discussion it developed, and in fact the Italian admiral admitted, that he was prompted in his naval policy primarily by the political pressure which is constantly brought to bear upon him in his own country. The fact was pressed upon him that destroyers on duty in protecting the barrage would be in no sense immobilized for duty in case of an action with the Austrian fleet, and this for the simple reason that they would be at all times between the enemy and their own fleet. It was also pointed out that the Italian admiral in his discussion had not taken into consideration the French destroyers who were always available for any combined fleet action.

As stated above, however, it was apparent that the principal consideration governing the Italian admiral's statement was the political pressure under which he must operate.

The effect of raids on the eastern Italian coast, and the effect on public opinion in case even a single vessel should be lost, were considerations, which, to him, in view of the conditions existing in his country were paramount.

It was finally agreed, however, that the British admiral from Malta—who was present at this conference—would, after consultation with the French admiral in the Mediterranean and other allied flag officers afloat in that area, proceed to Italy and attempt to reach an agreement as to the employment of such forces as were available.

Digitized by Google

The Italian admiral suggested the desirability of an offensive against the Austrian bases, particularly Catarro. He agreed that the waters in that region were too deep for mining and that the relative strength of heavy forces available with those of the enemy were not sufficient to warrant sacrifices in a purely naval attack upon land fortifications. He stated that he thought the attack would be primarily in the air. This question, of course, depends entirely upon the number of available aircraft, which are wholly inadequate.

Italy stated that she intended to make attacks on Catarro from the air, but it is apparent that the number of craft available will never result in effective success.

The Italian point of view seems to be one of considering her own forces solely and not of considering the other allied forces available, particularly the fact, for instance, that the British drifter squadron is, in effect, an allied scouting force for the Italian fleet.

The question of a fixed material barrage across the Straits of Otranto depends entirely upon the availability and transport of material. Even if the material were available it was estimated that it would take at least 40 weeks to transport it to Italy from England by rail.

The Italian admiral also showed an inclination to view destroyers as a type of craft which must be constantly husbanded. They could not be considered as effective weapons unless they were kept constantly under overhaul and repair. I called attention to the fact that while this was to a certain extent a view held before the war, still that the developments of the war had shown the view to be unsound.

I pointed out the duty being performed by American destroyers (which was taken up immediately after the cruise across the Atlantic) and stated that in spite of their constant and strenuous duty at sea, I nevertheless considered them available at any time for the duty for which they were primarily created; that is, offensive duty in connection with high sea action.

In this connection I may state that barring the expression of professional opinion such as that just indicated, I took no part in the discussion of the political or military relations governing the operations of the various antisubmarine forces in the Mediterranean.

It was impossible to obtain any promises at all from the Italian admiral concerning the use of his destroyers for other than holding them in reserve in case of a high fleet action, and it was apparent, as stated above, that the primary consideration governing his opinions were of a domestic-political nature.

In connection with the above it was brought out in the conference that 14 Italian destroyers remained at anchor at Brindisi for extended periods during the month of July.

As stated above, the only definite decision reached by the conference was that the British admiral at Malta would take over the direction of the anitsubmarine operations in the Mediterranean subject to general approval of, and coordination with, the French commander in chief in those waters.

It was brought out that the relative allied situation as regards destroyers in the Adriatic or in waters immediately adjacent thereto is 34 Italian, 10 French, and 22 Austrians. As compared with this situation, in case of unexpected high sea action in the North Sea, England could probably not count upon more than 50 destroyers against about 140 German destroyers. England has already sent to Italy two monitors, three submarines, and a large quantity of aviation material.

A general discussion followed concerning various questions in connection with the antisubmarine campaign. The first point considered was the problem presented by the use by the enemy of large type submarines of the nature of the *Deutschland* class carrying two 5.9-inch guns and a large number of torpedoes—perhaps 30. It is understood that a number of this class are under construction and that four will be ready for sea toward the last of this year. As reported to the department, one vessel, something of this type has been operating in the general vicinity of the Azores for some time, using captured neutral or other merchant vessels as a floating base. It is believed that the only answer to such a move on the part of the enemy (which could not be an extensive one for sometime) is the convoy system of escorting each convoy by a cruiser which would prevent the above type of submarine from using their guns, and hence force them to a restricted role with torpedoes only.

The available destroyers of the allied powers are wholly insufficient to attempt any more extensive high sea escort work than that now, or soon to be, in operation. Even the extent to which this duty is being carried on now greatly restricts all contemplated strictly offensive plans. That is, against submarines themselves at, or near, their bases, and to the exclusion of immediate protection of trade.

Concerning this new type of submarine, we only need consider their operations outside of the areas which are now commonly termed the submarine zone, because within that zone the destroyer escorts will prove effective, providing the convoy system can be put into full operation.

Digitized by Google

The relatively small numbers of the new type and the large areas over which they must operate outside of the submarine zone, will greatly restrict the menace which they will present.

If shipping is concentrated in convoys, the routes of which, the submarine can determine only by scouting, it is believed that success on their part will occur only in isolated instances, and, in the presence of a cruiser (which will prevent the use of the submarine's guns) it is not believed that the losses they can inflict will be critical. For example, a submarine of this nature might be able to approach a convoy during daylight and fire two or three torpedoes, but the cruiser which would immediately proceed in that direction on a widely zigzagging course, would prevent succeeding attacks in the same arc of approach. At night fall, if the cruiser has thoroughly kept the submarine under in the direction of its approach and if the convoy makes a radical change of course for some hours, it is doubted whether a second torpedo attack could be carried out the same day or night.

England has sent a mystery ship and two submarines to the Azores, and it is hoped that the United States will also send two submarines and a mystery ship to this locality at least for the time being.

The advisability of the United States sending one of her older battleships with perhaps one or two small auxiliary craft to the Azores to prevent the use of those islands as a base during the coming winter should be considered. The needs of the situation in more vital areas however should be given full weight.

It is believed that no destroyers should be kept in the Azores as their operations are much more seriously needed closer to the European coast from whence they can be sent out for important escort duty.

England has at present four convoys every eight days across the Atlantic. In order to cover all trade it will require at least eight convoys each eight days, but this extension can not be realized for some time. There is no prospect in sight of ability to convoy outgoing ships.

It was stated that the Gulf of Helgoland is sufficiently mined to leave the submarines but two safe channels of access—that is, close to the shores principally in territorial waters. An attempt is being made to stop the ingress and egress of enemy submarines in these two channels with England submarines, but the numbers available are very inadequate.

The question of mining territorial waters is a very serious one involving all of the Allies, and is of such a nature that a decision must necessarily be based upon diplomatic and military as well as upon naval considerations. This subject has naturally been under consideration for some time, but I am not able to report anything definite as to its present status.

Considerable discussion occurred as to whether any nation had developed effective means other than the use of surface craft for protecting mine fields from sweeping operations. Nothing of an effective nature has been developed to date.

The question of mine fields which would be dangerous to submarines whilst submerged but safe for surface craft was discussed. No entirely satisfactory designs have been developed to date. England is attempting to modify some of her older mines so that they will be dangerous below a depth of 45 feet from the surface, but will disarm themselves in case they drag or in any other way rise above 45 feet in depth.

Both England and France are attempting to develop a design of mine of this nature. The French stated that they were manufacturing some small floating mines for use by merchant ships when being pursued by a submarine. They were designed to float for one hour and then sink.

The British have considered various designs of such mines, but none of a satisfactory type have been developed.

The use of kite balloons were discussed. The British have had some success by using these balloons with a small group of destroyers on the outgoing routes of the submarines. The use of kite balloons for merchant convoys was considered questionable, as they might attract submarines which otherwise would not sight the convoy. If kite balloons can be provided and handled by merchant convoys, their use is well worth serious consideration. It is probable that they will be tried.

The naval conference was requested to meet on one day with the military conference for a general discussion of the shipping situation, particularly as it affects the forces in the field.

I might say there that from time to time the prime ministers of the various countries got together for a discussion of the situation, and they always asked the military and naval people to get together also. Upon this occasion it was evident that there was not sufficient cooperation between the military and naval people, so that Gen. Foch

Digitized by Google

invited the allied naval council to meet with the allied ilmitary council in this discussion, and that is referred to in this letter. [Continuing reading:]

This combined conference was led by the French military chief of staff, Gen. Foch. It was apparent that the French are very much concerned as to the military support which they can count upon from the United States. Their urgent need of assistance is unquestionable. Their need of definite assurances, particularly as to the numbers and character of troops and their time of availability, is extremely desirable from a standpoint of morale if nothing else.

I might state here that I am not butting in at all into military affairs, but it came down later to a question of shipping, if our troops were to cooperate with the Allies. [Continuing reading:]

Aside from their desire for definite knowledge of military support, their principal concern seems to be as to whether there is full realization of the demands which will be placed on oversea lines of communication in maintaining over-seas military forces. They apparently have no doubt but that the United States is planning to support its troops in France, but there seems to be considerable concern as to whether the United States realizes the extent of the supply sustem which armies of today demand. They apparently feel that it is not only necessary for them to have definite knowledge of our troops movements, in order that their military plans may be governed accordingly, but also they seem to fear the demands which our troops may make upon our own resources will be over and above the supplies which will be sent from home.

I may state there that there are but few people, I think, who have any understanding of what it means to supply a million men, at a distance. It requires 50,000 tons of sea-borne freighting. [Continuing reading:]

They also seem to fear that the shipping which will be taken for the supply of our military forces may seriously affect, either directly or indirectly, the shipping which is necessary to maintain the allied forces. For example: Both British and French shipping necessarily works from the nearest ports and there is probably a large amount of material coming from the United States which has been brought by United States shipping from South America and other countries. There therefore seems to be concern over the possibility of our withdrawing a considerable amount of our shipping in the western hemisphere for troops and troop supply uses which will at once throw greater demands on British and French shipping.

As stated in my telegram of yesterday, the British Minister of Shipping appeared before the combined conference and made a general statement concerning the shipping situation from his standpoint. It was to be noted particularly that in all of his calculations he had necessarily not taken into account generally the assistance which the United States will probably render. This is on account of lack of definite information as to America's plans. He stated that a movement was on foot to withdraw about 80,000 skilled British workmen from the western front to increase the output of merchant shipping construction in England, and that if this was, done it was hoped that by November, 1918, England's construction program would commence to yield about 3,000,000 tons per year. He stated that until that time the present entirely essential needs of England, together with the present support which she is giving to the Allies, could probably be met. He stated clearly, however, that England could not exceed at all the support she is now giving the Allies and that his estimates would also involve considerably more privations in the United Kingdom than were now being experienced. His estimates also were dependent upon the supply of the necessary steel and other material. In other words, it is hoped that for the period extending to October, 1918 the continually diminishing

Digitized by Google

available tonnage will suffice for imperative needs, that is, providing the destruction of shipping does not increase above its present average rate of about 500,000 tons per month. At present, 585 ships, or over 1,200,000 tons of British shipping is allocated to supplying France exclusively, and also large amounts for the supply of Italy and other European allies.

It is apparent from the above that the situation can only be counted upon to begin to improve from November, 1918, and that there are many important considerations upon which depends the ability of the Allies to tide over the present critical shipping prospects.

It was also made very apparent that closer coordination of effort should be immediately established between the United States and the Allies. All military future plans are certainly largely dependent upon America's action. Although America's military support is urgently needed, it is nevertheless absolutely necessary that such support should not place any new demands upon the allied shipping situation considered alone. It is also very evident that the general campaign against the enemy, both military and what might be called a "shipping campaign," is really dependent upon America's support, and hence that the efficient prosecution of the war requires a closer coordination of effort between the United States and the European Allies than now exists. By this is meant that the Allied War Councils, both military and in other fields, should be supplied immediately, and should be kept supplied with more definite information of America's plans and intentions. All experience clearly shows that this can not be done by long distance communication. It can be done efficiently only by sending responsible representatives of the United States to Europe for consultation. It is also vitally important that all branches of war activity should be coordinated, and hence that such representatives as we send abroad should be formed into one organization. It is also considered important that such an organization after their first visit to Europe and their preliminary consultations should return to the United States preparatory to a further European visit in order that their information may be kept strictly up to date without depending entirely upon cabled communication.

It is for the above reasons that the combined naval and military conference were unanimous in hoping that the United States would be fully represented for both military and shipping questions at the approaching council to be held in London about August 10.

It never was held, by the way. [Continuing reading:]

In general it may be said that the conferences in Paris both naval and military fully confirmed the general tenor of all of the dispatches which I have sent concerning the general allied war situation. I was present at all of these conferences and nothing developed at any time which would warrant modification in any way of recommendations which I have previously made.

On that I think it right to say that there were no plans made for coordination, either in a military sense or in a shipping sense.

In my report of August 20, I pointed out that, while it was true that the war could not be won on the sea, it might very easily be lost thereon, and, in fact, up to this time, was being lost:

AUGUST 20, 1917.

The demands on the available destroyers are even now very difficult to meet. Precedence must, of course, continue to be given to troop ships and troop supply ships, but at the same time if the demand for destroyer escort for such shipping becomes so great as to jeopardize the safety of mercantile shipping which is essential to our Allies, a serious danger is thereby involved which may easily do more harm that if our troops actually remained at home.

Allied success in the field depends upon maintaining the lines of communication over seas, and it is of vital importance, therefore, that the shipping which is now being used and which will gradually increase with the transport and supply of United States troops must be carefully considered in connection with other essential mercantile shipping.

The war can not be won on the sea, though it may very easily be lost thereon. The campaign at sea resolves itself into protection and maintenance of lines of communication. Generally speaking, it may be said that the plan of campaign on the sea in this war must take one of two general courses. First, the actual prevention or destruc-

Digitized by Google

tion of the submarine itself, either at its base or en route to or from its base. Second ' the protection, control, and coordination of allied shipping and shipping construction in such a manner as to defeat the submarine's mission, granting that it can not be prevented from gaining access to the high sea.

In the absence of a campaign based on the first course, it is vital that every effort should be put forward to insure the success of the latter course mentioned.

The moment a sufficient number of antisubmarine vessels were available, to make possible even a partial convoying of shipping, the losses of merchant tonnage began immediately to decrease in the danger zone. I commented on this in my letter of the 15th of September:

Letter 864, September 11, 1917. General:

With reference to the antisubmarine campaign, generally speaking, the losses since April have not increased but, on the contrary, appear to be on the decrease. This, coupled with the fact that the number of submarines operating has, if anything, increased, is difficult to explain. There is considerable difference of opinion as to the causes for the above. The most reasonable opinion as to decrease in submarine losses and upon which there is the greatest degree of unanimity is as follows:

(*a*) The gradual extension of the convoys system, together with increasing experience of both the merchant shipping and escorting craft.

(*b*) Increase of antisubmarine craft and constant increase of experience thereof, coupled with the more extensive use of the depth charge.

(*c*) Effect on enemy submarine morale from the above, and particularly from the more extensive use of depth charges. It is wholly impossible to estimate the number of actual submarine losses caused by depth charges, but the fact that depth charges are used liberally whenever a submarine is encountered unquestionably has a marked effect upon morale.

(*d*) Difficulty the enemy must be experiencing in maintaining an adequate supply of efficient torpedoes.

I continued throughout the remaining months of 1917, and, in fact, practically up to the time of the armistice, to point out that the number of forces available was still insufficient to meet the requirements of the military situation. Thus, for example, in the concluding paragraph of my general report of December 31, 1917, I said:

Letter, December 31, 1917. General:

Speaking generally of the campaign, it must be recognized that the situation is still very serious, if not critical. The force commander feels that his dispatches, from the very beginning, including the one sent four days after his arrival in Europe, have been fully confirmed by subsequent events. Of course, with the losses being experienced in April, when the force commander arrived, the situation looked even more critical than at present. If the enemy could have maintained the losses inflicted on essential shipping during that month, the consequences would have been disastrous.

A great deal of talk is heard in public, and has also been disseminated by the enemy, indicating a concentration of enemy submarine effort on American troop movements. Speaking generally, however, it is to be noted that the enemy have not succeeded to date in increasing the number of their submarines actually operating at sea. It is not believed that they can materially increase them, owing to many conditions outside of the mere question of construction. There can be no question but that the resources of the world are on our side, and ultimate victory is therefore merely a question of whether these resources can be made available and transported. If the enemy diverts his submarine effort to troop movements, he can only do it at the cost of his efforts against the supply lines of communication.

Speaking generally, it may safely be said that the enemy's best chance of making the submarine campaign the deciding feature, is to concentrate it on these supply lines. As long as we keep our troop movements well clear of the supply lines, the enemy will be forced to divide his effort in case he wishes to concentrate on troop movements.

When I come to take up the convoy, and so forth, I will explain that more fully, and I think you will find it very interesting to see just how much or how little the danger was that troop convoys were in.

Digitized by Google

The need for additional vessels was again pointed out in my letter report of January 8, 1918:

Letter 6044, January 8, 1918. Need for additional vessels—

The need for additional destroyers and antisubmarine craft is just as urgent today as described in all the Force Commander's dispatches beginning from four days after his arrival in Europe.

The force commander believes still that the demands of the common campaign against the enemy warrants sending all antisubmarine craft which can reach this coast either under their own power or in tow.

It has been the policy for some time to send to the French coast every ship available. The last 10 destroyers that were added to the forces have been sent to Brest, but this number is wholly inadequate. The U. S. S. *May* has been sent from Gibralter to Brest, and all yachts now en route will be diverted to the French coast. Unfortunately these yachts will add little to the efficiency of the coast, because they can not keep up with the convoys and hence must be restricted to special uses. The U. S. S. *Alwin* is now en route and on her arrival another destroyer will be added to the forces on Brest. It is evident that the most important part of our work in Europe will be on the French coast, and steps are under way to provide adequate oil supplies and repair facilities on that coast. Additional destroyers are badly needed in order to provide proper protection to our transports and storeships. Every new destroyer arriving from the United States will be sent to Queenstown, and a reliable destroyer sent immediately from Queenstown to Brest. This plan has many advantages, the principal of which are:

1. The destroyers sent to the French coast will be the most reliable ones, and hence require the fewest repairs.

2. New destroyers can better learn methods in Queenstown than at Brest, and defects developing in new destroyers can be better handled at Queenstown than at Brest. What is urgently needed is six or eight destroyers for the French coast.

I might say incidentally, there, that Brest was strategically the best place to base destroyers, but unfortunately it had but a tiny little navy yard and a capacity of only 7,000 tons of oil. We increased that to 28,000 tons, and we had plans on hand to make it 50,000 tons of oil. That is the reason that they were not sent there earlier.

On the same day I had cabled to the department, in my No. 2751:

Need for destroyers in all areas is as critical as in past. Can additional destroyers be furnished, and if so, request prospective dates of arrival.

That is, even in the middle of January, nine months after we had entered the war, I had still received no definite information from the department as to the probable increases in the forces abroad, or as to the program upon which the department was working in sending such forces abroad.

As a matter of fact, however, because the contracts for the war destroyer program were not made until about six months after we had entered the war, the new vessels were not available in any number until the submarine campaign was practically over. The repeated promises of the department to supply additional forces at definite times were not kept, and I often found myself seriously embarrassed in dealing with the Allies because, acting upon the information furnished by the department, arrangements had been made for the dispostion of these new forces, which involved rearrangement of Allied forces, and these could not be made because of the failure of the new forces to arrive. This I pointed out to the department in my letter of the 23d of April, 1918. The official statistics mentioned in the letter I am about to read were brought over and furnished to my staff, as well as to Allied Admiralities, by the Chief of Naval Operations himself, at the time of his visit in November, 1917, and in numerous cases it was the Chief of Operations himself, and not me, who made promises, or at least afforded the Allied Admiralties

Digitized by Google

reason to understand them as promises, but which unfortunately did not materialize.

Letter 15230, April 23, 1918. Arrival of new forces.

The increase of forces in European waters has been very disappointing. But three new destroyers will apparently have been added to the force up to May 1, 1918, that is, *Manley, Stockton, and Caldwell.* The difficulties which have been experienced with the new destroyer program at home are realized, but it is hoped that even greater efforts than have heretofore been thought possible can be put forward to expedite arrival of new destroyers.

Unfortunately, based on official figures obtained from the completion lists of Bureau of Construction and Repair, as far back as November, 1917, the French and British Admiralties were notified of prospective additions to forces in European waters of submarine chasers, mine craft, aviation material, and Ford and other destroyers. This was necessary in order to take up for discussion and begin preparations for the necessary regular docking and overhaul of the additional vessels and provide for the repair of damages due to accidents, etc. Although it is realized that the delays could not have been avoided, still it has been very embarrassing that various programs have fallen so far short of predictions.

This is not meant to be in any sense a criticism or a complaint, but merely to point out that the Force Commander has necessarily felt reluctant in advancing and supporting various measures involving changes in operation under way and program for inauguration of new operations, as suggested by our Planning Section, and from other sources at home, until the number of our own forces engaged had reached a higher point.

Similar reports were made to the Navy Department in the letters of August 24 and September 19, 1918:

Letter August 24, 1918. Need for and enquiries for destroyers.

The prospective additions to European forces of new destroyers is extremely disappointing. The need for an increased number of destroyers on the French coast and at Gibralter is apparent from study of the reports from the commanders of these bases and a general survey of the submarine situation, and particularly the Army's lines of communication. It will also be of the utmost importance that the moment the listening device is developed to a point of practical use by destroyers, there should be a force ready in all respects to take advantage thereof. This requires a great deal of preliminary training and experimenting which can only be obtained by actual trial operations at sea. Unfortunately, it is impossible, except at very infrequent intervals, to set aside any destroyers for this purpose. The importance of applying the listening device to the antisubmarine campaign, the moment it can be used on destroyers, can not be overestimated. The force commander is keenly anxious that the United States Navy should be the first in the field with such a radical development in the antisubmarine campaign.

I might explain there that what we wanted to do, as you were developing the listening devices on this side to be used in connection with the depth charge, we wanted to put those into operation. At the same time I was subsequently informed that I bore the sole responsibility of getting our troop transports over and getting our troops through the danger zone safely; and also that I bore the responsibility for getting merchant ships through the danger zone, and I could not suddenly divert destroyers from the transport of troops to go and hunt submarines. That shows you why it was so necessary to get more destroyers over there. [Reading:]

Letter September 19, 1918. Disposition of forces:

The urgent need for increasing the escort forces, based on Brest and Gibralter, continues as previously reported. As the harbor facilities on the French coast improve, permitting an increased movement of the ships on the Army's lines of communication, the necessity for even greater increase of escort forces will be accentuated.

If the winter weather and ice reduces submarine activity in the western Atlantic and causes submarine activity on this side to come closer inshore as is anticipated, it is urgently recommended that the maximum number of escort ships be transferred to the forces of this command.

The necessity for an increase in the number of tugs and barges in French ports has been conveyed by cable.

Digitized by Google

In repeated cables to the department, in the spring and summer of 1918, it was continually pointed out that all arrangements for the protection of American troop convoys on the coast of France were absolutely dependent upon an increase in the number of destroyers available for this escort duty. This was made necessary by the greatly increased number of troop convoys which had to be escorted, when the number of troop movements from the United States was suddenly increased from an average of about 25,000 a month, for the period up to March, 1918, to an average of nearly 300,000 a month, from the 1st of April on. Thus, in a cable to the Navy Department of April 3, 1918 (my 5976), I pointed out that "the increased demands on destroyers, due to the increased number of troop transports, makes it necessary to coordinate sailings, but priority is given to transportation of troops. Every possible effort should be made to expedite the arrival of additional destroyers."

When the submarines began operating on the Atlantic coast, a number of destroyers, which had been designated for service abroad, were held on the coast for escort duty from Atlantic ports, and the progress of arrivals in Europe was therefore further delayed.

I am at this point introducing testimony so far into 1918 along in the game merely to clearly bring out the accumulated effect of not having thrown our utmost into the war at the very beginning. The inevitable consequence of a sort of hand-to-mouth policy, merely meeting the situations piecemeal as they arose, was that time was afforded the enemy to take advantage of such opportunities and to introduce such diversions as those on our own coast.

I would also like to add here a point which will be covered more fully later on, namely, that it would be impressive, indeed, if I could lay before the committee in any comprehensive, and at the same time, condensed form, the nature of the requests that poured in upon me from my various subordinate commanders for additional forces. Admiral Wilson at Brest, Admiral Niblack at Gibraltar, and even such an outlying force as that of the Azores, never failed in reports to point out the crying necessity for increase of their forces. Although each of them did his best with the forces he had, still I have no doubt that, at the same time, each of them felt that if no more forces could be sent from home, other areas should be reduced to meet their demands. The situation was such that, as a general rule, about all that I could do was to pass on the appeals of these various local commanders to the department, and back them up with urgent recommendations of my own, having already made a distribution of the available forces to meet the situation as a whole, as fully as these forces permitted.

Incidentally I might say that I once asked Admiral Jellicoe what trouble he had in that respect, and he told me that his difficulties were entirely similar, and that he had recently compiled the requests from their various stations where destroyers were based, and in all cases there was a loud outcry from each one of them for more force, and that he made a compilation of that and sent it to each of the stations so that they could see what his difficulties were.

To sum up, that is to say, to sum up this particular section, I trust that I have fully substantiated those portions of my letter which cover (1) the seriousness of the war situation at the time of our entry; (2) the manifest and crying necessity for our cooperation; (3)

Digitized by Google

the clearness and completeness with which it was presented to the department; and (4) the department's hesitating methods and lack of policy in meeting the situation thus so clearly presented. I hope also that I have demonstrated a point which will be brought out more clearly in testimony, still to be introduced, as to the nature of my duty abroad, and the fact that I put forth every effort within my power to carry it out with the personnel and means available.

As I have stated, the situation was so serious, and the consequences of failure so terrible, that I went beyond the channels which the Navy afforded me, and enlisted the services of such men as Ambassador Page.

No one in this country can yet realize the great part which that man played in the war, but I hope that I have to-day indicated at least one phase of his varied and important activities, showing that, whenever the occasion arose, he was willing to join with the Navy, or any other Government work, provided it would help along the Nation's interest.

The importance of a proper realization of the extreme crisis in the allied cause as a whole in the spring of 1917 is so vital to an understanding by the committee of the issues that I have raised that I feel that the committee should hear, from other independent sources, corroborative evidence on this point..

From my standpoint the greater part of the criticisms of the action of the Navy Department's conduct of the war are based upon their failure to take decisive action in the first few months, and this can have been due only to their failure to realize the seriousness of the situation and to accept the testimony of their own accredited representative abroad.

Of the many men who could speak with intimate knowledge of the situation in Europe in 1917 there is one at present in Washington who gave me, when I arrived in London, one of my first realizations of the possible defeat of the Allies in a short time. He pointed out to me then this very fact which I am emphasizing, that is that the shipping situation was such that it would soon be impossible for the Allies to obtain the essential military supplies and the food to keep them going until American effort could become effective. The one man above all others who has been familiar with the world's food and shipping position in the last five years, and who administered the food resources of this country during the war, is obviously in a position to state with authority what the situation was in this respect in April, 1917, and I should, therefore, like the committee to call Mr. Hoover at its convenience, in order that there may be no doubt in my mind that I have substantiated the part of my letter in which I describe the gravity of the crisis which we faced in 1917, and pointed out how near to a disaster the lack of action by the department at that time brought us. The Allies, indeed, barely escaped a peace without victory.

I had word from Mr. Hoover this morning that he will be in Washington on Saturday and will be willing to appear before the committee if the committee so desire. It is immaterial to me as to when he should come, but I would suggest that as he is an extremely busy man——

The CHAIRMAN. Without objection, we will ask Mr. Hoover to appear before the committee on Saturday, and you will suspend your testimony while we hear from him?

Digitized by Google

Admiral SIMS. Yes, sir.

Now, I should like to take up the question of the lack of reinforcements, and to state specific instances.

It has thus far been established:

1. That the Allies were losing the war at the time the United States entered as a result of mercantile tonnage losses, as this practically amounted to cutting the allied lines of communications.

2. That the department was fully informed of the fact that the one vital issue to be faced was this submarine campaign.

3. That whatever plans the department or the Government in general may have had in mind in future operations, it was pointed out at the time, and subsequent events established the fact, that the execution of any other plans depended absolutely upon first meeting the submarine menace.

4. That at the present time there is no issue whatever as to the correctness or soundness of my recommendations during this critical period. There is no truth whatever in the assertion that I am now claiming that I was right and everyone else was wrong. This fact is amply demonstrated by the extent to which my recommendations, particularly in the matters of dispatch and employment of antisubmarine forces, were ultimately adopted by the department. As I shall show later on, certain recommendations made by me were never adopted, but, with one or two possible exceptions, every plan for the employment of our forces in the war zone which was finally adopted was in accord with my recommendations.

5. That the primary fault of the department was the initial delay in putting into effect measures which they later adopted, and which delay resulted in the prolongation of the war and in the unnecessary expenditure of at least half a million lives and $15,000,000,000.

Thus far I have dealt more particularly with my requests for the sending and employment of antisubmarine forces. I now desire to consider in a general way the action taken upon various recommendations, some covering the dispatch of antisubmarine forces, but principally relating to other subjects, in order to show that these recommendations were either disregarded altogether, were adopted after a delay of some months, or were accepted only when recommended by Admiral Mayo and Admiral Benson during their visits abroad in August and November of 1917, respectively.

I will also introduce testimony to show that, as a result of the wrong estimate of the situation upon which the Navy Department acted, and, incidentally, as a result of its failure to adopt the recommendations made by its representatives abroad, after a full and intimate study of the situation, the department concentrated its efforts upon plans which were either of minor importance or were impossible of fulfillment in view of the time element, or were completely and entirely impracticable.

I want to bring this point out to show the great evil and the great danger of trying to manage the military operations of war by cable from a distance of 3,000 miles.

To take up, for a moment, the question of the department's disregard of specific recommendations, it is only necessary to refer back to the cases which I instanced in my letter of January 7. As I pointed out in paragraph 31 of that letter, I suggested in my first cable and in my first letter, which I have read to you, that American

Digitized by Google

dreadnoughts would be very useful, if based on Brest, in meeting any possible raids by German battleships or battle cruisers in the Channel, or in forestalling such raids by the mere moral effect of their presence, which would, of course, be known to the enemy. Thus, in my cable of April 14 I said:

Cable April 14, 1917:

At present our battleships can serve no useful purpose in this area except that two divisions of dreadnaughts might be based on Brest for moral effect against anticipated raids by heavy enemy ships in the channel, out of reach of British main fleet.

Then in my letter of April 14, I said:

27. In addition to submarines, heavy forces are free to raid, and in fact escape through the channel at any time when the enemy decides that the necessity or return will justify the risk. Hence the suggestion that two divisions of our fast dreadnoughts might be based upon Brest primarily for the resulting moral effect against such possible raids.

I was told yesterday by an important admiralty official that while he thought the chances of raids in or escape through the channel by heavy enemy forces out of reach of the Grand Fleet (North of Scotland) were very remote, nevertheless the possibility existed and was principally thwarted on moral grounds; that is, the uncertainty in his mind of the opposition which would be encountered. He agreed with others, including the First Sea Lord, that the addition of some of our heavy forces to those maintained in southern channel approaches by the French and British would undoubtedly entirely preclude the possibility of such raids.

No answer was ever received from the department to either of these recommendations, although as I had specifically stated, this assistance had been requested by the Allies. As will be shown in later testimony, this is but one of a series of obstacles which I encountered in carrying out my mission assigned by the department—obstacles which were caused by the action of the department in leaving me ignorant of their plans, if they had any, or at least of their understanding of the various recommendations which they sent me abroad to make.

While we are dealing with the question of the use of American battleships abroad, I will also take up the case of those battleships which actually did get into the war zone, and which attracted such universal attention by the excellent work they performed.

Let me say right here that while some people think, unfortunately, those battleships never had a real opportunity to come to grips with the enemy, still the extent of the cooperation of those five battleships under Admiral Rodman was one of the best pieces of work of the kind that I had ever seen. It was a question of cooperation, it was a question of adopting the system which was being employed in the Grand Fleet. Perhaps it is difficult for a civilian to realize that the addition of four battleships to a fleet that is already organized makes that fleet weaker than it actually was before they arrived, because they can not cooperate together, and new arrivals may ball up the game.

The consequence is that they have got to learn the methods that the big fleet used; and actually, after that fleet arrived, we put our methods, our code books and our flags, down in the hold, we adopted those of the British, they sent men to instruct our signalmen, and in four days they went to sea with the fleet, and in a little while they were able to cooperate with them. It was one of the finest stunts I have ever known. It has been reported to me—in fact I remember now that when I visited the fleet on one occasion Admiral Rodman

Digitized by Google

said, at his mess table, "In all the time that I have been here I never received a single order from you as to how I was to handle this force." That is giving the initiative to the other man. Of course I replied that the reason I did not give him any orders was that he would not obey them if I had; but that was just a mild joke.

While I had not specifically recommended the sending of a division of our battleships as a reinforcement to the Grand Fleet until July 21, I had repeatedly recommended in letters to the department that, in accordance with the policy of regarding the whole of our naval forces as a reinforcement to the combined allied naval forces, our battle fleet should be kept prepared for distant service at a moment's notice in order that, to quote from my letter of May 11, "their use if the opportunity should occur will not be in any way delayed."

In my letter of June 15, I again recommended the maintenance of our fleet in readiness for action in the following paragraph:

Except in one of my first cablegrams, I have not mentioned the above considerations in dispatches or reports, because, as stated above, they have not been discussed officially; and as the submarine campaign is at present the vital issue, and also as I am not aware of the department's policy or plans regarding any forces except those now under my command, I have not thought proper to discuss such subjects upon my own responsibility. The fact can not be overlooked, however, that sound strategy calls for the concentration of our maximum forces as close as practicable to the probable theater of war, provided they can be supplied there without requiring the services of tonnage now vitally necessary.

Again in my letter of July 7, I said:

Letter to department No. 18, July 7, 1917.

11. I would also urge that all coal-burning dreadnoughts be kept in a constant state of readiness for dispatch to European waters, purely as a measure of preparedness. There are no definite plans in view involving such forces, but the uncertainties of the present situation are tremendous, and hence my recommendation.

The oil situation in Europe is now so critical that it would be impossible to send oil-burning battleships, even if sufficient oil carriers should be available to supply the necessary oil, it would be impossible to insure adequate and safe destroyer escort through the submarine zones.

It was at about this time that the question of reinforcing the Grand Fleet, with a division of our coal-burning battleships, was taken up with me by Admiral Jellicoe. At his request, I went with him to the Grand Fleet on July 19 for a conference with Admiral Beatty. As a result of this conference I sent the following message to the Navy Department:

Cablegram sent July 21, 1917:
To Secretary of the Navy (operations). Serial No. 120.

No. 120. Visited Grand Fleet 19 with Admiral Jellicoe for consultation with commander in chief. The result is that admiralty request that the four strongest coal-burning battleships with six destroyers be sent join Grand Fleet now in Firth of Forth. Also that our submarines could be very usefully employed in antisubmarine campaign.

The reasons for this request is that five *King Edward* class must be placed out of commission and their place taken by four dreadnaughts to provide officers and gunnery and torpedo rating for light cruisers, destroyers, submarines, etc., to be commissioned. Shortage of officers will be found 100 after advancing reserve officers from motor boats, etc. to fleet. Our oil-burning battleships could not be supplied, and more than four would unduly increase burden on coal supply and would necessitate additional screening vessels not now available.

The conference agreed that moral effect would be very great, also mutual benefit of exchange of ideas and methods. The intelligence service thereby created between the two fleets would be superior to any service which exists or could be established. Carefully selected expert staff should be sent. Also recommend temporary detail representative our commander in chief on Admiral Beatty's staff.

SIMS.

Digitized by Google

No answer was received to this message. After waiting for four weeks, believing that an answer to such an important recommendation would ultimately come, I finally sent a second message, on August 17:

[Sims, Admiral United States, 285.]

AUGUST 17, 1917.

Referring to No. 120. Need becoming urgent for the four coal-burning dreadnaughts and their six destroyers; shortage of personnel has necessitated putting one *King Edward* out of commission. One goes out next month and five by end of year. In their absence, reinforcements are requested; these vessels must be replaced by older type of dreadnoughts from Grand Fleet. Request information as to department's decision. 18217.

SIMS.

That requires a little explanation as to why they would have to be replaced with more than one. This *King Edward* was employed elsewhere. They had to keep a certain number in the neighborhood of the Thames and the Humber to guard against raids, and if they put them out of commission they would have to be replaced from the older dreadnoughts from the Grand Fleet. That is why they wanted us.

In reply, the Navy Department cabled me on August 20 their refusal to approve this recommendation. Their dispatch was as follows:

Received: AUGUST 20, 1917.
For: Admiral Sims.
From: Chief of Naval Operations.
Opnav 198.

Replying to your 285, United States believes that the strategic situation necessitates keeping battleship force concentrated (that is our battleship force), and can not therefore consider the suggestion of sending a part of it across. The logistics of the situation would prevent the entire force going over, except in case of extreme necessity. The department desires that you discuss situation with Admiral Mayo upon arrival. 10019.

ADMIRAL BENSON.

In a letter of September 1 to Admiral Benson I again urged the sending of this reinforcement:

To: Admiral Benson, September 1, 1917.
Admiral Sims's personal file.

There is one thing about which I am really anxious, and that is as to the final decision of the Navy Department in sending to this side the battleship reinforcement which the situation in the Grand Fleet requires. As you know, I do not understand what is really meant by the disintegration of our fleet. I do not see how it will ever be possible for it to engage in a combined operation, as a unit, with the naval forces of the Allies. For example, in all of the schemes that I have seen proposed for aggression against the enemy, the naval forces of the Allies have been distributed according to types. The scheme proposed by Winston Churchill required the organization of two fleets, each composed of certain types of British, French, and American vessels. Another proposal for blocking the enemy fleet in port would require the sacrifice of certain of the older battleships and cruisers of all three nations, to block the channels leading to German ports.

I have explained in my cables and letters why it is that the British Fleet needs a reinforcement of some of our dreadnoughts. I can not see that the sending of this division of ships would be any disintegration of our fleet, but merely an advance force interposed between us and the enemy fleet.

No man can tell what the outcome of this war will be. But whatever the outcome proves to be, we must at the end find ourselves in a position which can be justified on sound military principles. Can we afford to have history record that the Allies asked for reinforcements and that we declined to send them?

Admiral Benson replied on the 24th of September. I will read you the extract of his letter with regard to the battleships:

Digitized by Google

From: Admiral Benson, September 24, 1917.

We are not willing to send a portion of the battleship force, and do not intend to unless very much stronger arguments are produced than have so far been set forth. It has been a surprise and disappointment that no definite plan of operation of the combined forces of the allied naval powers has been taken up and decided upon long ere this. I consider this most urgent, and it certainly should be done at the earliest possible date, and if nothing can be done this fall or winter, preparations should be actively under way to carry out some definite plan of operation as soon as spring of 1918 opens.

When Admiral Benson himself arrived in November, 1917, this was one of the first subjects discussed with him, and after he had conferred with the British naval authorities and satisfied himself, which he did inside of a few hours, he sent, within two or three days, his No. 13683, department, recommending that a division of four coal-burning dreadnaughts be sent immediately. This was on November 8.

On November 13 the reply was received by Admiral Benson from the Secretary of the Navy granting his request, without discussion, and stating that the ships, after docking, would be ready to sail about November 25. This cablegram speaks for itself. (Reading):

[Cablegram received November 13, 1917.]

SIMS, Admiral, United States:

1093. From Secretary of Navy for Admiral Benson: After consultation with Admiral Mayo that following coal-burning dreadnoughts were selected to form divisions to be dispatched to England: U. S. S. *New York*, U. S. S. *Florida*, U. S. S. *Delaware*, U. S. S. *Wyoming*.

These ships, after docking, should be ready to sail about November 25. Rear Admiral Rodman will command this division. 17012.

BENSON.

That is the message I received on November 13, 1917.

It was the practice of the Navy Department for cablegrams coming from the department to be signed "Benson." He was on the other side, but this was signed "Benson." It might be interesting to state the fact that all of those vessels were of different types. One of them had 14-inch guns and the others 12's. They could just as easily have selected a homogeneous squadron, but it was not done. The reason was that they were not ready for sea service.

The action of the Navy Department on the recommendations for the use of submarines shows exactly the same hesitancy, delay, and the final adoption, months later, of the policy I had repeatedly outlined. You may recall that in my first letter, that of April 19, I said in the concluding paragraph that the use of submarines in anti-submarine operations "promises well, and the experiment is now being tried with as many submarines as can be spared from the Grand Fleet. Some enemy submarines have been destroyed by this method, usually torpedoed."

I might say there that nobody knew much about what submarines could do when this war started. I have been surprised, in looking up the data on that subject for a certain article which I wrote recently, to see the officially recorded opinions of prominent naval officers of various navies, including the German, British, and others, as to what the submarine could do. We did not know. It was generally supposed that the submarine was of no use to chase another submarine. Somebody failed to reason out the thing, or he would have seen that

Digitized by Google

it was the most effective of all means of attacking and destroying a submarine. I have explained that in the articles referred to. I pointed out at this time that such use of our submarines would be very advantageous, not only in attacking the enemy submarine, but in giving us reliable information as to the operating condition of enemy submarines, through the experience of our own vessels in the war zone.

The reason that it is the best means of destroying submarines is due to the same difficulty that I have spoken of before, that the submarine can always see a surface vessel miles away and avoid her; but when we send out a submarine to hunt submarines, the advantages are equal if they are both operating on the surface—or submerged, for that matter; but as a German submarine has to stay on the surface all the time except when he dives for business, because he has to keep his batteries fully charged, it follows that our submarine can go out and remain under the surface all the time, showing his periscope only once in a while for 10 or 15 seconds; and that gives us a great advantage, and our submarines can do that because they are no German destroyers on the surface that they are afraid of, and the consequence of that is that in proportion to the number of submarines and destroyers operating, the submarines destroyed from three to five times as many enemy submarines as any other type.

In a cable of June 28 I specifically recommended that all submarines available should be sent. My message was as follows:

Sent 28 June, 1917:

To: Secretary of Navy.

Protection of all Allied shipping in time—I repeat in time—is present mission. Whatever efforts we can exert must be put into operation at once if they are to be effective. Reliable submarines would be of great use to strengthen British submarine patrols, and also to scouts ahead of convoys. All submarines we send to Irish coast in time will therefore be invaluable in insuring success of convoy system, and hence success of war, provided these submarines are supplied from America and based upon their own mother ships.

SIMS.

You can not base a submarine on anything but its own mother, because they are so different.

In my letter-report of July 14 I again emphasized the value of submarines as antisubmarine craft.

Letter No. 29, 14 July, 1917:

There is also no question but that submarines themselves will prove of the greatest value as antisubmarine craft. They constitute the one type of ship that can see the submarine as far as the submarine can see them, and hence their use as scouts ahead of convoys in those areas in which the enemy submarine must approach if a successful attack is to be assured.

In a cable of July 13, referring to the submarine operations in the Azores region, I transmitted to the department a request from the Admiralty for the sending of some of our submarines to the Azores for operations there. I received no reply to any of these recommendations.

When Admiral Mayo arrived in England in August, 1917, the question of sending some submarines was taken up with him, and he accordingly cabled the Navy Department recommending that sub-

Digitized by Google

marines be sent. Almost immediately, on August 24, the following reply was received from the department:

AUGUST 24, 1917.

For: Admiral Sims.
From: Chief of Naval Operations.
Opnav. 228. It is possible that about middle of October five submarines, K class, will arrive England followed about two weeks later by five of the L class. Tender accompany. What will be their prospective duties and where based? 17023.

ADMIRAL BENSON.

After discussion with the various Allies represented at the naval conference in London in September, it was agreed that a division of these submarines should be based on the Azores for operations against enemy submarines in that area, and that the second division, to be composed of the L submarines, should base on Berehaven, Ireland.

At the end of October the K boats arrived at the Azores, approximately six months after I had first called the attention of the department to the value of submarines as antisubmarine craft. The L submarines did not arrive at Berehaven until the end of January, or six months after I had specifically recommended in July that they be sent.

I might add here, as a mere matter of information for the committee, that not only do the final records show that in proportion to the numbers engaged, submarines were the most effective antisubmarine craft, but also, as was pointed out in many letters and dispatches which I have not read, they had a very marked strategic and moral effect on the submarine campaign. Before they were used in waters frequented by the enemy, the enemy submarines always had an easy mind as long as no surface ships were in sight. On the contrary, when the allied submarines were put into the game, and every now and then the enemy was attacked by an unseen foe, it is easy to see that his nerves were bound to be upset. This was the principal reason for recommending submarines in the Azores region. We would have made it a point to allow the enemy to know of their presence at once.

Much the same fate met my recommendations with regard to the sending of tugs as in the cases I have just referred to. Thus, in my letter of Jauuary 7, paragraphs 33 and 34, I pointed out that from the beginning I had specifically recommended the sending of tugs and that none were actually sent until nearly a year after we had entered the war.

America is, I believe, the country of tugs.

The only reason, to my knowledge, that was ever advanced for not sending tugs was that in some way there was a legal technicality in the laws, which were passed for commandeering privately owned craft, which prevented the department from securing tugs. The only comment that I have to make on that point is that, in view of the other feats of this country in the war, and of the previously supposed insuperable obstacles which were overcome, it is hard for me to accept the explanatian that a small technicality in the law should have prevented us from rendering this extremely important assistance to the Allies.

In my first cable, that of April 14, I had informed the department that "for towing the present large amount of sailing tonnage through dangerous areas, seagoing tugs would be of great value."

Digitized by Google

There are a number of cables concerning tugs here, which it would only worry you to read. I have summarized these here, and I will only submit them for the record.

The summary submitted by Admiral Sims is here printed in the record, as follows:

Op–11. JANUARY 28, 1917.
Confidential.

Present assignment of seagoing tugs other than district tugs.

At bases 7 and 8 (France).

Sweepers: *Hinton, Edwards, Cahill, Bauman* (sunk), *Hubbard, James, Douglas, Courtney, Anderton, City of Lewes, McNeal.*

Tugs: *Genesee* en route base 6 with submarines; *Barnegat, Concord,* at Azores, will be sent to base 7 with French chasers.

These are the three tugs Admiral Benson promised Admiral Sims to send to France.

At base 9 (Gibralter): *Nahant, Penobscott,* at Azores. Admiral Sims has orders to send them to Gibralter.

Assigned to escort duty for submarine chaser: *Gypsum Queen,* at Azores, will return to United States; *Momtauk* en route Azores, will return to United States from Bermuda with submarine chaser *173. Conestoga, Lykens, Mariner, Hackett,* ready at New York. Ordered New London. *Wilmot, Henlopen,* ready at New York. Ordered New London (originally bought by French Government). *Arctic* en route to Hampton Roads from Puget Sound.

Confidential.

Fitting out to be assigned as escort for submarine chasers: *Cherokee,* navy yard, Philadelphia, completion February 1; *Edwards,* navy yard, Boston, completion indefinite; *Sea Rover,* navy yard, Mare Island, completion February 9; *Dreadnaught,* navy yard, Mare Island, completion indefinite; *Undaunted,* navy yard, Mare Island, completion indefinite; *Goliath,* navy yard, Mare Island, completion February 9.

With fleet: *Uncas, Wando, Tavernilla, Gorgona, Chemung.*

With mine force: *Patapsco, Patuxent, Sonoma, Ontario.*

Port au Prince, Haiti: *Potomac, 785.*

Yard tugs suitable for outside work: *Arapaho,* 575 tons, 800 horsepower, Mare Island; *Apache,* 650 tons, 550 horsepower, Iona Island; *Fortune,* 450 tons, 340 horsepower, Tutuila; *Iroquois,* 702 tons, 1,000 horsepower, Pacific Fleet; *Mohave,* 575 tons, 800 horsepower, Puget Sound; *Navajo,* 800 tons, 935 horsepower, Honolulu; *Osceola,* 571 tons, 800 horsepower, Guantanamo; *Piscataqua,* 854 tons, 2,000 horsepower, Guam; *Tillamook,* 575 tons, 800 horsepower, Mare Island; *Wompatuck,* 462 tons, 650 horsepower, Asiatic.

NOTE.—Recommend they be sent to east coast.

The *Allegheny* and *Sagamore* are icebound in the St. Lawrence River and will not be available until spring.

Construction and Repair have reported that six new tugs will be completed in a few months.

Of the 36 mine sweepers under construction, 8 will be completed by March 15 and 25 by July 1.

In a second message, sent on April 23, this recommendation was repeated, with the statement that "ocean-going tugs are needed for towing sailing vessels and for bringing in steamers that have been torpedoed and often float for some hours. * * * Large tugs now doing harbor work can be released if small tugs are sent. Tugs should have portable salvage pumps, and be fitted with radio and tydrophones. The tugs may be built either of wood or steel. The salving of even two or three ships would have invaluable results. Therefore cable what can be done in regard to the supply of tugs."

No reply was received to either of these messages.

On April 29, 1917, I sent another cable to the department, urging that four big Navy tugs be sent, and again pointing out the importance of the salvage work they could accomplish.

Still no reply was received from the department.

Digitized by Google

On May 8 I sent the following dispatch:

MAY 8, 1917.

To: Secretary of State, Washington
(Through State Department).
6166.

May 8, 2 p. m. Following to be transmitted confidentially to Secretary of the Navy. Begin. Situation continues critical. Total loss last week 113 vessels of 248,000 tons, including 15 vessels of 28,000 tons, of week before not previously reported. Many steamers and sailing vessels being lost which would be saved if tugs were available and strategically located. Therefore urgently recommend that as many seagoing tugs as possible, at lease 10 immediately, be added to our naval forces here. Tugs should be commissioned and armed.

All the figures with reference to the loss of tonnage which appear in my testimony are taken from the official records. Those figures which were published from time to time during the war, and a great many of those which have been published since, have been taken from newspaper file records and are not correct.

This request was repeated in other dispatches sent on May 14, May 24, June 20, and June 21, and in my letters of June 1, June 20, July 14, and August 9.

In my cable of May 24, I said:

Cable sent May 24, 1917.

To: Secretary of the Navy (Operations).

All Navy tugs, or commercial seagoing tugs, with naval officer in command, which could be sent would be of incalculable value in rescuing torpedoed and mined ships. The salvage and rescue work being done in this area by the limited number of tugs and trawlers and cruisers from antisubmarine work is astounding. The number of torpedoed and mined ships which these vessels have beached or brought into port is surprising. Derelicts are a most constant source of danger to both shipping and naval vessels. Numerous lumber vessels are adrift bottom up. All vessels so employed are necessarily diverted from antisubmarine work, and hence all tugs or similar craft which could be sent for this work will amount to an actual increase of antisubmarine forces.

SIMS.

No answer was received to any of these cables.

On April 27, the naval attaché in London had sent to the Office of Naval Intelligence a long and detailed statement of the reasons that tugs were needed in the war zone, and the duties which they could perform. This letter also forwarded detailed plans by the British for employment of tugs, which clearly set forth the manner in which all tugs would be employed. But the only reply received was in a letter from the Director of Naval Intelligence, dated May 22, of two brief paragraphs, stating simply that the department was prepared to cooperate with the Admiralty authorities to the fullest extent possible; that they were experiencing difficulty in securing tugs and in building new ones, and also, the rather remarkable statement, in view of our lack of cooperation, to the effect that American sailing vessels would be advised to accept a tow in the war zone.

One point about the necessity for tugs was this, that so many damaged vessels went down at the end of a certain number of hours, or sometimes at the end of a certain number of days, which could have been brought in and in a very short time could have been repaired and put back in service; a short time compared with the length of time it takes to build a new ship.

Digitized by Google

To anyone who has visited our Atlantic ports, to say nothing of Pacific ports, or who has cruised up and down our coast line, it will be hard to understand the fact that, in such a crisis as that with which we were confronted at the time here under discusssion, the United States Government was unable to produce for a period of one year more than four tugs.

Finally, on August 8, 1917, the following dispatch was received from the Navy Department:

Date: 8 August, 1917.
From: Chief of Naval Operations.
To: Admiral Sims.

Opnav. 192. It is the department's intention to take over 12 seagoing tugs from commercial service and fit them for distant service. They will not be ready to sail abroad for approximately two months' period. Should they be fitted with mine-sweeping gear? Their draft is 15 to 18 feet. 13108.

ADMIRAL BENSON.

To this the following reply was sent:

No. 314. Referring to Opnav. 192, mine sweeping gear not desired. Recommend depth charges be fitted after arrival this side.

SIMS.

Nothing more was heard from the department about these tugs, and I cabled again on December 18, requesting the probable sailing dates of these same 12 tugs. To this message I received no reply.

In the meantime I had, in letters and cables, continually pointed out the continuing need for such craft, as, for example, in my letter of December 17, 1917, when I said:

Letter 4844, December 19, 1917:

15. Necessity for tugs.

As has been reported, in previous correspondence and cables, the urgent need of sea-going tugs still exists. A great deal of shipping could be saved if tugs were available for towing. In fact, it would be important and invaluable if a sea-going tug could accompany the escort of all convoys through the danger zone, the tug serving as an additional escort ship when not in use for towing.

There is also urgent need of salvage tugs and equipment and personnel.

The salvage companies in England were badly broken up in the early part of the war, their personnel and craft being absorbed into the naval service and scattered. Since then urgent need for their services has developed and every effort has been made to reassemble them for salvage work, and there is a large and useful field for any assistance which could come from the United States under either Government or private control.

There is also a need at all of our bases for the services of tugs. Every effort is made to increase the amount of time that our destroyers and patrol craft can keep the sea and hence it is important the moment that they enter port they be allowed to let fires die out to facilitate overhaul and repair. This creates the necessity for tugs to move the ships about the harbor and alongside the docks.

At the time of the naval conferences in London in September, 1917, the Italian representatives had requested that two tugs be assigned to the Italian Government fror use on the Italian coast. The department, in October, announced that these tugs were to be sent, and they finally arrived at Genoa at the end of February, 1918.

Digitized by Google

That the department realized the value of tugs for antisubmarine work is fully shown by a letter sent by the Chief of Naval Operations to the Shipping Board on December 5, 1917:

DECEMBER 5, 1917.

Op-28.
From: Chief of Naval Operations.
To: Chairman of Shipping Board.
Subject: Tugs—steam trawlers—fishing craft.

1. The great demands that have been made upon this country, and coming under naval notice, to furnish tugs and trawlers to be used in the following general manner:
(*a*) For general naval and military service abroad.
(*b*) For strictly naval service at home in coast defense—patrol and sweeping.
(*c*) For general service at home—coast towing—harbor towing, fish trade, etc., have led this office to consider the probable future necessity for an adequate supply of this type of useful small craft.
2. No other types, save, perhaps, destroyers, submarines, and high-class cargo and troopships are quite so useful now, and it is a type which this country will continue to need in the future.
3. For the above reasons this matter is brought to your attention. The Navy is attempting to meet its own needs in the matter of tugs, but even with those laid down and planned for, the demand will greatly exceed the supply.
4. There is inclosed a copy of letter containing a few characteristics of a type which Great Britain is finding useful. Also inclosed is a letter from Mr. Hoover to Navy Department, on subject of vessels for fish trade.

W. V. PRATT, *Acting*.

A copy of that letter was supplied to me by the Navy Department when I was over on the other side.

It is a rather curious commentary upon the department's attitude toward supplying recognized needs, that this letter is dated December and not April, 1917.

On receiving the letter from the department, inclosing a copy of this letter to the Shipping Board, I sent, on January 12, 1918, the following cable, again emphasizing the urgency of the need:

JANUARY 12, 1918.

Paraphrase.
From: Sims.
To: Opnav.

Your 1693 and general subject tugs. Admiralty letter of January 12 urges importance tugs in connection naval work these waters. Letter says now very difficult to obtain tugs, and as large force American vessels now operating European waters and increasing number United States transports using European ports, corresponding increase number tugs available is necessary. Admiralty letter further states: It is possible that a considerable number of large seagoing tugs might be constructed in the United States, and I am to ask whether any help could be given toward the provision of additional tugs in European waters by the building of tugs in United States. I have in reply given all the information in my possession regarding tugs, and I wish again to urge on department the very great importance of sending all available tugs to these waters. As the number of tugs now in existence is probably insufficient for the war needs, the question of constructing additional tugs warrants serious consideration.

SIMS.

In reply to this message, I received the following cablegram from the Navy Department:

Copy of cable sent Shipping Board with letter. Matter was taken up, early in December, of advisability of the inclusion of an extensive tug program in their building program.

And this was on the 18th of January, 1918. In my letters of December 31, January 8, January 14, and in many later letters, I continued to emphasize the need for tugs.

Digitized by Google

In a departmental memorandum furnished to me, dated January 28, 1918, the following tugs were then available, none of which had been constructed since war was declared, and hence all of which must have been available from the beginning of our entry into the war. Here is this list of tugs:

Three then en route, 1 with submarines, 2 bound for Gibraltar for assignment to the Italian Government, 2 escorting submarine chasers, 6 ready at New York, 1 en route to Hampton Roads from Puget Sound, 6 fitting out for submarine chaser escort duty, 9 with home fleet, 1 in Haiti, 10 in navy yards, but noted suitable for high-sea work, 2 noted to be icebound in the St. Lawrence River.

The CHAIRMAN. It is nearly 12 o'clock now, Admiral, and if you have no objection the committee will stand adjourned until to-morrow morning at 10 o'clock.

Admiral SIMS. Yes, sir.

(Thereupon, at 12 o'clock m., the subcommittee adjourned until to-morrow, Friday, March 12, 1920, at 10 o'clock a. m.)

Digitized by Google

NAVAL INVESTIGATION.

FRIDAY, MARCH 12, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met pursuant to adjournment at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, and Trammell.

The CHAIRMAN. The committee will be in order. Admiral Sims, will you continue?

STATEMENT OF ADMIRAL WILLIAM S. SIMS—Resumed.

Admiral SIMS. In going over my testimony of yesterday, I note two points that may have been susceptible of misinterpretation. My reference to the volume of communications of our naval headquarters referred, of course, to all official communications for the period of the war, from which I am now introducing selections in substantiation of my letter of January 7. My only object in making the reference was a further attempt to give the committee an idea of the extensive and complicated background of the issues now being investigated, and of the great difficulty confronting me in presenting the case in brief form to a body which was not in a position to be familiar with such a background.

My reference to armed United States merchantmen sunk should have read that among the first ships to be sunk, after we entered the war, were two which were well armed. I have not the records to substantiate whether they were sunk on their first or second voyages. The essential point is that their armament was not and could not be an effective safeguard against submarine attack without warning.

When the committee adjourned yesterday, I had just finished reading a cablegram from the Navy Department, saying:

> Copy of cable sent Shipping Board with letter. Matter was taken up, early in December, of advisability of inclusion of an extensive tug program in their building program.

This was on the 18th of January, 1918. In my letters of December 31, January 8, January 14, and in many later letters, I continued to emphasize the need for tugs. I then mentioned the fact that a departmental memorandum had been furnished to me, dated January 28, 1918, giving a list of the tugs available, and I presented that list for the record.

This was to say nothing of the multitude of tugs which were in sight on every hand on our coast lines.

Digitized by Google

In my cable No. 4137, of February 19, 1918, in reply to a request from the department, I made specific recommendations as to the tugs required.

Cablegram sent February 19, 1918:

Prep. by Cs. NCT. 25 ADR.

4137. Your 2873, tugs desired for duty as follows:

British waters, 12; French waters, 6; Azores, 2; Mediterranean, 16, of which 12 for Italy. Number of tugs that could be used advantageously is not limited to the numbers specified, but these are very much needed under present conditions and would be constantly employed to advantage if now available. This cablegram is not to be construed as changing my previous recommendation made in my 3042 of January 18 regarding convoying and towing submarine chasers.

SIMS.

Many other similar dispatches and letters could be quoted, but it is believed that enough has been said to show that in this specific case where recommendation was made for the sending of forces urgently needed—a need which the department themselves recognized, as is shown by their letter to the Shipping Board—no tugs except the two assigned to the Italian Government actually reached European waters for duty until April, 1918—that is, one year after war was declared. Up to the time of the armistice the Navy had less than a dozen tugs in European waters.

Apart from the tremendous value of tugs as an auxiliary antisubmarine craft (through their ability to thwart submarine losses by towing ships in before sinking), we had to have them for many other essential purposes—for example, moving our naval ships about in harbors, handling barges, assisting the Army in discharging our troops in harbors without docks, etc.

The supply was always less than the demand. I have already stated that the Allies were woefully short of such craft. I wish I could take the time to paint the picture of how our officers hunted in England and France for any old harbor tugs or barges which could be repaired and pressed into this service. It was from such sources that our essential tug assistance came during the early months of the war. Such tugs worked constantly in support of our naval forces and transports on the French coast.

At sea we were largely dependent upon British tugs. It was such tugs who first reached and towed in the large transport *Covington*, torpedoed off the French coast; also the *Westbridge* and other United States Army supply ships.

If this was naval preparation or naval cooperation from a country of such great resources as ours, I do not know the meaning of the words.

As the department not only failed to approve my recommendations, but did not even inform me of their disapproval and kept me in suspense all the time, I naturally assumed that they were proceeding to carry out the recommendations, but had merely failed to inform me.

In a way these last two cases that I have given may be considered details; and so they were, but they were details which show all the more strikingly the relations which existed between the Navy Department and their representative in the councils of the Allies.

A case, however, infinitely more serious in its consequences was the delay of the department in accepting the recommendations for the convoy system, in delaying its establishment for some months, with

Digitized by Google

the direct result that some hundreds of thousands of tons of shipping were lost unnecessarily to the allied cause as a whole.

I think that in my first day's conference with British naval leaders the first thought that occurred to my mind was the ancient convoy system, such as that pursued in Napoleonic and many other wars. This point naturally came to everyone's mind. I found, of course, that it had received the fullest consideration by the British authorities. I was confronted with a great mass of data which had caused them to delay so far in resorting to this measure. Principal amongst the arguments against the convoy system, I might cite two: First, the merchant service itself was violently opposed to any such system. They claimed that it would greatly slow down the movements of ships, which, of course, it would, and also they proclaimed loudly their inability to steam in close formation. Second, the shipping companies were almost unanimous in resisting anything approaching to the convoy system. Figures could easily be given to show that in the space of a year the slowing down of ships by the convoy system would constitute in itself a serious loss of essential supplies.

For myself, I could not agree from the first with these objections, and I took my place on the side of those who favored this measure. Nevertheless, I fully appreciated all the obstacles.

I kept the department fully informed of all developments in regard to the convoy system. It is rather a long story, but it is sufficient to say that the situation became so critical that in May, 1917, the allied leaders were simply forced to do something different from what they had been doing, and they therefore overruled all of the objections which had been advanced against the convoy system, and started in to carry it out.

I will show, from the dispatches I am about to read, that, beginning about the 1st of May, I tried to get a promise from our Navy Department as to the cooperation of our Navy, which was essential to put this convoy system into effect whole-heartedly. Here I again met with the same experiences described above, in regard to requests for other forces.

Having been informed by the admiralty that they were about to try the convoy system, I sent the following cable to the department on the 30th of April:

Sent: April 30, 1917.
To: Secretary of the Navy, through State Department.

Admiralty making study of convoy system for shipping. Tentative plan proposes two general rendezvous American coast for assembly every four days all ships under 15 knots. Similar action Gibraltar and other trade routes. Escort one war vessel against raiders. Destroyers meet convoys at war zone. Two escort ships resting each end about eight days. Plan would require our furnishing some escort vessels and additional destroyers this side, and would necessitate abandonment present patrol against raiders. Not yet decided by admiralty. This advance information for department's consideration.

SIMS.

The day following my first dispatch I again cabled the Navy Department in the following dispatch:

Sent: May 1, 1917.
To: Secretary of the Navy.

British Admiralty has decided to give trial to the convoy scheme described in my last dispatch. Instead of present plan of naval forces operating independently against raiders, there will be a high-sea convoy against raiders, such convoy to be established as quickly as possible on all main trade routes, and on approach to dangerous areas

Digitized by Google

on this side will be met by destroyers and escorted into port. Hampton Roads and New York have been proposed as assembly ports for east bound vessels on our coast and Gulf, with convoys sailing every fourth day. Plan decided on after long consideration by admiralty and war council, and is considered absolutely necessary. It will strain British resources of personnel and ships to the limit and we must assist by taking one route, at least, if the plan is to be carried out. Admiralty desire to be informed whether we can provide escorts for convoys sailing from the rendezvous at New York. British estimate about 14 ships will be required for New York service, and larger numbers for other routes, including Mediterranean and South America. Escorts should have sustained sea speed of at least 12 knots and 6-inch guns. I very urgently recommend favorable action. Through British naval representative at Washington details of plan will be communicated from time to time as necessary.

SIMS.

At the same time the British naval officers who had accompanied Mr. Balfour on his trip to America, had endeavored to secure the approval of the Navy Department to the convoy plan. As I was informed by Admiral Jellicoe, a complete and definite proposal for convoying all Atlantic shipping was given to the Navy Department by these officers on the 5th of May.

I received no answer to the message I had sent on the 1st of May, and, in fact, no communication whatsoever from the Navy Department with regard to the convoy proposal until June 20, nearly two months later.

In the meantime I learned from the Admiralty, some time in May, that the Navy Department were formulating a plan of their own for handling shipping from American ports, and were building up an independent organization for the routing of American shipping. Realizing the importance of securing immediate action I cabled a request to the naval attaché in London while I was at Queenstown, at the end of May, to inquire of the department what action had been taken.

He cabled on May 25 as follows:

Sent: May 25, 1917.
To: Nav. Intel., Cl.

The principle of convoying merchant ships in accordance with general plan is approved by the Admiralty. The British would like to know if we could provide cruisers for all convoys leaving New York Harbor. They are willing to convoy all ships from Hampton Roads. Be so good as to reply to this cable.

MACDOUGALL.

No reply was received from the department.

On May 31 I again cabled, urging an early reply. This cable was as follows:

Sent: 31st May, 1917.
To: Secretary, Naval Operations, through State Department.

With reference my two previous dispatches concerning convoy system of handling merchant shipping. Scandinavian and North Sea convoys now in force over a month have proved very successful. First ocean convoy from Gibraltar arrived safely on May 20. Second ocean convoy from Hampton Roads of 12 merchant ships escorted by British cruiser sailed May 24. They will be met outside and escorted through submarine danger zone. The department's cooperation with the plan set forth in my dispatch of May 1 is urgently recommended. Early reply important in order that Admiralty plans may be governed accordingly.

SIMS.

In all the cables and letters which I have read to you heretofore, and which were sent at the end of May and throughout June, I continually emphasized the vital importance of adopting immediately the convoy system, in order to save enough shipping to make possible the continuation of the war.

Digitized by Google

In my letter of June 13 I outlined the method of handling convoys in the war zone, which was ultimately adopted by the department. This letter is long and technical, as it deals with the detailed methods of handling convoys, and I will therefore not read it, unless, of course, the committee desires it. read.

The CHAIRMAN. I think it would be well to put that letter in the record.

Admiral SIMS. Very well.

Letter No. 1.

OFFICE VICE ADMIRAL COMMANDING
U. S. DESTROYER FORCES, EUROPEAN WATERS,
London, June 13, 1917.

From: Vice Admiral William S. Sims.
To: The Secretary of the Navy (Operations).
Subject: Convoy operations in submarine danger zone.
Reference: Department's cable 21009.

1. With reference to the department's cablegram 21009, concerning methods of protecting future convoys of troops or supplies for our Army and Navy forces while in submarine danger zone.

2. The governing considerations in the question of escorting through the submarine zone are:

(1) Latest information concerning enemy activity.

(2) The question of not entirely abandoning our own offensive campaign in favor of escorting duty, and

(3) The question of the number of craft available for such duty and their disposition.

If, for example, enemy activity is concentrated to the westward of Ireland and convoys are coming in well to the southward of this area, it manifestly is important to concentrate our offensive campaign in the area in which the enemy can be most effectively attacked.

In deciding as to the number of types of ships to be diverted from offensive operations preference is always given, of course, to convoys carrying troops. Convoys carrying material, whether it be munitions, animals, or food supplies are escorted whenever necessary; but such escorting duty is not allowed materially to interfere with the offensive campaign in operation at the time in question.

3. In those areas which are constantly being covered by destroyers or other antisubmarine craft, such as sloops (specially built antisubmarine vessels, about 1,200 tons), the attempt is made to avoid taking such vessels out of their designated patrol squares. The vessel or vessels which first picks up a valuable cargo escort it through her square, notifying the patrol vessel on the next square inshore, and turning over to her as soon as the meeting of the ships is effected. If by reason of thick weather, etc., contact is not made, the convoying vessel continues on the next square.

4. The routes which will be followed by our troop and supply ships bound for France are, generally speaking, outside of the main areas of submarine activity, and hence outside of the areas continuously patroled by destroyers and other antisubmarine craft, except for a short distance off the west coast of France.

5. For the purpose of handling such convoys and also the merchant shipping convoys which are now in operation from Hampton Roads to the Mediterranean, the Admiralty have established, for convenience in their own administration, a comparatively large number of rendezvous well out to sea, and encircling the British Isles and west coast of France. Also a comparatively large number of locations on the Irish, English, and French coasts have been given designating figures or symbols. It will, therefore, be the practice each time that one of their convoys sails from a foreign port, to designate a rendezvous which they are to pass through and a point on the coast which they should steer for after passing through the rendezvous.

This requires a notification well in advance giving as closely as possible the time that convoys will pass through the rendezvous points designated. Escorting destroyers will then be able to intercept the convoys at some point on the route between the rendezvous and the point designed on the coast, the position of interception depending primarily upon enemy activities at the time. It manifestly must also be possible to communicate in cipher with convoys at sea and divert them from one rendezvous to another if occasion demands.

The above mentioned lettering and numbering of rendezvous and points on the coast are, as stated, primarily for convenience of reference in administration in the Admiralty itself.

Digitized by Google

The significance of such symbols if circulated even to our own allied officers abroad must necessarily be limited to the maximum extent in order to preclude any possibility of the enemy becoming aware of them.

6. If the greatest possible degree of safety for convoys is to be insured, it is entirely necessary that their movements should be under control of one source, and therefore as all enemy activity is concentrated on this side of the Atlantic and his main effort must necessarily remain in its present zone, it follows that selection of rendezvous routes and other directions in regard to movements of convoys should be controlled and directed from this side; that is, in the Admiralty itself. It is for this reason that the Admiralty has requested, and I strongly recommend, the immediate detail of a competent and tactful officer whose duties in the Admiralty under my general direction will be confined to those above indicated.

7. The following procedure in regard to convoys is therefore recommended:

(1) Early advance information regarding prospective sailing of convoys and their character.

(2) Immediate information as soon as definite hours of sailings can be foreseen.

As soon as this information is received, and after consultation with the Admiralty, a rendezvous and route to be included in sailing orders will be selected and given. Definite information should then be given when convoy sails, as to its prospective speed and time of passing through rendezvous designated.

8. It is urgently requested that only British Admiralty codes be used for such communications, addressed to the Admiralty, the first word of the message being "Sims."

9. Under no circumstances, if convoys are divided into groups, should these groups use the same rendezvous and the same routes after reaching the danger zone, as in such a case if the enemy should become aware of their movements he would be able to concentrate for successive attacks.

10. Ships of convoys should zigzag together from two to four points irregularly. Organized irregularity is one of the principal requirements in opposing submarine attack.

11. Escorting destroyers should be allowed the maximum independence of movement and the exercise of initiative. They should not be held to strict formations in reference to bearings and distances from the convoy. This procedure is necessary in order that full advantage may be taken of their experience in operating against submarines and their later information in regard to enemy methods, which are continually changing.

12. It is mandatory that the wireless should be used as little as possible. In fact, it would be better not to use it at all, except for important directions which may have to be sent from shore as to changes of routes. Evidence indicates that the enemy have been successful in the use of radio direction finders, particularly in locating large forces or radio work of an unusual or distinctive character.

13. It is apparent that once a convoy enters the danger zone an escorting cruiser is of little or no protection against submarines, and virtually becomes one of the convoy itself, also requiring protection.

14. Up to April 1 there is no evidence to indicate that any German submarine carried beam tubes, and this is one of the principal reasons why they have never attempted attacking a formation from ahead—that is, approaching from ahead and firing as they pass through the formation. With bow tubes they would be forced to use the helm before reaching the formation, with considerable danger to themselves, which they seldom if ever incur. Hence the principal arc for destroyer protection is the bows and wings of formations.

15. The two principal requirements of formations of a considerable number of ships for defensive purposes against submarines, are:

(1) Minimum depth of formation—that is, minimum length of formation in the direction of course. This in order to reduce the arcs on the bows and beams, which must be protected by destroyers.

(2) The second consideration is to concentrate the formation as much as possible—that is, it is also necessary to reduce the dimension of the formation at right angles to the course.

This not only reduces the range of visibility of the force, but also restricts the advantageous positions of attack which the submarine desires to attain.

It is for the above reasons that line of divisions formation is generally adopted, with the distance between columns as small as consistent with zigzagging evolutions.

I cite that merely to point out that, as in all other cases, I put forth my utmost endeavor to keep the department fully informed of all Allied war experience, and that, in the particular case under discus-

Digitized by Google

sion—that is, the convoy question, they had the fullest possible information of every phase of the problem.

In cables of June 14, 15, and 17, 1917, I repeated my recommendations with regard to convoy. My message of June 15 will probably convince you of the urgency of these recommendations:

Sent: June 15, 1917.
For: Secretary of the Navy.
From: Vice Admiral Sims.

No. 30. Strongly urge our putting convoy system into effect immediately from Philadelphia. Boston, New York, and North Atlantic ports as previously recommended. British propose to assemble Canadian convoys to join ours. Convoy system is an offensive measure. At present our fuel is being expended and machinery trained in seeking an enemy whose primary object must be to avoid action and attack merchant shipping. We are also necessarily attempting to combine escorting duty with independent offensive operations, escorting such individual ships as the situation combined with our limited number of vessels permit.

If shipping were grouped in convoys, we would thereby force the enemy to seek us, and thus impose upon him the necessity of dispersing his forces in order to locate us, while we obtained the benefits of the principle of concentrated attack upon his dispersed line. A study of the convoy system shows that, even if a few ships of each convoy were sunk, our losses would be much less than at present. The enemy has marked limitations, owing to his distance from bases, and limited ammunition and offensive power. It is manifest that the enemy can not afford to expend much effort against our antisubmarine craft. Experience indicates that submarines have not attempted concentrated attack in numbers, owing to difficulty of coordination and danger to themselves. Such attacks, if attempted, would facilitate offensive operations of escorting destroyers.

If diverted from attacks on shipping the objective of the enemy campaign is lost. Request that department consult with British commodore in charge of assembling convoys, Hampton Roads. If the plan proposed is to be adopted at all, it is mandatory that it be put into force without delay, and while the campaign is most severe. Request early information as to department's action. A convoy may be started at any time, the larger number of ships the better, escorted by cruiser or reserve battleship and preferably with naval officers and signalmen on each ship.

SIMS.

I began in the beginning of May, and it was not until the latter part of June that I got any reply whatever, and the last sentence of the reply was this:

"In regard to convoy, I consider that merchant vessels having armed guards are safer when sailing independently."

DANIELS.

I would have supposed that anyone who had even casually read the Sunday newspapers would have known that the arming of merchant vessels would have just the opposite result, as it obliges the submarine to torpedo without warning instead of sinking a ship with its own gunfire.

In my cable of June 20 I said, in substance: It will seem suicidal if the convoy system is not put into immediate operation and applied to all shipping, thus forcing submarines to encounter antisubmarine craft in order to attack shipping. It is impossible to carry on partial convoy and partial patrol system. Both can not be done, the former much better than present system, which is not succeeding. Urgently request information of department's action on this dispatch and upon previous similar dispatches. A decision is necessary before decisive action can be taken on this side.

I think I have explained further along that until a decision was made on the American side, it was extremely difficult for the people on the other side to put a convoy system into operation.

Digitized by Google

With regard to the arming of merchant ships, I replied to the Secretary's assertion in my dispatch of June 21. This was sent from Queenstown. [Reading:]

Cable sent June 21, 1917.

I trust I have made the critical nature of the military situation entirely clear. I consider it my duty to report that if we can not offer more immediate actual assistance, even to the extent of sending the majority of the vessels patrolling our own coast lines, which can not materially affect the general situation, we will fail to render the service to the allied cause which future history will show to have been necessary.

My recommendations concerning the convoy system were not based upon American vessels, but upon all allied shipping, for it is upon the preservation of the remainder of this shipping that our success against the enemy is entirely dependent. It is assumed here that the comparative immunity of American shipping from submarine attack is due to German hopes that such a policy will strengthen the peace propaganda in America. This is apparently clearly shown by the German press. Actual and extended experience has shown that arming merchantmen does not protect them from attack, but simply forces the submarine to attack without warning, thus obliging her to use up her torpedoes and shorten her cruise. Armed merchantmen are being sunk daily off this port.

That is, Queenstown.

The success of the convoys, so far brought in shows that the system will defeat the submarine campaign if applied generally and in time. The system merely is a plan that obliges the submarine to fight antisubmarine craft in order to attack merchantmen. The present campaign is not succeeding. The necessity is again presented of sending all destroyers, tugs, yachts, and other craft which can reach the critical area, by themselves or towed part way by reserve battleships or any naval vessels. If the situation is not made clear, I hope the department will indicate the further information desired. Time is a vital element in any measures taken.

SIMS.

Again, on June 22, I urgently advised the supply by the United States of necessary convoy escorts for the convoys from New York, and explained the arrangements made by the British: If anybody has had the curiosity to read Admiral von Tirpitz's book, he will see in there that everything I had to say or will have to say about the convoy system or the patrol system is entirely sustained by the opinion of that admiral. [Reading:]

To: Secretary of the Navy.
Sent: June 22.

The British Admiralty have now adopted the convoy system and will put it into full effect as fast as ships can be obtained for high sea convoy against raiders and destroyers for escort duty in submarine zone. As previously reported, convoys are in successful operation from Mediterranean and Hampton Roads. Plans are in hand for total of eight convoys a week as follows: Two from Gibraltar, two from Hampton Roads, two or three from New York, one from Canada—the latter preferably being combined with the New York convoys. One a week from New York will be put into operation as soon as possible with British cruisers, in absence of our support. I again urgently advise our full support, assisting and cooperating in assembly of convoys, and furnishing one cruiser or reserve battleship a week for high sea escort. Reserve battleships are admirably suited for this duty, which will not interfere with personnel training, for which I understand they are now being used.

In reply to these cables a message was received from the department on June 24, which has been previously read. [Reading:]

[Cablegram.]

From: Secretary of Navy.
To: Alusna, London.
For: Vice Admiral Sims, No. 37.
Received: June 24, 1917.

This is a reply to your various letters and cables.

Another thing that the department recognizes is the necessity of sending all antisubmarine craft which can be spared from the home waters into active European

Digitized by Google

waters, and when such craft become available will send them. In making the local assignments abroad of such forces, the department requests and will be guided by your advice, which should be given after consultation with the various admiralties concerned as to priority of requirements.

The department is strongly of the opinion—based on recent experiences—that the question of supplying adequate guns and trained gun crews to merchant ships is one which can in no wise be treated as a minor issue. Coupled with a rigid system of inspection, this method is believed to constitute one of the most effective defensive submarine measures.

That is exactly the same thing as was said in the cable from the Secretary of the Navy. There was the opinion formed in America, necessarily without the information that should have been considered in connection with it, which was holding up a convoy system, and which held up for two or three months, and which cost the loss of a number of hundreds of thousands of tons of shipping and some lives. [Continuing reading:]

It announces, moreover, as its policy, its willingness to cooperate in every way, and will consider the question of supplying additional naval forces of types other than antisubmarine craft whenever the advisability of so doing is justified. The department is also considering the outline of a scheme which it is hoped will allow of a greater degree of cooperation and ability to supply escort to vessels through the danger zone, without interfering with the destroyers' other duties as much as does the present system of individual escort, and it will not displace the present method of handling merchant shipping from United States ports. Details when prevented (perfected) (?) will be cabled.

DANIELS, *Secretary Navy.*

That is a scheme that is proposed in the last paragraph of that telegram, some royal road to victory scheme, which was never presented, so far as I know.

It will be noted that in this cable the department reiterates the opinion expressed by the Secretary, four days before, that the arming of merchant ships constituted one of the most effective defenses against submarine measures, and implying thereby that it merited more consideration than the convoy system, or, at least, that until it was further developed, it was unnecessary to take the convoy system very seriously. In any case it is difficult to construe these answers from the department, to my specific and urgent recommendations concerning the convoy system, as anything less than what they considered justifiable substitutes for the convoy system. The committee can perhaps imagine my state of mind when confronted with this situation. It was impossible for me, 3,000 miles away, assisted by only one commissioned officer, to know just what was in the department's mind. I could assume nothing less than that they failed to understand the issue which I had attempted to present. I, therefore, made one more attempt to put forth the case of the convoy system, in the following dispatch sent from Queenstown on June 28, to which I invite the committee's particular attention?

Sent: June 28, 1917.
To: Secretary of the Navy.
From: Queenstown.

Referring to department's opinion, reported in last two cables, to the effect that adequate armament and trained crews constitute one of the most effective defensive antisubmarine measures, I again submit with all possible stress the following, based on extended British war experience. The measures demanded, if enemy defeat in time is to be assured, are not defensive, but offensive-defensive. The merchantmen's inherent weakness is lack of speed and protection. Guns are no defense against torpedo attack without warning, which is necessarily the enemy method of attack against armed ships. In this area alone, during the last six weeks, 30 armed ships

Digitized by Google

were sunk by torpedoes without submarine being seen, although three of these were escorted each by a single destroyer. The result would have been, of course, the same no matter how many guns these ships carried or what their caliber. Three mystery ships, heavily armed, manned by expert naval crews, with much previous experience with submarine attack, have recently been torpedoed without warning. Another case within the month of mystery ship engaging submarine with gun fire at 6,000 yards, but submarine submerged and approached unseen and torpedoed ship at close range. The ineffectiveness of heaviest batteries against submarine attack is conclusively shown by Admiralty's practice always sending destroyers to escort their men-of-war.

The comparative immunity of the relatively small number American ships, especially liners, is believed here to be due to the enemy hopes that the pacifist movement will succeed. Cases are on record of submarines making successful gun attacks, from advantageous sun position, against armed ships, without ship being able to see submarine. I submit that, if submarine campaign is to be defeated, it must be by offensive measures. The enemy submarine mission must be destruction of shipping and avoidance of antisubmarine craft. Enemy submarines are now using, for their final approach, an auxiliary periscope less than 2 inches in diameter. This information just acquired. All of the experience in this submarine campaign to date demonstrates that it would be a seriously dangerous misapprehension to base our action on the assumption that any armament on merchantmen is any protection against submarines which are willing to use their torpedoes. The British have now definitely decided the adoption, to the maximum practicable extent, convoys from 16 to 20 ships. This is an offensive measure against submarines, as the latter will be subject to the attack of our antisubmarine craft whenever they come within torpedoing distance of convoyed merchantmen. Moreover, it permits of concentrated attack by our forces, and obliges the enemy to disperse his forces to cover the various routes of approach.

Concerning department's reference to a scheme for protection of merchant shipping, which will not interfere with present escort duties, I submit that the time element alone prevents utilization of any new antisubmarine invention. The campaign may easily be lost before any such schemes can come into effective operation. The enemy is certainly counting on maximum effort being exerted before long nights and bad weather of autumn, that is, in next three months. Heaviest effort may be anticipate in July and August. I again submit that protection of our coast lines and of allied shipping must necessarily be carried out in field of enemy activity if it is to be effective. The mission of the Allies must be to force submarines to give battle. Hence no operations in home waters should take precedence over, or be allowed to diminish, the maximum effort we can exert in area in which enemy is operating, and must continue to operate in order to succeed.

SIMS.

All of this time I was keeping in close touch with the opinion of the French navy department, and hence it came to my notice that the department was calling upon the French, by direct communication, for their opinion concerning the convoy system, and doing so without my knowledge. This was, of course, quite within the province of the department, but I mention the fact merely to show the confusing situation created by such methods.

The French reply, of which I here have a copy, shows their complete agreement with all that I had been recommending:

From: French naval general staff, first section, Paris.
Date: June 26, 1917.
To: French naval attaché, Washington.

[Translation.]

Replying to your telegram, at the request of Admiral Benson, we have considered, in concert with the British Admiralty, before the entrance of the United States into the war, the principle of the grouping in convoys of merchant ships across the Atlantic with protection by cruisers.

The cruisers are intended to protect the ships against pirates and the new large submarines. They shall conduct the convoys to the approach entries, where destroyers will assure the exscort to the port of discharge. Admiral Grasset has received instructions to make arrangements with the British admiral at the Bermudas, and have these cruisers perform escort duty.

Digitized by Google

We are quite ready to consider, in concert with the American Admiralty, a new distribution of the allied cruisers for the protection of merchant ships and transports. We will, moreover, communicate to Capt. Jackson all the information we possess on the matter.

Capt. Jackson was my representative in Paris.

It is unnecessary, I am sure, to point out to the committee how this message, which is but one of many similar incidents, demonstrates the wide gulf which existed between the methods the Navy Department pursued and that which we all understand by the phase unity of command.

The department in the meantime was apparently still working on their independent plan for the control and routing of shipping, of which I had learned accidentally in May.

On June 28 I cabled the department (in reply to a number of requests as to the control of American merchantmen), recommending that American efforts should be coordinated with those of the Allies in the control of this shipping. My message was as follows:

Sent: June 28, 1917.
To: Secretary of the Navy.
From: Queenstown.

Reference department's notification of sailings of American merchantmen. If same measure of protection is to be afforded American as other allied merchantmen, their movements should be handled in same manner. Therefore coordination with British shipping officer New York is necessary. Communications with London, and steps taken to establish routes and protection in dangerous zones, would be simplified, and safety better assured, if all communications were made in same codes and from same sources as for British and other allied shipping. Separate communications via naval attaché or me means confusion and are not safe. The essential information is character of cargo, times of sailings, times of arrival at the rendezvous, and call letters. It should be understood that there are not sufficient ships available in submarine zones for escort or other protection of even all specially valuable cargoes, not to mention so-called valuable and other cargoes.

SIMS.

No direct reply was received to my recommendation, but on July 1 the department outlined a complete plan of their own in the following cablegram:

Received: July 1, 1917.
To: Alusna.
From: Secretary of the Navy, Washington.

Sims' No. 42. Navy Department is inaugurating shipping intelligence offices under naval officers at customhouses in United States ports, where British admiralty now has similar offices. Navy Department desires to cooperate with British and other admiralties in shipping intelligence service along following lines. United States offices to furnish service in United States ports, British in British ports, French in French, Italian in Italian. Foreign assignments in United States offices welcome. Consuls in neutral countries to cooperate. Navy Department will keep cooperating admiralties fully informed of dangerous routes, rendezvous, and regulations, concerning vessels approaching United States ports, and will expect similar confidential information to be furnished from abroad. Routes rendezvous and convoys in danger areas will conform in all respects to directions of admiralties responsible for these areas. Consult admiralty and arrange details. Department will approve if above general principles adhered to. 19030.

DANIELS, *Secretary Navy.*

To this message I replied as follows:

Sent: July 3, 1917.
To: Secretary of the Navy.

No. 71, referring to your No. 42. In view of present critical stage of war, with probability of decisive developments in next few months, which will be entirely dependent upon preservation of shipping, I submit that it would be a fundamental military error to attempt in any way to change present established administration personnel, or methods of communication in connection with control of shipping.

Digitized by Google

Undoubtedly the most serious military handicap of this war, as of all allied wars, has been difficulty in coordination between allies. It would manifestly be the safest military policy to allow any one ally to control and direct all operations, but as this can not be done, we should certainly subordinate every interest possible to such an end. To attempt at this time to establish new shipping offices, with new personnel, introducing necessity for increased number and different methods of communication, would certainly involve delays, misunderstandings, and confusion which would be direct assistance to enemy.

If success is to be assured and accelerated, there should be no lines of distinction, or introduction of complication. The shipping to be controlled is all of the allied and neutral shipping, which should be treated as a whole. It needs protection only in field of enemy's campaign. We may, and should, assist by adding extra personnel to present established system of control, but under no circumstances should we attempt to supplant or take over any shipping offices now in efficient operation. I submit that central control for all shipping should be concentrated here in London, in center of war area, where all information of enemy methods is constantly available, and from whence daily control of naval forces should originate. British Admiralty has been consulted and is in complete agreement with this dispatch. It is impossible to adequately present this case by cable, and it is therefore hoped that department will accept these recommendations, based on one consideration only, namely, our interests in the one cause against common enemy.

SIMS.

I am going into this thing at some length because it is the most important measure that was taken during the war, and consequently the continuous resistance for a number of months to the introduction of that convoy system by the Navy Department is the most serious error that was committed.

For the information of the committee, I should perhaps very briefly explain what the point at issue here really is. The only routes followed by convoys which were vital and which involved great danger, were in the so-called submarine zone; that is, off the coasts of France, Great Britain, and Ireland. In this area not only were convoys confronted with the danger of submarine attack, but what in the minds at least of merchant captains was considered an even greater danger was that of collision with other convoys, as all ships were running without lights. It must be remembered that convoys were not only coming from Canada, New York, and Hampton Roads, but also from the Mediterranean and from South Africa—the latter being ships from Australia and other localities. To add to this congestion, we always had the outgoing convoys to consider. The routes followed by convoys outside of the submarine zone were, of course, not of particular consequence, as the amount of sea room there caused little fear of collisions.

It was for this simple reason, together with the fact that the latest information as to submarine whereabouts was available only in London, that it was essential—in fact absolutely necessary—that the routings and control of convoys in the submarine zone be handled from one source and not from many.

The plan proposed by the department, to suddenly displace the extensive system of offices which the Allies had built up in order to supply shipping with its routings, war warnings, and secret intelligence, was apparently based largely upon sentiment. I submit, without fear of contradiction, the assertion that no reason whatever, except that of increasing efficiency, could warrant, in the very height of a war of this nature—a period in which victory was doubtful and defeat quite possible—the throwing out of gear of an extensive organization which was working and upon which the safety of shipping depended. It must be noted, too, that this system, while

Digitized by Google

largely operated by the British, was an allied system for the protection of all allied shipping and had been prefected, and was in successful operation many months before the United States entered the war.

In spite of these recommendations, the fact remains that it was found necessary to keep the British offices going throughout the war, and that the department set up an independent duplicate organization in the principal ports of the United States, thereby wasting both officers and money. Many American officers who came abroad, including merchant captains, described the ridiculous procedure which they had to go through with in New York, traveling about the city from building to building to get their instructions.

I want to stress here the point that there is now no question as to the efficiency of the routing system then in force, because it is the identical system pursued throughout the war in handling all shipping whether single ships or convoys. In spite of this fact, however, the department seemed intent upon changing the plans, which could do nothing less than introduce confusion. For example, on July 2 I received the following message from the department, which I will read, together with my reply:

Cable received: July 2, 1917.
To: Alusna.
For: Vice Admiral Sims.
No. 44.

Referring to your previous cables. The following method for routing merchant ships across the Atlantic is suggested for discussion with the Admiralty. That the Admiralty predict for each week ahead, and nominate the days on which it will escort ships through danger zone. That Admiralty select rendezvous at which it will meet and escort merchant shipping. That their instructions be cabled to their agents here. That the United States authorities, working in connection with British agents here, from same office direct all belligerent shipping to rendezvous set by Admiralty, timing arrivals at rendezvous to fit dates predicted by Admiralty. That the make-up of convoy at the points of rendezvous be arranged for by classifying ships according to speed, the alphabetical classification to be plainly marked on the sides of the ship in place of a name. Or to adopt some other system of speed classification, if the alphabetical marking be too conspicuous to the enemy. That the United States authorities appoint rendezvous for incoming vessels to United States ports, in case the submarine efforts on this side render escort in these waters a necessity. It is believed this method has advantage of not slowing up the flow of merchant tonnage across the ocean, while, except for protection against raiders, it meets most of the requirements of continuous convoy. It has further advantage of making fewer demands on the Allies' coal supplies in European waters. 13001.

DANIELS.

My reply was sent the following day, July 3. [Reading:]

Sent: July 3, 1917.
To: Secretary of the Navy.

No. 72. Your 44 concerning convoy system. Have fully discussed with Admiralty the suggested modification of convoy system now in operation. The department's proposals have been subject of previous study and partial trial.

The disadvantages are as follows: First, great difficulty, and in fact impossibility, of efficiently assembling merchant convoys at distant rendezvous on the high seas. Even when convoys are assembled before departure, and are operating on definite prearranged schedule, the convoy's arrival at a rendezvous can not surely be predicted within from 30 to 40 hours. Second, the necessity for excessive amount of wireless communication on high seas in assembling convoys. This feature alone a vital objection. Third, difficulty of handling convoys information which have not had previous drill and experiments. The cruiser escort, in a addition to protection against raiders is very necessary as flagship of convoys, drilling them from day of departure in zigzagging and evolutions necessary if attacked. All merchants wireless codes are unsafe. It is therefore desirable that escorting cruisers should handle all communications in latest secret codes and that merchant ships should not use wireless at all.

Digitized by Google

It should be possible to divert convoys, if necessary, before escorting destroyers join.

This is now accomplished by broadcasting from Poldhu, on high power, to cruisers who don't reply, and in fact even beyond wireless sending range of cruisers. Four convoys from Hampton Roads have arrived safely 350,000 tons. Convoys are now being loaded and grouped according to European destination.

Not speed.

For instance, all cargoes bound for eastern British ports are grouped in one convoy. Convoys from Hampton Roads include cargoes from Chili, Panama, Gulf ports, Baltimore, and Philadelphia. Two convoys a week are now being started from Hampton Roads and one from Cape Breton, Canada.

In view of information available here, and present stage of development of convoy system, I strongly recommend that we cooperate to the maximum extent for some time at least. Can our escorting cruisers leave convoys outside of submarine zone and return without refueling? The plan is to escort outgoing empty ships clear of submarine zone and then disperse them. It is undesirable to add the cruisers to convoy in submarine zone, if it can be avoided. Admiralty desires information immediately as to whether first convoy can be started from New York on July 8. Again urgently recommend that carefully selected commander be sent immediately for duty under me in British Admiralty in connection with convoys. Admiralty particularly desires this.

SIMS.

The only explanation I can give—the only guess I can give—as to the proposal put forth in the cablegram, for the handling of the shipping, is that it was done by some one who had never been to sea or seen the sea.

In the cables and letters which I have been reading to you, it should be emphasized that, from the 1st of May, I had endeavored to convince the department of the necessity of assigning a sufficient number of cruisers for convoy escort duty to provide for the mercantile convoys from New York. On May 1, in my cable, I had estimated that 14 would be necessary for this duty. The first intimation I had from the department that they intended to take any action on this recommendation was on the 2d of July when, in its cable No. 44, the department stated that they would assign seven cruisers for convoy duty, in accordance with the Admiralty's request.

There was a delay from the 2d of May to the 1st of July, during which time they resisted helping out to the extent that they finally did in the convoy system.

This was confirmed by their dispatch of July 5, in which they stated that seven vessels of the *Denver* class would be detailed to assist in convoy operations. As I have previously pointed out, the Admiralty had been using the convoy system for six weeks, at the time when this first assurance from the department was received by me. As I had pointed out to the department in the letters and cables that I read you, it was practically impossible to attempt to handle commercial merchant shipping partially by convoys and partially by independent sailings, in view of the number of ships to be escorted, and the lack of antisubmarine craft.

It was absolutely necessary that so far as possible all important shipping should be immediately placed in convoy. Yet at this time, six weeks after the first convoy had successfully arrived, the British Admiralty had yet no information to the effect that the United States was willing to cooperate in this matter, and the cables I had received from the department indicated that they were considering many plans to avoid adopting the convoy system, but had not decided to cooperate fully with the Allies in convoys. Something of the distress and confusion resulting from this attitude of the depart-

Digitized by Google

ment may be inferred from the following letter, which I received from Admiral Jellicoe on the 11th of July. [Reading:]

I am very much disturbed about the convoy question. As you know, we are making great efforts to get it going, but it is quite impossible to organize the system unless we know absolutely what vessels are available as escorts through the submarine zone, and we can not know this unless the whole system of sailings from ports abroad to British and French waters is organized some way ahead, and by some way ahead I mean that we should know at least a fortnight before ships requiring escort leave ports on the other side, the reason being that convoys have to be arranged about three weeks ahead.

At the present time we have arranged four distinct convoys, namely, two from Hampton Roads every eight days, one from Canadian waters every eight days, and one from New York every eight days.

The first three of these convoys are escorted through the submarine zone by British sloops or destroyers, but we are absolutely dependent upon United States destroyers for the convoy coming from New York. Therefore, we must be certain of having 11 United States destroyers for this sole duty. Do you think you can guarantee that we shall have these destroyers, and that you can inform your Government that you have given the guaranty?

The next step that will be necessary will be to make it perfectly clear to the United States Navy Board that they must give a fortnight's notice before it is proposed to sail ships requiring escort in anything but the smallest numbers. We have, for instance, been informed within the last few days of troops being sent over in two White Star liners, of a hospital unit coming over in another vessel, and of four ships with valuable Government cargoes—all requiring escort; and we received the notice as the ships were sailing. As it happens, we also have troop convoys arriving at about the same time, and there will be the very greatest difficulty, I am sure, in providing adequate escorts for all these vessels, whereas, if a little notice were given, we could suggest the possibility of deferring the sailing of some of the ships, perhaps for a few days, so that escorts would be available when they arrived.

I think the matter is so important that I would suggest to you the desirability of wiring at once to say that it is essential that you should be given notice immediately of any proposed sailings within the next fortnight. Otherwise I fear that we may be faced with great difficulties. If we know that we are pretty clear for about a fortnight, we should be able to decide definitely whether the four destroyers could be taken for the service which I mentioned to you this morning.

J. R. JELLICO.

The service which he refers to there was a proposal to send four of our destroyers into the Channel for certain operations with British destroyers in the Dover patrol service. It was my opinion about that time that continuous service of our destroyers escorting and patrolling off Queenstown would get on their nerves, and it might be desirable to have some change, so that it was proposed to make an exchange, sending some of our destroyers into the channel in the Dover patrol, and let them be replaced by British destroyers, and in that way give our people, in succession, an opportunity to see some different service. But that is one of the things in which I was mistaken. They did not get stale on the job at all, all during the war.

During this period I had been receiving occasional announcements from the department of the sailings of Army supply ships and of British liners carrying American troops, all of which required escort. In most cases I was given only a few days' notice, and it became increasingly difficult to protect shipping and provide escort for these especially valuable ships. On the 12th of July I therefor sent the following dispatch:

Sent: July 12, 1917.

97. Very urgent.

It is of utmost importance that ample warning be given of prospective sailings of all ships requiring escort, and particularly groups of ships with troops or supplies which will approach European shores outside of usual merchant routes, similar to those re-

Digitized by Google

ported yesterday as having sailed on July 11. Every possible effort is now being made to put convoy system into full operation, and its success is dependent upon use of our destroyers in addition to British destroyers and patrol ships. At present there is prospect of severe congestion of convoys in submarine zones latter part this month, not only to United Kingdom, but also to France and from Russia.

Please cable to-day concerning any further prospective sailings of Army troops or supply ships before August 1. In case of such sailings, it will be necessary to cancel merchant convoy sailing from New York on July 14. Without advance notice of at least 15 days before sailings, there is grave danger of coincidence of arrivals in submarine zone, with necessity of inadequate protection for some convoy, and hence possibility of disaster. I again urge the importance of our not attempting to work independently, or of replacing present established British shipping and convoy officers, but that we solely cooperate in regard to all shipping, American as well as British and other allied shipping. Sailings of all British or American requiring special escort should be arranged in cooperation with British shipping officers, giving rendezvous and time. Communications should be made in accordance with their usual procedure, notifying me for information if desired. I recommend that, in future, Army supply ships join merchant convoys, in order to increase safety, relieve strain on limited number of escort vessels available, and permit plans to be made for adequate protection. This subject is of the utmost importance to allied success against enemy submarine campaign, and prevention of serious losses.

SIMS.

On the 11th of July I had received from the department a dispatch asking what steps were necessary in order to insure safe escort for troops and troop supplies. To this I replied in my message of July 14, again emphasizing the importance of coordinating troop and Army supply transports with the merchant convoys. This was as follows:

Sent: July 14, 1917.
To: Secretary of the Navy.

Unnumbered. It is impossible for me to guarantee safe escort protection through submarine zone for troops, troop supplies, and valuable Government cargoes unless the following conditions are fulfilled:

First. A schedule of prospective sailings, giving at least two weeks' warning in advance of all sailings.

Second. That such shipping be concentrated in convoys, even if delays are thereby caused.

There are not sufficient destroyers to meet demands imposed by irregular and independent sailings and insufficient warnings.

Sending troops by individual ships at brief intervals requires nearly double the number of destroyers that would be required if grouped in convoys.

All supply ships should sail with merchant convoys.

Third. It is essential to safety that my staff be increased, as previously requested. Without this assistance there is grave danger of mistakes which may indirectly cause serious losses.

I will take up especially, by and by, that question of the lack of assistance. In all the stuff I have been reading you since I came here, three days ago, I was assisted by only one man in my regular staff, and such assistance as I could get from outside, from the naval attache, and patriotic Americans who came in and worked for nothing.

The situation, as it then existed, was fully explained in my letter of July 14 to the Navy Department:

11. Convoys and valuable merchant shipping. The problem of insuring safe escort for merchant ships, either singly or in convoy, is a very complicated and serious one. Convoys are now coming from the Mediterranean, from Russia, and from various other places of origin besides America; and in view of the inadequate number of vessels available for escort duty, it is absolutely essential that this complicated and vital question of destroyer escort be coordinated in some central place.

The shipping to which I refer is not American shipping or British shipping, or any other allied or neutral shipping alone, but solely the combined allied and neutral valuable shipping which is essential to combined allied military and naval success.

Digitized by Google

I have not intended to convey in my dispatches the idea that I consider the British methods of handling shipping as the best. Improvements are doubtless possible, but we should not attempt to improve at the cost of lack of cooperation and hence at the cost of losses which can not be afforded.

My only aim has been to attempt to point out the entire necessity for thorough cooperation.

One of the greatest dangers in handling shipping arises from the necessity for long-distance communication and the danger of the enemy thus obtaining vital information.

In order to avoid these difficulties the principal requirement is to reduce the number of officers and personnel that must handle the work and to adopt and be guided by control from some one central source. There has been cause for serious concern over the proposal by the department to establish separate shipping offices and shipping office personnel. This would mean an extra system of communication, an enlarged number of people through whom information must pass, and hence would involve grave possibilities.

I would recommend with the greatest urgency that we first merely put such extra men as may be necessary in the British shipping offices to cooperate with them, and, as a beginning, that we use the systems and precedure and lines of communication which they use. From this beginning we could gradually introduce such modifications or improvements as are considered advisable, and perhaps in the course of time take over the work entirely in our own ports.

But it is of the utmost importance for the safety of shipping, and hence success against the enemy, that such a course should be adopted gradually, and that in any case we should always utilize the central control here in London, where all information is available and from where the orders should be issued to the escorting forces. The British Admiralty will be only too glad to accept a representative from our Navy Department, with his proportionate share of responsibility, in the Admiralty. This fact has been cabled in the past.

12. Very serious embarrassment has been experienced in the last few days owing to the unexpected announcements from the United States of the sailing of an Army transport convoy and of troops or hospital units on the *Mongolia* and the *Adriatic* and *Baltic* and other British liners. It happened that the prospective arrivals of these various ships coincided with the arrivals of merchant convoys from Russia, from the Mediterranean, from Hampton Roads, and from New York.

It was also not known definitely whether the ships referred to were the British ships *Adriatic* and *Baltic*. In the case of the *Mongolia* no rendezvous was given. As stated in my dispatches, advance information of at least two weeks is essential to properly coordinate plans. Without such advance information there is danger of coincidence of arrivals in the submarine zone and the possibility of being unable to supply proper escort to all. Such a course might easily result in disaster for some convoys or valuable individual ships.

So far the plans have contemplated United States destroyers escorting only United States Government troop and supply ships and the New York merchant convoys, in addition to their offensive patrol duties in Queenstown area, which includes escort of valuable cargoes sailing independently.

With but one military aid, there has been grave danger of oversights or errors in insuring proper action on all dispatches received. The responsibilities involved, and the far-reaching importance of the duties required, are considered to warrant an adequate staff, even at the sacrifice of other important demands upon the available service personnel. This subject has been explained in full in various cable dispatches and other reports.

All I can say about that is that God was good to us that we did not have some very serious losses, with all that confusion.

On the 6th of July, in accordance with the department's request, I sent over, by an armed guard officer, a full and detailed recommendation for the handling of troop convoys.

On July 22 I received a cable from the department, in which they stated that the rules for convoy, contained in this letter, were accepted, and would govern the department's action.

This plan, although it referred only to troop convoys, was, as a matter of fact, identical with the general plan for handling all convoys, in this respect, that it involved control of the convoy routings from a central source, and that source in London. As a matter of fact, in the specific case of troop convoys, their routings were handled

Digitized by Google

exclusively from my own office, but the officer who handled them was, of course, in the Admiralty convoy section daily, and was governed in his daily work by the merchant convoy system. This was absolutely essential. The two were interdependent.

I will refer to this question of handling troop convoys later, only adding at this time that the reason for holding the troop convoy routings strictly in my own organization was merely that of insuring greater secrecy in this all-important measure, upon which the safety of all of our troops fundamentally depended.

It was not until even later that, in the case of troop transport, the department finally accepted my recommendations as to the handling of Army and Navy supply ships. In the case of those ships sent abroad in July, so much confusion attended the plans for their sailing, and for their escort through the war zone, that it was apparent that the only way to handle them would be to sail them with the regular mercantile convoys that were being organized to sail weekly, or twice weekly, from New York and Hampton Roads. I could read you dozens of messages here, dealing with the confusion and embarrassment occasioned by sailing these ships independently, with no reference to other convoys; and in each case with the definite order from the department to me that I should, in each case, supply these ships, whether sailing singly or in groups, with danger-zone escort. What they wanted me to do in that respect was simply a physical impossibility.

In my cable of July 31, I therefore recommended that a definite policy be adopted for handling these supply ships. My message was as follows:

Sent: July 31.
To: Opnav, Washington.

No. 172. I strongly recommend that for all Government supply ships, Army or Navy, one of the following courses be pursued: First, that such ships be held and grouped in separate convoys of 12 or more, the sailings coordinated with other convoy sailings, or second, that as fast as such ships are ready they be consolidated with the merchant convoys from New York and Hampton Roads, which will be escorted through danger zone, and a detachment of destroyers will take over the escort to destination when convoy separates. Either of these plans will increase safety by permitting better concentration of protection, considering the inadequate number of destroyers available. Escort will be thereby greatly facilitated, with much less steaming and better state of readiness of destroyers.

The department on August 1 replied as follows:

SIMSADUS, *London.*

Opnav 73. Referring to your 172: This office concurs in expression of policy stated in your cable referring to the proper methods of routing cargo supply ships of the Army and Navy.

ADMIRAL BENSON.

You note the same experience; first, proposal of impracticable plans, a long discussion by cable, etc.; and a final acceptance of the simple, ordinary plans which had been suggested.

An excellent illustration of the attitude of the department toward convoy and shipping control at this time, is afforded by their message of August 10:

AUGUST 10, 1917.

Origin: Admiral Benson.
Vice Admiral SIMS, *London.*

Opnav 116. Your 197: The following is the situation in regard to American shipping. A few vessels route in the established convoys. More sail direct. Most ships confer with British shipping offices to get the latest information and routes. An

Digitized by Google

effort is being made to induce American ships to take advantage of the protection offered by convoy. It is not possible to compel this except in Government-owned or chartered ships until the Government takes over the control of all shipping. After studying your numerous cables on the subject, this office is of the opinion that what you want now is for it to furnish, after departure, names, dates of sailing, etc., of the following class of American ships only: Those American cargo ships sailing direct and not taking advantage of convoy. In the case of all ships carrying troops, and all Army and Navy cargo supply ships, you wish the information forwarded you.

Will act along these lines unless you instruct otherwise. All other reports of sailings, except War Department reports through you, will cease. 19008.

ADMIRAL BENSON.

This was, indeed, a most discouraging message. For at least four months I had been exhausting my vocabulary in attempting in both cables and letters to explain this convoy system. I feel sure it is unnecessary for me to go any further in explaining it to this committee, after having read the previous cables. For example, note the statement, at this late date, that a few vessels were being routed in established convoys; that most ships confer with British shipping offices to get the latest information and routes. Heaven knows, I had spent many hundreds of words in attempting to explain that this was exactly what they should do, as that was the only place where safe routes were obtainable. Note also the statement that, at this late date, "an effort" was being made to induce American ships to take advantage of the protection offered by convoys, and that it was not possible to compel them to do so.

It was plainly evident to the Allies, at this stage of the war, and it should have been evident to the Navy Department, that the problem confronting us was to save shipping, whether shipping wanted to be saved or not. It made no difference whether the shipping was privately owned or Government controlled; our fate was sealed up in it either way. It was the issue of the war at that moment. I had thought that the war had demonstrated that almost anything was possible. As for this small problem, any shipping man could undoubtedly suggest many means for its quick and radical solution. For example, imagine the effect on shipping if they had been told definitely that no protection whatever would be given them in the war zone if they did not accept Governmental instructions; or how simple it would have been to issue a Governmental warning which would have threatened the insurance on every ship lost.

This is, of course, what the Allies did. Sometimes I think that the people who handled that thing there did not know anything about ships or the sea, at all.

If there is any question as to the soundness of the various recommendations I have been explaining, I would invite attention to the last paragraph of this cable, which states that, as I had repeatedly recommended, all reports of sailings, except through one channel of information, would thereafter cease.

Before leaving the question of this convoy system, I wish to clear up a misunderstanding which seems to have gotten abroad, to the effect that I was more concerned with the safety of foreign shipping than I was for that of our own. What I was after was winning the war; and, as I have clearly shown above, during the period under discussion, this question was wholly bound up in the saving of shipping. It was not American shipping, or British shipping, or French and Italian shipping, but it was allied shipping. It was the vital shipping of the team which was lined up against the enemy.

Digitized by Google

As a matter of fact, United States shipping was a very small proportion of the whole in those critical days. For example, in July, 1917, there were a maximum of about 160 arrivals and departures per month, in the war zone, of American-owned ships. Consider this number against over 3,000 arrivals and departures of British vessels alone. Even such a comparison does not include the large number of British and French vessels which were necessarily moving in the war zone, practically all of their time, while our vessels were on the high seas a good share of their time, well clear of the submarine zone. The traffic up and down the French coast, carrying many supplies upon which the French armies were absolutely dependent, and our armies also, was never out of the war zone at all. I think it would be a safe estimate that, during those critical months, not more than 5 per cent of the arrivals and departures in the war zone were American ships.

I have before me figures showing that as late as 15 months after we entered the war, American shipping was less than 12 per cent of the total making up the allied lines of communication.

It is very difficult for me now to convey to you the atmosphere which existed at that time, and the real state of desperation in which I found myself almost daily, during those early months of the war. It should be noted that the cause of this was not a single matter, such as the failure to act upon my convoy recommendations, but that in a dozen different matters, at the same time, I was faced with the same situation, always hoping from day to day that the department would finally realize the situation, and either accept the recommendations, or send over somebody in whose judgment they could trust. And I again wish to reiterate that there is no question as to whether these recommendations were right. The fact remains that they were virtually all adopted by the department in the end.

I could read you, for the next week, copies of letters and cables sent by me in regard to the inauguration and control of the convoy system, but that would hardly contribute further to an understanding of this matter. I think that enough had been said to show that what I wrote in my letter of January 7, 1920, was a very mild statement of the serious embarrassements and delays and dangers in putting into effect the convoy system, which was the most important of all the measures used in defeating the submarine campaign against allied shipping. Paragraph 35 of letter is the one here under discussion.

NAVY DEPARTMENT MISCONCEIVED PROBLEM OF DEFENDING HOME COAST.

It became evident, in the early part of my mission abroad, that among the reasons which were keeping the department from a wholehearted and vigorous cooperation in the war was a misconception of the problem of the defense of our own home coast. As I have already pointed out, in a cable of June 24, the department had stated:

> Another thing the department recognizes is the necessity of sending all antisubmarine craft which can be spared from the home waters into active European waters, and when such craft become available will send them.

Digitized by Google

Similarly, in the department's cable of July 10, in which they outlined their policy, it was again specifically stated that the department's policy was:

First, the most hearty cooperation with the Allies to meet the present submarine situation in Europe or other waters compatible with an adequate defense of our own home waters.

From the time of my arrival abroad I had continuously pointed out, in numerous cables and letters, that full information was available in London concerning submarine movements. Throughout the whole of 1917 and the first few months of 1918 I informed the department continually that no submarine operations should be expected on the American coast, except as a possible diversion for political purposes. The reasons have already been fully described. I need only refer again to my first letter written on April 19. The whole situation was fully summed up therein, and all my numerous letters and cables thereafter were mere repetition.

I would like to particularly emphasize that fact, that in the very first letter I wrote, nine days after I arrived in London, the whole policy that I recommended throughout the war was contained in that letter, and after these long, trying periods of resistance by the department those things were all accepted.

In my first cable of April 14 I had said:

Cable to department, April 14, 1917:

It is very likely the enemy will make submarine mine-laying raids on our coast or in the Caribbean to divert attention and keep our forces from the critical area in the eastern Atlantic, through effect upon public opinion. The difficulty of maintaining submarine bases and the focusing of shipping on this side will restrict such operations to minor importance, although they should be effectively opposed principally by keeping the channels swept on soundings. Enemy submarine mines have been anchored as deep as 90 fathoms, but majority at not over 50 fathoms. Mines do not rise from the bottom to set depth until from 24 to 48 hours after they have been laid.

So far all experience shows that submarines never lay mines out of sight of landmarks or lights on account of the danger to themselves if location is not known. Maximum augmentation merchant tonnage and antisubmarine work where most effective constitute the paramount immediate necessity.

And in the letter of April 19 I explained why the submarines could not profitably operate on the American coast:

Letter to department, April 19, 1917:

11. The evidence is conclusive that, regardless of any enemy diversions, such as raids on our coast or elsewhere, the critical area, in which the war's decision will be made, is in the eastern Atlantic at the focus of all lines of communications.

The known number of enemy submarines and their rate of construction, allowing liberal factors for errors of information, renders it inevitable that the main submarine effort must continue to be concentrated in the above critical area.

It will be unnecessary to take up your time by reading many similar dispatches or letters. It should be borne in mind, however, that at least weekly and usually more often during those first six months, this same information, or these same recommendations, were being made. Thus, on June 20, in my letter report I stated:

Letter to department, June 20, 1917:

8. As reported by cable dispatch, it would seem that the maximum protection we can give our own coast should be concentrated in the area in which the enemy is operating and must continue to operate or fail.

It is quite possible, and in fact it has been a source of surprise that it has not occurred to date, that the enemy will send one, or perhaps two or three submarines to operate on our coast for a brief period, for the mere purpose of agitating public opinion and influencing us to hold forces in home waters. All evidence indicates clearly, however, that such a course would be primarily a diversion and a temporary one.

Digitized by Google

From cable to department, June 28, 1914:

I again submit that protection of our coast lines and of allied shipping must necessarily be carried out in field of enemy activity, if it is to be effective. The mission of the Allies must be to force submarines to give battle. Hence, no operations in home waters should take precedence over, or be allowed to diminish, the maximum effort we can exert in area in which enemy is operating, and must continue to operate in order to succeed.

Letter, June 29, 1917:

I again submit that, if the allied campaign is to be viewed as a whole, there is no necessity for any high-sea protection on our own coast. The submarine as a type of war vessel possesses no unusual characteristics different than those of other naval craft, with the single exception of its ability to submerge for a limited time. The difficulty of maintaining distant bases is the same for the submarine as it is for other craft. As long as we maintain control of the sea, as far as surface craft are concerned, there can be no fear of the enemy establishing submarine bases in the Western Hemisphere.

It should not be considered that I overlooked or minimized the importance of the defense of home waters, but, as I clearly pointed out, such defense in the first year, if not throughout the war, was best carried out in the submarine zone, where the major activities of the enemy were concentrated. It is an old and time-worn military principle that the best defense is a vigorous offense. This is as applicable to dog fights and street brawls as to military operations. There was every reason to believe, and events proved the case, that the only submarine operations which might occur on our coast would be sporadic and intended, as repeatedly stated in cables, merely as diversions which, if met with anything in excess of the minimum force required, would merely play into the hands of the enemy and accomplish the very enemy object of such diversions. In fact, from 1917 on, I submitted to the department suggestions and recommendations as to the best means of meeting such activity as might actually occur.

Actual experience had shown that we could depend upon being able to keep reasonably accurate track of all submarines at sea.

Incidentally, while not so important, that is one of the most interesting incidents that happened during the war—the extraordinary efficiency of the allied secret service. We hardly ever lost track of a submarine; and you will see presently we never failed to give adequate warning of when they left, when they would arrive here, and what they would do after they got here.

I do not mean here to convey that we knew where they were with sufficient accuracy to go out and sink them, but merely that we could at all times keep general track of comparatively restricted areas which they were occupying from time to time. Apart from secret service information, intercepted radio, and plotting by radio bearings, it is evident that the submarine could not accomplish any work at all without disclosing his presence; for example, if he sank a ship here [indicating] or if he were sighted there, knowing his average speed and having followed his operations previously, we could draw circles on the chart and be assured that for various periods he would be somewhere within those circles. This means that as long as the submarines were not too numerous in any one area, and as long as that area did not have to be traversed by ships, we could provide for safety by routing the ships around the circles. As a matter of fact, I am certain that history will show, when all the facts

Digitized by Google

are known, that more shipping was saved through thus keeping track of submarines and routing ships clear of them than by any other single measure. That was the constant work of the staff at the headquarters in London throughout the war. As stated elsewhere in this testimony, every route, every course followed by every American ship, naval, merchant, or troop carrier, was furnished by the staff, and all diversions of routings made while the ships were in the war zone were likewise directed and controlled by the staff.

The point, however, that I wish to bring out here is that, as we were certain that we would never have to deal with but one or two submarines at a time on our own coast, it was possible to do a great deal toward providing for the safety of shipping in our home waters without the use of any antisubmarine craft at all.

SAFETY OF SHIPPING IN AMERICAN WATERS WAS GIVEN CONSTANT CONSIDERATION.

That the safety of shipping in our own home waters was always on my mind, and that I gave it full consideration in all the recommendations made, could be easily substantiated by a long series of messages, which I might quote.

To take but one example, I discovered about the 1st of September, 1917, some five months after we had entered the war, that apparently little had been done in the way of establishing and controlling a routing system in our own home waters. This information was volunteered to me by many officers coming abroad, and also by merchant captains who visited our headquarters. I shall read extracts from an official letter sent to the department under date of September 4, 1917. [Reading:]

SEPTEMBER 4, 1917.

From: Force Commander.
To: Secretary of the Navy (Operations).
Subject: Approach routes to Atlantic coast ports.

1. It is not at all inconceivable that German submarines may operate off the main harbors of America or the Panama Canal. In addition to torpedoing ships, they might make it very embarrassing by planting mines in localties not far from our principal harbors. If mines were discovered off any of our harbors, there would result perhaps an immediate closing of the ports, and allied ships bound from Europe for America would be in immediate need of information as to how to be routed to American ports to avoid danger.

2. If the subject has not already been taken up, I recommend that the department be prepared to meet this submarine situation by having lines of approach prescribed for different harbors, and by having well defined channels of entrance that will be maintained by constant sweeping, if necessary.

3. In the allied shipping office, in New York, full information, with charts, etc., can be obtained on how the situation is handled in European waters.

4. There is no doubt that submarines can not operate advantageously on our Atlantic seaboard or remain there for any great length of time, but it is quite possible that a diversion might occur, and this office would be immediately flooded with inquiries from the allied admiralties as to what instructions they should give their ships in order to permit them to enter American ports without danger.

It was, of course, in the German interest to create abroad the impression that they were about to undertake submarine attacks upon the American coast, and it is to be noted that such rumors were continually circulated by German agents in Europe and in America for the purpose of influencing the Navy Department and to retain craft on the American side. This enemy policy was very sound, and was pursued by them in other fields throughout the war.

Digitized by Google

For example, the bombardments of a port in Liberia by an enemy submarine had no bearing whatever upon the outcome of the war, except in so far as the Allies allowed it to cause them to disperse some of their forces from the central strategical area where the enemy was trying to win. Throughout the war there were sporadic cruises by enemy submarines in the vicinity of the Azores and elsewhere far afield all for this same purpose.

The fact that such propaganda was not without effect upon the Navy Department was illustrated by the fact that I received numerous cables throughout 1917 and the early months of 1918 from the department mentioning these reports of probable submarine activities on the Atlantic coast. In my letter of October 9, 1917, I referred to this enemy propaganda and again repeated my recommendations, as follows:

REPORTS OF SUBMARINE ACTIVITY IN WESTERN ATLANTIC.

Letter No. 1254; October 9 1917:

With reference to the information which has reached the department recently from various sources concerning the possibility of a force of large enemy submarines operating off the Atlantic coast or in the West Indies, the force commander's dispatches have given practically all information available here. The force commander is strongly of the personal opinion that no extensive oversea campaign of this nature will be initiated by the enemy. He is further of the personal opinion that such a campaign is a practical impossibility.

No evidence gathered during the war indicates that enemy submarines are any more free from material casualties and the general restrictions which obtain with respect to surface craft than surface craft themselves; in fact, it is considered that submarines are much more restricted in their operations than surface craft. They require frequent docking, and hence it is not believed that even an efficient parent ship—should such a ship be available and if it were possible to maintain her in distant fields—would be able to furnish the facilities that the submarines on such duty would demand.

It is always, of course, quite possible that the enemy may send a small number of submarines to operate temporarily on our coast or in distant fields, with the object of affecting the disposition of our forces. It would be greatly to the interest of the enemy to force the removal of our antisubmarine force from the critical areas; that is, near to the enemy bases and in the local areas of allied trade, upon which the war is largely dependent.

It has been a source of more or less surprise that such an operation as this has not been undertaken before, and the only theory offered to explain the fact that it has not been undertaken has been that the enemy apparently did not consider it to their interest to arouse the American public unnecessarily.

It has been believed that the enemy hopes that peace will arrive before the military pressure of the United States has become at all serious. The population of the allied countries, now in the fourth year of the war, has reached what might be called a "bitter stage," which will react upon the enemy following the war during the reconstruction period. The theory is therefore advanced that it will be greatly to the enemy's advantage during the reconstruction period if the American public at large has not been given any cause to reach the so-called "bitter stage."

On the other hand, it may be urged that a few submarines sent to operate temporarily on the American coast, or on the trade routes from South America, particularly in the vicinity of the canal, might result in sufficient popular agitation to force the department into withdrawing either all or part of its forces from European waters. The possibility of this contingency must therefore, of course, receive serious consideration.

The fact was that the enemy was about as short of submarines for accomplishing his purpose as we were of craft for thwarting it. It was for this reason that we always were perfectly safe in assuming that these various far-flung operations, aimed at leading us to disperse our forces, could never be performed except by one or two submarines—this for the simple reason that, if at any time they had

Digitized by Google

taken too many submarines out of the only area in which they could win, the submarine campaign would then have ceased immediately to be a critical issue

As in so many other cases of recommendations made from the beginning, the department, after some months, recognized the soundness of the policy by adopting it. (I do not know that that is very largely so, either.) And I think I am safe in saying that by about November 1, 1917, it was their well-established and adopted policy to send everything they could into European waters; but during the early months this policy had not been followed, and many vessels had been kept in Atlantic home waters which would have been extremely useful abroad; and these vessels at the same time had been kept cruising, and hence, when the policy was finally adopted they were not ready to move which involved further delay.

The fact that the necessity for complying with the recommendations for sending the maximum number of craft into the war zone was fully recognized at this time at home, is shown in a report of a board convened by the Secretary of the Navy, in February, 1918, to draw up plans for the defense of home waters, and whose conclusions, I understand, were accepted by the department.

In the report of this board, under the heading "General policy," it was stated:

> The general policy of the United States is to send the maximum possible force abroad for offensive operation in the active theater of the war. This policy the board has kept constantly in mind, to the end that there might be no weakening of it.

The board recommended, as a means of defending shipping on the American coast, the establishment of shipping control and of approach routes to the Atlantic ports, which should be put into effect in the event of submarines operating off Atlantic harbors. It should be noted that these recommendations of the board, which are too long to be read here, was substantially of the same character as those recommended in my letter of September 4, which I have already read to you. This plan was to be supplemented by various auxiliary devices, such as mines and aircraft patrols. The board decided that 9 destroyers and 12 submarines would be sufficient craft to keep on the home coast at all times, and they found that it would be possible to maintain this force "by utilizing new destroyers and new submarines during the shakedown periods before departure for European waters." It had been found by experience that all these new craft developed many defects in the early part of their cruise and had to spend time in the navy yards. It is very significant in this connection that the board decided that these craft would be considered as available as long as they were on the coast and while going through their shaking-down period, which would involve periods under repair and overhaul at the navy yards. A member of the board stated that they were governed in this decision by my numerous reports to the effect that advance warning of the approach of submarines could always be depended upon. They considered that all of the destroyers recommended, whether under repairs at the yard or not, would always have ample time to throw things together and get out in case submarines were expected.

In a cable of April 11, 1918, to the Navy Department I again referred to the areas in which submarines might operate, and indicated measures to be taken to meet possible operations on the

Digitized by Google

American coast. In my letter of April 30, 1918 (No. 16406), I amplified the information contained in this cable.

This is what I referred to as the interesting movement of submarines.

INFORMATION OF MOVEMENTS OF ENEMY SUBMARINES.

The best proof of the fact that I had available at all times information concerning submarine movements sufficiently accurate for me to warn the department in advance of submarine movements toward the American coast is well demonstrated by what actually happened when submarines did arrive off the American coast in the summer of 1918. In my cable of April 28, 1917, I had said:

April 28, 1917.
To: Secretary of the Navy.
Through: State Department.

With regard to submarines entering and leaving their bases and their approximate whereabouts while operating, the Admiralty is able to maintain information that is fairly exact.

Of the 34 mine U-boats, 2 for some days were not located, and the Admiralty was on the point of informing us of the probability of their being en route to the United States when their whereabouts were discovered. It is the Admiralty's belief now that at present none are likely to be sent over and that the present effort of the submarines, which is successful, will be kept up off the channel entrance.

And these assurances I repeated many times in letters and cables before I cabled the information that a German submarine was en route for the United States coast, fully a year later. At the end of April, 1918, I learned that one of the submarines of the Deutschland type (U–151) had left Germany prepared for a long cruise, and that information indicated that her destination was the American coast.

The department was promptly informed, and further received numerous messages during the slow progress of this submarine, via the Azores region across the Atlantic. As I have repeatedly stated elsewhere in this testimony the department was not only given advance warning of the sailings of all submarines for our home waters, but further was given follow-up and confirmatory information, together with details, as regards the character of the submarines, their habits and methods, and even in many cases the names of their captains, with their previous records. I have before me a rather large batch of messages, all of this nature, which I will not take time to read, but I am sure that the committee would find them very interesting, and further that they would prove rather astonishing, because of the remarkably accurate and detailed information we had of enemy movements.

I will read complete or in part one group of messages concerning this first submarine, merely as typical messages.

[Dispatch sent 16-15-26. EJ134.]

Date May 1, 1918.
To Opnav.
Prepared by CS. Approved NCT. Code 34 ADR. No. 7289.
Highly secret. To Department May 1.

7289. Admiralty informs me that information from reliable agents states that a submarine of *Deutschland* type left Germany about April 19 to attack either American troop transports or ships carrying material from the States.

Digitized by Google

So far as known the German formed conclusions that:

First. Troop transports sail from New York via Nantucket Shoals and Sable Island direct to Europe.

Second. Material transports go from Newport News to a point south of Bermuda and then to Azores and thence to destination.

I might state incidentally there that while a great deal of this information was wrong, I am trying to bring out the point that the information that the captains of German submarines did have we got. [Continuing reading:]

It is thought that the submarine is taking a northern route across Atlantic, average speed 5 knots.

Note the "5 knots." It is important in this connection now, as we could give the information as to the starting of the submarine from the other side, there was plenty of time to send all the destroyers necessary, and put them in dock, and paint their bottoms, and put them over again before the submarine got over there. [Reading:]

None of new class of cruising submarines ready for service.

That is a new, large class of submarine, similar to the *Deutschland* that they were constructing for military purposes.

Admiralty experience with Deutschland class establishes following conclusions:

They generally operate a long distance from shore, and seldom in less than 100 fathoms.

Their single hulls are very vulnerable to depth charge attack.

They rarely attack submerged.

There is but one known instance of attack against convoy, and but two of torpedo attack against single vessels, one being unsuccessful. They attack by gun fire almost exclusively.

The most effective type to oppose them is the submarine.

They shift their operating area as soon as presence of submarine is discovered.

Admiralty requests Admiral Grant be given copy of this cablegram. 26001.

SIMS.

Admiral Grant is the admiral in command in America, here. [Reading:]

[Dispatch sent 16-15-26. J13.]

Date: May 15, 1918.
To: Opnav.
Prepared by CS. Approved Code B4Ar. No. 7997.
Secret. To department May 15.

7997 my 7829. Information contained in this cable is given me by the British Admiralty, and is necessarily somewhat paraphrased for transmission, but I have every reason to believe it is authentic. There appears to be a reasonable probability that the submarine in question (referred to in cablegram just read) may arrive off the United States coast at any time after May 20, and that she will carry mines.

As a matter of fact, we had exact information as to what she was going to do, but paraphrased it in the cable, and did not give it, for fear somebody might get hold of it. [Continuing reading:]

English experience indicates the favorite spot for laying mines to be the position in which merchant ships stop to pick up pilots. For instance, for Delaware Bay, the pilots for large ships are picked up south of the Five Fathom Bank Light Vessel. This, in our opinion, is one of the most likely spots for a submarine to lay mines.

As a matter of fact, we had the exact information that that was where she was going to lay mines, but, for the reasons given, we did not want to say so. [Continuing reading:]

As regards information possessed by Germans on subject of antisubmarine patrol. They have from various neutral sources information that a patrol is maintained off

Digitized by Google

most of the harbors, and especially off Chesapeake Bay. A neutral has reported that the patrol extends as far as Cape Skerry. (*sic.*)

It should be noted that, except for mine laying, submarines of this class always work in deep water, and that the Germans have laid mines in water in depths up to 70 fathoms. So far as is known, there is no reason why they should not lay mines in depths up to 90 fathoms.

The foregoing completes the information furnished by British Admiralty. The following is added by me.

There are circumstances which I can not explain more fully, which render it highly important that nothing whatever should be given out which would lead the enemy even to surmise that we had had any advance information concerning this submarine, even in the event of our sinking her, and that such measures as are taken by the department be taken secretly as possible, and without public disclosure of the specific reasons.

It seems, as I remember, that the department was criticised for not letting the public know that the submarine was coming over and was about to arrive, but it was absolutely essential that they should not give that information out. [Continuing reading:]

I venture to remind the department in this connection that the employment of surface vessels to patrol against this submarine would probably result, at best, in merely driving her from one area to another, whereas the employment of submarines against her might lead to her destruction. It is suggested that, having estimated her most probable areas of operation, submarines be employed in a patrol as nearly stationary as may be, some of them covering the point south of Five Fathom Bank Light Vessels, remaining submerged during the day with periscopes only showing. Of five submarines certainly destroyed in four days, three were torpedoed by British submarines. 7997. 22215.

SIMS.

[Continuing reading:]

I may say that the indications given in that cablegram as to where she would probably lay mines turned out to be entirely accurate. She did lay mines there, and those mines were responsible for the loss of the steamship *Pratt*, sunk at the entrance to the Delaware Breakwater, and also the steamship *Scapia*, and also the United States ship *Minnesota* struck a mine there, but did not sink. [Continuing reading:]

[Confidential.]

From: Department, June 4.
Simsadus.

6800. Enemy submarine commenced operation 60 miles southeast Barnegat, 2 June, 3 p. m.; sunk by bomb schooner *Edward H. Cole;* sunk by method not yet known; Jacob Haskell; U. S. S. *Preble*, reports now engaging submarine. Captain of *Cole* reports sighting periscope of second submarine.

BENSON.

That is the message of the department to me. I replied as follows:

[Confidential.]

To: Department, June 4.

9029. Your 6800. It is practically certain that there is but one submarine on Atlantic coast of United States, which is probably *U-151*. 9029.

SIMS.

I did not want to say that it was entirely certain, because we had to paraphrase those things. Then here is a cablegram received from the Navy Department, June 5, 1918. [Reading:]

SIMSADUS.

6852. Enemy submarine operating this coast, identified as *U-151*, has crew of about 75, commanding officer formerly employed Hamburg-American Line, has been off this coast. About 22 May, mine located off Overfalls Lightship; presence of more than one submarine not definitely established.

BENSON.

Digitized by Google

It will be noted that I not only gave information that the submarine had left its port on the 19th of April to go to the American coast but that I had given the probable area in which the submarine would operate off the American coast; and these were the areas in she did operate. It is to be noted also that this submarine began its operations on June 2, 32 days after I had informed the Navy Department of the exact area and of the approximate time, as reported. In other cables as quoted I gave additional information concerning this submarine, and the areas in which it would operate.

On June 6, I sent them a full description of this submarine, in answer to a request from the department, giving even the name of the commander. I believe at this time the American public was convinced a whole fleet of submarines, or certainly more than one, was operating on our coast.

I advised the department in advance of prospective movements of other submarines which operated on the American coast. Thus, in messages of June 29, and July 5, 1918, I informed the department:

JUNE 29, 1918.

[Highly secret.]

357. Second cruiser submarine at sea. At present off west coast of Ireland. Her field of operations not yet known. Can not reach longitude of Nantucket before July 15. Shall keep department informed.

SIMS.

---

655. Our 357. Enemy cruiser submarine outward bound, reported July 4 about 45 N. 30 W., proceeding southwesterly.

SIMS.

And I followed these messages by numerous other dispatches which gave them reasonably accurate information of her progress across the Atlantic. On July 6 I informed the department that a third cruiser submarine was at sea, probably proceeding to the American coast. And this information was also confirmed in a series of messages. On July 21 I informed the department that precautions should be taken against probable bombardments of certain points, which I named, along the Atlantic coast. This was in my dispatch 1543, and similar information was given in cables of a later date. In a cable of August 1, 2188, I reported that a fourth submarine, one of the mine-laying type, was on its way to the Atlantic coast. None of these submarines began operating until at least three weeks after the time of my first dispatch concerning them. I have before me here a large pack of messages which are but a few samples of the information concerning enemy operations on our own coast, with which I supplied the department at all times.

In this connection let me read you a couple of paragraphs from a letter which I wrote to Admiral Benson on May 17, 1918, summing up my whole attitude in this matter:

MAY 17, 1918.

To: Benson.

To refer again to the question of enemy submarines—which is never absent from my mind—I want to make it quite clear that it very rarely happens that the position of each submarine that comes out from the German base is not known, almost from day to day. This information is ascertained by cross wireless bearings and other means, but it is a fact that the exit and entry of each submarine is known, and that

Digitized by Google

her track is known with sufficient accuracy from the time she leaves port until she gets back.

I tell you this so that you may have no apprehension that you will not receive warning of the approach of any submarines that may start for America. I think you will always be safe in assuming that there are no submarines there that you have not been warned about. I have no idea at all that Germany will do more than she is now doing; that is, send an isolated submarine to the other side for the effect which they believe it will have on our people. To put the extreme case, if she should send all of her submarines to the other side, the antisubmarine campaign would at once be successful.

(At this point at 12 o'clock m., the subcommittee adjourned until to-morrow, Saturday, March 13, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

SATURDAY, MARCH 13, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met purusant to adjournment at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman) and Trammell.

The CHAIRMAN. The committee will be in order and Admiral Sims will proceed.

STATEMENT OF ADMIRAL WILLIAM S. SIMS—Resumed.

Admiral SIMS. The largest number of submarines that ever operated at any one time on the coast of the United States was three, and generally there was only one. This was in entire accordance with what was to be expected, and I mention it merely to show what a simple matter it was to meet such operations. Quite apart from any definite offensive taken against them, it was a comparatively easy matter to route our important shipping clear to them. Their position could be kept track of from day to day. We were bound to have some losses from them, but that was merely part of our share in the campaign. These losses were not serious in the aggregate and they had no influence whatever upon the outcome of the campaign, except in so far as they influenced the department to hold forces back from the strategical center of operations. The Secretary of the Navy, in his annual report for 1918, stated:

> On the whole, the operations of the German submarines against our coast can be spoken of as one of the minor incidents of the war.

I will not take up the subject of the department's lack of information concerning the department's activities and imperfect coordination with the Allies.

In the evidence thus far submitted, I have pointed out specific cases in which the department either disregarded my recommendations or delayed greatly in acting upon them. The recommendations to which I refer, it must at all times be remembered, were all based upon consultation and complete discussion with allied leaders, in accordance with the basic instructions under which my duties were performed abroad.

I will now turn to the subject discussed in paragraphs 60 to 66 of my letter of January 7, 1920. In these paragraphs it was pointed out that I was left in ignorance of many of the departmental plans, of many of the important dispositions and movements of forces in the area of my command—as well as elsewhere—and of delays and confusion which were caused by the department failing to use me

Digitized by Google

for the purpose for which they had sent me abroad, and attempting to carry on independent similar negotiations with local representatives of the European navies in Washington; also the embarrassment which these conditions caused me, through the impression naturally created in the minds of allied naval authorities that I was not being supported and was not in the confidence of the department. It might be pointed out that the different allied navy departments were in a measure responsible for these difficulties, because they continued at times to use these independent methods of negotiations; that is, through their local representatives in Washington.

Undoubtedly, at times, such independent negotiations resulted in direct conflict with my recommendations. It must be remembered that my recommendations did not forward merely the exact propositions of the allied admiralties, but they embodied as well my conclusions as the representative of the department, following discussions with the allied leaders. My first loyalty was always to the cause as a whole, but second was my direct loyalty to my own department at home. My mission was not merely to transmit the propositions of the allied leaders. It was up to me to act in every sense of the word as the representative of the Navy Department, and, after having the essential benefit of conferences with the allied leaders, to give the department the results thereof, together with my own recommendations based on all available information and upon the policies of my own service. It will be found, throughout my dispatches, that, wherever I was giving verbatim recommendations of allied leaders, it was so stated.

One of the great difficulties of this war, as of all other allied wars, was found to be that of securing effective cooperation among the forces of the Allies—the difficulty of getting team work out of a team made up of different nations—the difficulty of different nations subordinating many of their own national interests to a common end.

As a matter of fact, in the particular case here under discussion, the Allies carried on negotiations with our Navy Department, through their Washington representatives, partly because they found me in ignorance of plans and intentions concerning which their Washington representatives had already informed them. They also found that the department was apparently ready to deal with these local representatives.

It is little wonder that much confusion was created in the department through numerous requests and recommendations coming in from the different Allies. The grave danger of such procedure was that allied team work would be weakened and American interests suffer.

I want to stress here, however, that because other Navy departments made errors is no reason whatever for our having done the same. This is one of the principal objects I had in view in submitting my letter to the department—to invite attention to such mistakes in order that they might be avoided in the future.

It seems to me that no explanation is required to demonstrate the soundness of the proposition that, from our standpoint at least, all of this confusion and delay and misunderstanding could have been avoided by the simple process of referring all of the requests and recommendations, which came from various European sources, to the department's own representative abroad. He was in a position

Digitized by Google

to bring the matter before the responsible allied naval leaders—and after the formation of the allied naval council, before that body—for a full discussion in all its phases, in the light of the fullest and latest information, and to cable the result to the Navy Department for its guidance. This procedure insured, so far as was humanly possible, that due consideration would be given to the cause of the Allies as a whole, rather than to the often conflicting interests of the individual countries concerned.

It was natural for the Italian Navy Department and the French Navy Department, and the British Admiralty, to continue to communicate with their attaches in Washington, as they had done during the previous three years of the war. In fact, a great many such communications were automatic and were made without the direct knowledge of the leaders themselves, although actually made in their names. For instance, one section of the British Admiralty, wanting something in America, would drive through a message to the naval attaché in Washington in the name of the head of the British Admiralty, not taking into account, of course, the fact that similar requests might be sent in at the same time from the French and the Italians.

That was correct to a certain extent before the end of the war.

The CHAIRMAN. Admiral Sims, Mr. Hoover is here now, and if you will suspend for a while, we will hear from him.

Admiral SIMS. Yes, sir.

TESTIMONY OF MR. HERBERT HOOVER.

(The witness was sworn by the chairman.)

The CHAIRMAN. Mr. Hoover, in his testimony of March 12 Admiral Sims spoke of your well-known intimate knowledge of food conditions and shipping conditions in Europe in 1917, and he suggested that he thought you would be willing to appear before the committee and give us some information on this matter. The committee will be very glad, therefore, if you will give us some information about general food conditions in Europe in the spring and summer of 1917, and also about the shipping conditions during that time.

Mr. HOOVER. My contact in the matter arises over a request that I I had from the Government in Washington to make some investigation as to the food and shipping situation in the month of April, 1917, and I made that inquiry through officials of the French, Italian, and British Governments, and at that time I came into contact with Admiral Sims, and naturally discussed the position with him.

The actual position was that owing to the intensity of the submarine war the Allies had been a great deal embarrassed over their food supplies. At that time the submarine sinkings had reached about their maximum intensity. They were at the rate, I suppose, of somewhere in the neighborhood of 600,000 to 700,000 tons of shipping a month. The actual food situation in the three countries might be summarized in that the breadstuff supply, which was the most critical of their supplies, did not exceed three to four weeks' reserve stocks. By "reserve stocks" we usually refer to the stocks outside of those food supplies that are in process of distribution, such as marketing and retail and wholesale dealing, and so forth.

Digitized by Google

The situation of France and Italy was rather more acute than the situation in England, and the result was, of course, to create the utmost anxiety on all sides as to the situation as a whole.

The shipping position was, roughly, that at that rate of submarine sinkings the war was at a measurable end, and that, as we know, subsequently the rate of sinking was greatly diminished, and further shipping produced, and we managed to struggle through.

One of the alarming features of that situation was that the losses of shipping were largely loaded vessels. They were largely inward cargoes. So that, with the loss of that quantity of shipping, it represented a very large monthly loss of food supplies, and that accumulation had naturally diminished the existing stocks. That is, in summary, the position so far as I could describe it.

The CHAIRMAN. It is true that there was just about enough tonnage available in April, 1917, to supply the absolute needs of the Allies at that time?

Mr. HOOVER. The problem is one of a great deal of complexity, because, as desperation drives, resources were discovered that were not originally contemplated. For instance, it was found from time to time that shipping could be withdrawn from routes and localities that were considered impossible, and ships were applied to special purposes that had not been adapted to it.

We directed the shipping onto the North American market—that is, to the Canadian and American market—as being the shortest voyage, and threw the large load of food supply onto the North American States, instead of relying on the Argentine and elsewhere, where the transportation required two or three times the amount of tonnage, and by devices of that kind what might have been mathematically a desperate situation was ameliorated by degrees.

As I recollect, the total available mercantile tonnage for handling of supplies was somewhere in the neighborhood of 40,000,000 tons. I have not the accurate figures with me, but, as I recollect, we had something like 10,000,000 tons in naval and military transports, leaving somewhere about 30,000,000 tons for transportation of munitions and food supplies. That amount of tonnage would have been sufficient on the reduced supplies that resulted from the strict rationing of the allied countries and the diversion of that tonnage to North America to the shortest route, provided that there were not also continuous losses. It is very difficult to outline, in retrospect, the situation that looms up ahead in any given emergency.

The CHAIRMAN. But it was a fact, was it not, that if the food supplies had been cut off and the submarine blockade had been successful, in the end the Allies would have had to give in?

Mr. HOOVER. Oh, it is obvious that the war would have come to an end almost in a moment if the supplies had been cut off. The most desperate period, I might say, was between April and the following September. With September arrives the continental harvest, and that harvest supplied an available amount of food supplies in those countries. The French would have eight months', the Italians six months,' and the British four months' food supplies. So that, given that, it was possible to get by until the harvest came in, then there was a period of possible relaxation.

The CHAIRMAN. Admiral Sims has testified that in the month of April, 1917, 800,000 tons of shipping were destroyed by the enemy.

Digitized by Google

At that rate or anywhere near that rate, would it have been possible to keep up the feeding of the Allies and the taking care of the armies?

Mr. HOOVER. Well, just my own personal opinion would be that it would not have been so; but, again, I would want to make a reservation on that, because one can not tell how far a population may itself, by its self-denial, and stricter and stricter rationing, more or less, compensate for a deprivation of that sort. The allied countries were never reduced to the final stage of privation during the war.

The CHAIRMAN. But they were on the border line at that time?

Mr. HOOVER. They were in a very serious condition, not only at that time but again in the following winter.

The CHAIRMAN. Again in the following winter?

Mr. HOOVER. Yes.

The CHAIRMAN. And you were looking at the feeding of the allied countries and of the armies as one of the critical things in the war?

Mr. HOOVER. Certainly. I have always felt that it was one of the arms that the American people furnished that served to win the war. I do not believe that any one special effort of the American people can be credited with entire success; but certainly it was one of the great contributing factors.

The CHAIRMAN. And nothing that the American people could have done would have been of more advantage than to destroy this submarine menace, so far as it lay in their power to do so; and every attempt should have been made to prosecute this campaign with vigor, should it not?

Mr. HOOVER. Oh, most certainly; but I would not want to be taken as saying that efforts were not made, simply because I know nothing about the naval policy or procedure.

The CHAIRMAN. You are not familiar with that?

Mr. HOOVER. No, sir.

The CHAIRMAN. You returned to America in the latter part of April, 1917?

Mr. HOOVER. Yes; I arrived here the 2d of May, I believe.

The CHAIRMAN. Did you report on conditions to the Navy Department when you arrived in this country, or soon thereafter?

Mr. HOOVER. I do not think I ever made any special report to the Navy Department. I did report to, I think it was, the Council of National Defense, and I reported to the President.

The CHAIRMAN. And to the President?

Mr. HOOVER. Yes, sir.

The CHAIRMAN. And you spoke to them about the importance of taking care of the submarine menace?

Mr. HOOVER. Oh, yes; that was uppermost, I think, in everybody's mind, that the submarine menace at that time looked to all of us as the most serious question with which we were confronted.

The CHAIRMAN. If we had had available destroyers and smaller boats to take care of the submarines, do you think it would have helped in shortening the war if we had used them for that purpose?

Mr. HOOVER. Well, I hardly know how to answer a theoretical question of that kind. I assume that if we had had a great surplus of available vessels of that sort and could have applied it directly on the problem, it would certainly have helped.

The CHAIRMAN. If we could have applied it, you think it would have had the effect of shortening the war?

Digitized by Google

Mr. HOOVER. I would not want to go so far as that, because the question of the length of the war is one of the most complex questions that one can go into, as it embraces the whole plan of land operations, and the economic collapse internally in Germany, and hundreds of factors that may have been predominant in bringing the war to its end, even the propaganda that broke down the morale of the German armies. That is, I do not refer to allied propaganda but to bolshevik propaganda. So that I feel that is a problem that I would not like to express an opinion upon. It seems to me that can only be determined by history itself.

The CHAIRMAN. Have you any questions to ask, Senator Trammell?

Senator TRAMMELL. Yes. The questions of the chairman are rather hypothetical, Mr. Hoover. I would like to know, as a matter of fact, did not those who were in charge, even though the situation was very acute and very alarming, meet the situation so far as supplying food supplies?

Mr. HOOVER. So far as my department was concerned—and that was my concern—I honestly believe that we made every human endeavor possible to meet the situation.

Senator TRAMMELL. You know of no great losses or any great interference with the progress so far as the supplying of food was concerned?

Mr. HOOVER. No; except the enormous destruction of food and shipping that was sunk in progress.

Senator TRAMMELL. I think that is all that I have to ask.

The CHAIRMAN. You speak of your department. Do you refer to the conditions in Belgium at that time?

Mr. HOOVER. No; I was referring to food problems; because, although the Food Administration was not created until August, I did serve as the medium of furthering the food supplies of the allies, on behalf of our Government, by request of the President.

The CHAIRMAN. And while there was no failure to send sufficient food over, you have already stated that the condition was critical and that the food supply was practically on the border line, and if it had been cut off it would have done great damage?

Mr. HOOVER. The situation was dangerous almost beyond description, and the anxiety in the whole of that period was terrific. I can not overemphasize the critical character of that position and the dangers in which the whole allied cause rested.

The CHAIRMAN. I think that is all.

Senator TRAMMELL. The conditions were very critical, and there was impending danger, but those conditions were met, so that you did not suffer the disaster that was impending?

Mr. HOOVER. No.

Senator TRAMMELL. Is not that true?

Mr. HOOVER. It is manifest that the war was won and everybody was kept alive. That is the answer to that.

Senator TRAMMELL. That is all.

The CHAIRMAN. I think that is all, Mr. Hoover; and the committee is very much obliged to you.

Mr. HOOVER. Thank you.

The CHAIRMAN. Will you proceed, Admiral Sims.

Digitized by Google

TESTIMONY OF ADMIRAL WILLIAM S. SIMS—Resumed.

Admiral SIMS. I have previously stated that some days after sending in my first reports from London I learned, quite by accident, of an agreement as to the disposition of our naval forces in the war zone and elsewhere that had been made between the Navy Department and British and French naval representatives in Washington early in April.

It appears that Admiral Jellicoe had directed the British commander in chief of the North American station to proceed to Washington immediately upon our declaration of war and to lose no time in securing our maximum cooperation, at least in areas outside the war zone.

The agreements reached were set forth in a dispatch from the British commander in chief, which I will quote in part:

APRIL 13, 1917.

From: C. in C., N. A. and W. I., via ambassador, Washington.

Following points of agreement have been arrived at with United States Navy Department. French admiral sending telegram to Paris. Questions raised by British Admiralty.

First. One squadron immediately read to proceed from North Atlantic port on receipt of information of escape of raider. Operations of ships of this squadron will be coordinated with those of allied squadrons. Area of operations from the parallel of Cape Sable to the longitude 50 W., thence south to the parallel of 20 N.

Second. Second squadron on the east coast of South America will be provided as soon as possible in the near future. Area of operations from Brazilian coast along parallel 5 south to meridian 30 W., thence south to 15 S., then parallel with the coast to the latitude of 35 S., then along that parallel to the coast.

Third. Six destroyers will be sent over in the immediate future. These will be based on British or French port, as may be considered most necessary.

Fourth. United States will look after west coast of North America from Canadian to Columbian boundaries.

Fifth. Relations with Chile excellent. United States armed Government nitrate vessels will maintain continuous service for the present, which will be utilized.

Sixth. United States China squadron will be maintained for the present.

Seventh. United States will supervise Gulf of Mexico and Central America, as far as Colombian boundary; thence to West Point and Jamaica, along north coast of Jamaica to the east point of Virgin Islands, thence north to the southeastern limit of area referred to in first.

Eighth. If, and when, enemy's submarines appear, they will attempt to send several submarines to the Canadian coast, but this only possible if a parent ship or accommodations of men on shore provided.

Following points raised by French minister of marine:

First. Provision of small patrol vessels for French coast not yet possible owing to requirements of home defense. When available, however, they will be supplied, France escorting them over and manning, if necessary. Every possible effort will be made immediately to supply these. Too much reliance should not be placed however, in early success.

Second. Provision of armed naval transports for carrying (?) (railway material) to France. One will be furnished immediately, a second and third as soon as possible.

It will be noted that the agreements, except as to the third paragraph, relate mainly to employment of forces elsewhere than in the war zone but, until I learned of this agreement by accident, I was totally unaware that any conference had been held. I learned from Admiral Jellicoe that he did not regard the agreement as embodying the full measure of cooperation needed from the American Navy; but, on the contrary, that the specific arrangements provided for in this agreement were intended to cover only the situation outside of the critical submarine zone. How it was regarded in Washington I had no idea.

Digitized by Google

It very early became apparent to the other naval officers on duty in Europe, that nothing but confusion could result, if each one of the allied Governments were to go independently to the Navy Department with every request that they had to make for forces or assistance. Thus, for example, the American naval attaché in Paris, Commander W. R. Sayles, came to London to see me in London at the end of April, 1917, with regard to requests being made by the French, and I found that he was in entire accord with the view that immediate concerted action was necessary to combat the growing submarine menace, and that the military necessity of the situation demanded the immediate centralization of all recommendations as to policy, made to the Navy Department by the European powers. He cabled this recommendation to the department on April 29, and, throughout the next three months, worked in complete harmony with me in an endeavor to coordinate our relations with the British and French navies.

I will say throughout the first three months, because at the end of that time I had a special representative there, who took over the duties.

In order to show clearly what confusion resulted from the method followed by the department, of acting upon recommendations from many different quarters, it is only necessary to review the cases of the establishment of naval bases in France, and the sending of our first patrol force, and our first aviation unit, to France. To these I referred in paragraph 64 of the letter which is under investigation before the committee.

As I had learned from Commander Sayles, the French naval attaché in Washington had requested the department to send patrol vessels to France, and to establish bases on the French coast. I learned of this during my visit to Paris in the first week in May. At the end of these conferences that were held at that time, I had sent to the Navy Department on May 5 the following dispatch:

From: R. Admiral Sims to Navy Department. Sent from Paris, May 5, 1917.

Relations with the French Navy Department very satisfactory. Conference with minister and chief of staff and French attaché, London, and British attaché, Paris, and first sea lord resulted in unanimous agreement that our destroyers force should remain concentrated, and should attack the enemy submarines in whatever area they may be operating in greatest numbers. Probably principally in the area from the south to the west-northwest of Fastnet.

SIMS.

Fastnet being the south point of Ireland.

As will be noted, the French navy department was in complete agreement as to the necessity for concentrating all of our effect in one area. I learned later in the month, from the naval attaché in Paris, that the Navy Department intended to send patrol vessels to the French coast. I had received no information, directly or indirectly, from the department of this intention. It should not be understood that I am criticising the department for sending vessels to the French coast, or acting with the French naval attaché in making that decision, but there were many preliminary arrangements to be made for the handling of any forces to be sent to the French coast, which required definite information. On May 15 the naval attaché in Paris cabled the Secretary of the Navy as follows:

Digitized by Google

The French ministry of marine has asked for information to be furnished, at the earliest practical moment, giving the characteristics of patrol vessels of the Navy to be sent later to France, and inquiries also if they are to be accompanied by supply ships. Please furnish copy of this cablegram to Admiral Sims for his information.

On May 21 the department replied to the naval attaché:

MAY 21, 1917.

NAVAL ATTACHÉ, *Paris:*

In connection with wishes of the French commission, the department will send 10 or more yachts for service against submarine boats off the coast of France. Leave here about June 1. Request definite information in regard to supplying with coal and stores when based on French Atlantic or channel ports. 14020.

DANIELS.

I was informed of this only through receiving a copy from the naval attaché at Paris.

The naval attaché, on May 23, informed the department that such forces as were to be sent would require their own colliers and supply ships, and should be self-supporting.

The information thus far received from the Navy Department had not been sufficient to enable any plans to be made for receiving the forces to be sent to the French coast. In a cable of May 14 I had pointed this out, saying among other things:

It would be of assistance in work here if department could send information dispatches concerning prospective plans affecting United States forces in European waters. Information is particularly needed as to following: Number and character of antisubmarine patrol vessels which are available, or may possibly be sent this side; number and character of patrol vessels to be sent to France.

No answer was received to this cablegram. After further conference with me, Commander Sayles cabled the Secretary on the 1st of June, requesting similar information, as follows:

AMERICAN EMBASSY,
Paris, June 1, 1917.

SECNAV, *Washington:*

After consultation with French ministry of marines we are in accord in urgently requesting more detailed information regarding naval and military units en route for France. Arrangements for berthing spaces, their protection off French coast, efficient cooperation with French Navy require that ministry of marine would receive full advices as to composition of forces, intended employment, what bases to be used. If department thinks advisable, on account of possibility of enemy having my secret code, information should be sent through French naval attaché in Washington. My opinion efficient prosecution of campaign demands that French ministry of marine should receive immediately information possible. 12001.

SAYLES.

In a number of letters about this time, I repeated my request for information concerning these forces. On June 7 I cabled again:

Request information of any further addition to our forces, here or in France, and prospective dates of sailing.

Neither the naval attaché, it appears, nor I, received any reply to either of these messages. In a message which I received from the department on June 20, in reply to my many cables in May and June, no reference was made to forces to be sent to France, except for a statement that 12 fishing vessels would sail in August for France.

I wish to make clear at this point that, when I first went abroad in March, 1917, my paramount duty was to act as the representative of the Navy Department. On April 28, 1917, I was designated to command United States destroyers operating from British bases. It was not until June 14, 1917, that I received the title of commander

Digitized by Google

of all the United States naval forces in European waters. From this date, then, June 14, 1917, I was in command of all of our naval vessels in European waters: still the department continued to carry on negotiations direct with French representatives and with our naval attaché in Paris, thereby tending to diminish my authority and hence weaken the efficiency of our naval participation in Europe.

On July 3 I received a message from Brest to the effect that the *Corsair* and *Aphrodite* had arrived there, and that eight other yachts, all under the command of Capt. W. B. Fletcher, were due to join them. On July 5, in a dispatch from the department, I was informed that "eight patrol boats under Capt. Fletcher due to arrive French coast July 5. Ten more yachts will sail about July 15 to join him." That is, the yachts had arrived at Brest three days before the first official message I had received from the department concerning their sailing. It is true that the naval attaché in Paris had been informed by the department of the sailing of the yachts under Capt. Fletcher, but no information had been given concerning their orders, or the prospective plans of the department for their operations. The result was that when they arrived, the French had made no plans for their reception; neither the French nor our naval attaché in Paris had received any information as to the character of their operations; and it had been impossible to make any arrangements for caring for these ships, or utilizing them immediately in the campaign against submarines, and it was nearly two weeks after their arrival before they were actually employed.

Much the same situation arose in connection with the establishment of our naval bases at Brest and Bordeaux. I received my first information of the plans of the department in this connection on the 8th of May, in the following dispatch:

[Cablegram.]

From: Secretary of the Navy.
To: Rear Admiral Sims.
Received: May 8, 1917.

The French have requested, and United States Navy Department contemplates establishing temporary bases at Bordeaux and Brest, with one line officer, one pay officer, and one engineer officer. You are requested to advise on this, and it is requested that your reply be expedited.

DANIELS.

To this I replied:

[Cable sent department May 8, 1917.]

The establishment of temporary bases at Brest and Bordeaux are very desirable, but should not divert in any way the necessary repair, supply, and fuel vessels from the mobile destroyer base. It is urgent that the destroyer force remain concentrated with mobile base ready to follow any movement of main submarine activity on high sea trade routes.

In later dispatches, I requested further information with regard to the plans for the establishment of these bases, and requested that experienced line officers, with a knowledge of French, should be detailed to this duty. The specific recommendations that I made were disapproved by the department. Plans were drawn up early in June by the French ministry of marine for the establishment of a shore base at Bordeaux for the American Navy. Copies of these plans were transmitted to Washington, with a request for approval, but no information was received by me or the French from the

Digitized by Google

department as to what their plans were or their action on the French plans. Early in June I was informed that two retired officers had been designated to command the bases at Brest and Bordeaux, respectively, and that they would be accompanied by a paymaster and an engineer officer each. In spite of repeated requests, I received no further information concerning the plans for these bases until July, some six weeks later, and then only in a personal letter, dated July 13, from New York, from the engineer officer detailed for one of these bases. This letter is very illuminating as showing the confusion that existed. It is as follows:

NEW YORK, *July 13, 1917.*

MY DEAR ADMIRAL SIMS: I am writing advising you of a situation that will no doubt be of interest to you. I am to be assigned to duty in connection with the base at Brest. Just what is to be done over there is very indefinite, and no one in authority at the department seems to have any definite idea of what is expected of the place, what the French are able to do, and what should be sent over there. From the number of vessels that will probably be sent over I think a fairly well-equipped base will be essential. The Navy Department, as near as I can gather, has the idea that the French can do all the repair work that will develop. This I doubt, as they probably have their hands full with their own work.

To really cover the requirements, I think we ought to have a considerable number of our own mechanics and a thoroughly planned base organization provided; also a supply or repair ship designated for special use to supply the base.

I have suggested that the tentative order inclosed be issued to cover the situation, but it is doubtful whether this will be done, and a watchful-waiting policy may prevail instead.

However, I have thought that if you will ask for adequate facilities attention might be paid to it. There is not much planning ahead in the department and there is no one definitely charged with planning for such things as base facilities and maintenance. I have orders to sail shortly, but no information or instructions as to what I will do or what I will have to do it with. I can presee that a lot will be required, preparation for which should be started immediately, but some authority to start must be given.

The department expects to have Commander Baldwin report what is needed, but I don't know whether he has full information of the number of craft that are to be provided for, and as far as that is concerned, I can't get that completely either. I do know, however, that whatever equipment that can be made available can be used and that it will be better to have too much than too little. So if you would bring to attention of the department the need of repair facilities, preparatory action might be taken and thus time would be saved. I don't think there will be much preparatory action from this side unless you make your wants well known in advance. It may be that I am overestimating what is needed in the shape of material upkeep and repair facilities, but viewed in the light of experience covering similar situations I don't think I am proposing anything that will not be seriously needed within four months time, unless, fortunately, the war is at an end then,

Lack of material preparation and upkeep will check any proposed military action. The presence of abundant material facilities will enable much to be done: half-way action is likely to end in disaster. We have Gallipoli and the Mesopotamia expeditions to remember.

I am advising you of this situation at earliest possible date and when I get over will further communicate the details of the situation so that other wants may be provided for. Any information as to probable demand for base facilities would also assist those at the base in making proper provision.

BASE PROPOSITION.

1. Base will have to meet the requirements of 20 to 40 yachts, 20 destroyers, 40 or more trawlers, and possibly a considerable number of submarine chasers. The work required will be very much like that which was demanded of Cavite during the Philippine insurrection. The number of vessels will probably be increased.

2. The United States will have to supply everything for its vessels, except possible use of tools of French arsenal. Too much rather than too limited facilities should be provided.

3. The essential needs will be:

Material and supplies such as are required for operation and repair.

Digitized by Google

A United States repair force familiar with United States machinery.

Such machine tools as can be found and supplied.

Hand tools in considerable quantity; drills, files, tap and dies, etc.; pipe fitting and cutting outfits, welding outfits, etc. These are also needed to replenish the articles on the vessels.

4. The quickest way to be started is to have some vessel assigned as base supply. Such vessel should have a naval crew, and should collect at Norfolk and New York yards such material, supplies, and personnel as can be made ready immediately for base purposes. This should include building material for base storehouse and base quarters for personnel.

5. As soon as a load of material is prepared send vessel across. Vessel to house mechanical personnel till such times as facilities are prepared on shore, then unload and go back for such additional supplies, tools, facilities, etc., as may have been assembled in the meantime. This vessel could keep the base supplied with most of the things it will be used for and any available cargo space could be used for any other freight. If needs become greater, more than one vessel might be assigned to the work.

6. Immediate authority is required—

(1) To have a suitable vessel assigned.

(2) To recruit a repair force, allowing navy-yard employees to volunteer, allowing their rate of pay plus subsistence, and including naval reserves in Regular Navy having mechanical training, and such men as can be collected from availables at receiving stations and districts. About 100 should be taken to begin with, numbers to be added as needs indicate.

(3) Give base commander authority to spend money as needed in France for such matters as can be procured there.

(4) Bureau of Construction and Repair, Ordnance and Steam Engineering to authorize Supplies and Accounts procure and prepare for shipment such material and supplies as may be deemed required in the near future for such vessles as are to be based abroad outside of facilities to tenders.

(5) Vessel assigned as base supply vessel to be routed as required by base commander, subject to superior authority as necessary.

7. As soon as base commander reports prospective needs, all available material and facilities should be prepared for shipment from the several navy yards.

There is attached to that letter a paper mentioned in the letter, a plan. This paper contains a remarkably accurate forecast of what was found ultimately necessary at Brest and what was actually established in the course of our occupancy of that base, and I would suggest that that be included along with the letter. This is addressed on August 10, from Bordeaux, France, to the headquarters in London. It is as follows:

BORDEAUX, FRANCE, *August 10, 1917.*

The situation in France is not quite clear to me. I suppose the trouble is that we have too few officers to attend to matters. It occurs to me to tell you of the situation at Bordeaux, so that you will know just where I need to be enlightened.

About June 1 Admiral Palmer gave me preliminary orders to go to Bordeaux in command of the American naval base. I asked him what the duties were, and he said he knew nothing about it. I asked the same question and got the same answer from all the other heads in the Navy Department. I knew there was no base at Bordeaux, not even a French naval base; and something would have to be created, and I applied for an Engineer officer and a paymaster and several yeomen. After waiting about four weeks I got orders to proceed with the following party, but still no instructions. Paymaster Colby, with two assistant paymasters, N. R.; Lieut. Bernier, N. R., engineer officer; Asst. Surg. Stevens, N. R.; and three yeomen. They all had orders to report to me at the naval base, Bordeaux. We arrived here July 18.

I have made contracts for the land and rented some buildings and contracted with the commercial wharf for handling of coal. We have 1,800 tons of coal left here by the steamship *Sioux*. I find it embarrassing to deal with the people here unless I have definite instructions about what we are going to do. If necessary Paymaster Colby can go to London to close contracts for material ordered in England, but I would prefer to do it by mail if possible.

To this letter the following reply was sent, pointing out the difficulty which was being experienced in getting action from the depart-

Digitized by Google

ment. This extract from the letter is pertinent. The letter is dated August 14, 1917. [Reading:]

I find that the matter of the base at Bordeaux is not yet settled, owing to the department's delay in replying to a cablegram sent a week ago setting forth the situation and requesting authority to expend about $100,000 for the purpose of establishing the necessary facilities. Paymaster Colby was here at the time the cablegram was prepared for dispatch and has probably informed you of the contents before now. The cable was sent on the 7th, and we are to-day sending a follow-up message asking for prompt decision.

NOTE.—After considerable delay the department disapproved the expenditure of this money.

A full report of the situation existing at Bordeaux was sent to me on September 19. From this I will read you just a few paragraphs to show the confusion which resulted from the action of the Navy Department, and its failure to coordinate this action with other activities abroad, or to keep their representative in Europe, or the Allied Governments, informed of what they were doing. [Reading:]

AMERICAN NAVAL BASE,
No. 3. *Bordeaux, France, September 19, 1917.*

From: Commanding officer.
To: Vice Admiral W. S. Sims, United States Navy.
Subject: General report of conditions in Bordeaux.

1. The policy of the department in regard to Bordeaux is not very clear. The following history may throw some light on the subject. About June 1 the Chief of Bureau of Navigation gave me preliminary orders to proceed to Bordeaux and assume command of the American naval base. I asked for several assistants, which resulted in the following being ordered to report to me at Bordeaux: One paymaster, two assistant paymasters, one assistant surgeon, one lieutenant (engineer), and four yeomen.

2. I made diligent inquiry in the department as to their plans for Bordeaux, but learned nothing. Capt. V. O. Chase took the matter up and wrote me at New York at some length that he could learn of no plans, and that I would have to come over here to find out what was to be done.

3. The French naval attaché in Washington told me that our Navy Department had agreed to establish two bases in France.

4. Secretary Daniels stated in a lengthy article in the New York Times in June, that he had already established two bases in France.

5. The monthly Navy Directory of June 1 mentioned the American naval bases at Brest and Bordeaux.

6. Lieut. Commander Dinger, who recently arrived at Brest, told me that Capt. W. V. Pratt told him that the department would not establish any extensive naval bases in France.

7. Commandant Simon was ordered to report to me as liaison of the French Navy. He was also a member of the French commission to Washington. He gave me to understand that the French Navy Department expected that our Navy would install at Pauillac sufficient facilities to furnish coal supplies and repairs for a few patrol boats, and with that understanding the French began building a new wharf for our yachts.

A very similar situation arose in connection with the first aviation unit sent to France. I learned from Commander Sayles, while in Paris early in May, that American naval personnel was to be sent abroad by the department for training in French aviation schools. Neither I nor the naval attaché in Paris had received any official information concerning this. On May 14 the naval attaché in Paris therefore cabled to the department as follows:

SECNAV., *Washington:*

On May 6 French naval attaché Washington reported that Admiral Chocheprat stated he would send on colliers men designated for aviation training in France. French ministry of marine has requested me to ask for detailed information on this subject. How many men, what grades, what previous experience in aviation. 18014.

SAYLES.

Digitized by Google

Nothing further was heard from the department with regard to to this detachment, except a brief message to the effect that an aviation unit was sailing on the colliers *Neptune* and *Jupiter* for France. When the unit arrived in France they found that no definite arrangements had been made for their training, as the information furnished concerning the number and composition had been insufficient to make this possible. I will read you, from the report of the commanding officer of this detachment, the results of this situation:

It being necessary to confer with the French marine relative to disposition and training of men, I departed with Paymaster Conger for Paris on June 12. We arrived on the morning of June 13 and that day made the following calls: On the American ambassador; the naval attaché; the French minister of marine; Admiral Lacaze, the chief of the general staff; Admiral de Von, the chief of the aeronautic section; Captaine de Fregate Cazenove; and the paymaster in chief of the French Navy.

A conference was immediately begun as to the disposition of our forces, the officer representing the French marine in this conference being Capitaine de Vaisseau Laborde.

It developed that there was practically no understanding as to the arrangements made in the United States whereby this detachment had been sent to France. I explained that the French authorities in the United States had stated that even though we had no trained aviators, student aviators and mechanics would be a welcome help and could be very quickly trained in France so as to be speedily available for use in the war against the Germans, in which they could be of the utmost service. The French expressed their gratitude and bade us welcome in an enthusiastic manner.

They explained that the detachment of 122 men, comprising 65 student pilots, 38 mechanics—the others being yoemen, hospital corps men, cooks, messmen, and servants—was entirely unbalanced and that for each pilot aviator there are required at least 10 men; that in addition to the pilot aviators there are required observers, who are men specially trained to observe, drop bombs, operate machine and rapid-fire guns, etc.; that there are schools in which such training is given; that besides pilot and observer aviators and mechanics there are required helpers, fabric workers, joiners, chauffeurs, motor-boat coxswains and engineers.

It is to be noted that the commanding officer of this detachment had no orders to report to me, and that much embarrassment was occasioned when the unit arrived, as can be inferred from the report that I have read you.

These cases are typical of the obstacles which I found in the first months, through lack of information concerning the department's plans and activities. As I have repeatedly stated, much of my information concerning the activities of the Navy Department at this time concerning the movements of our own naval forces I received only accidentally, by learning of them from allied navy departments, who had been informed by their attachés in Washington. Thus, while in Paris, on May 6, I learned from the French ministry of marine the following five items, of which I had no information from the Navy Department at that time:

First. That the second group of six destroyers, commanded by Commander Courtney, had sailed from Boston. I did not receive confirmation from the Navy Department until May 9, three days later.

Second. That a hundred cannon were being sent to France on the colliers *Jupiter* and *Neptune*. I had received no information at this time and, in fact, received none whatsoever until toward the middle of June, concerning the sailing of these two colliers for France.

Third. That an American aviation unit was to be sent abroad. To this I have already referred.

Digitized by Google

Fourth. That two naval officers were to be sent to establish American bases at Brest and Bordeaux. It was not until two days later that I was informed that bases were to be established at these places.

Fifth. That a vigorous campaign was being waged in the press in America for a more energetic warfare against submarines either through a complete barrage in the North Sea or by an attack upon enemy bases. This point I will deal with later in discussing the plans proposed by the department.

Similarly, I learned from the French naval attaché in London, on May 10, that the patrol vessels for the French coast would be coal-burning and their departure was being delayed "by the question of price;" also that these 25 patrol vessels would probably leave some time between May 5 and 30, and 25 more the beginning of June, to be based on Brest and Bordeaux, and that these forces and bases would be under my command. Needless to say, I never did receive any confirmation of this information, and it was many months before there was as many as 50 patrol vessels on the coast of France. I also learned at this time that the Navy Department was arranging to turn over to the French, to be operated by the Frecnh Navy, from 50 to 100 submarine chasers, the first of which would be ready in August.

Similarly, I was constantly receiving information from the British Admiralty concerning movements of our own forces, concerning which I knew nothing, although of course the British assumed that I had received full information. Thus on a single day, May 29, I learned at the Admiralty:

First. That the fifth destroyer division had sailed from St. Johns for Queenstown.

Second. That four additional destroyers had been ordered to leave New York on May 23.

Third. That the collier *Jupiter* had sailed from New York on May 19 for France; and the *Neptune* would sail from Norfolk on May 21 for Brest. That each would have a convoy of two destroyers that would join the forces at Queenstown after arrival in France.

I had repeatedly pointed out to the department how necessary it was that I should have full information of the department's action with regard to sending of forces abroad, and of knowing what their general plans were. I have already read you my message of May 14 requesting this information. In another message of May 16 I again pointed out how important it was that my activities, and those of the department, should be coordinated, and I urgently requested that I be given the information desired, and "of the situation at home as it affects the forces and my duties of cooperation here." I pointed out in the same cable, and in a letter of the same date, how vitally important it was that the Navy Department should profit by the experience of the allied navies during the war; and how it was only possible to do so by sending over trained officers who could gather this information and transmit it rapidly to the department, in order that the department might prepare our forces for any future contingency, but no reply was received to any of these requests for information.

In my cable of May 31 I emphasized again the same point, calling attention to the difficulties of my position. Some idea of what this

Digitized by Google

really was can be gathered from my letter to the department, of June 8. I will read you, for example, paragraph 10 of that letter:

[Letter to department, June 8, 1917.]

At times I have been in ignorance, or in doubt, as to the proposed movements of our forces, and also as to their actual movements, until information was first obtained from the British Admiralty.

I wish to make it quite clear that there is no possible objection to timely, accurate, and complete information being sent in this manner; but the point is that at times I have received my first knowledge of important information from a casual reference in a British cablegram upon another subject. The assumption of the official who sent the cablegram (usually Admiral De Chair or Capt. Gaunt) has apparently been that I had full information and had communicated the same to the British Admiralty. Such incidents are not only somewhat embarrassing, but necessarily create an unfavorable impression which is not removed by subsequent information.

Examples in point are as follows:

Department's notification of sailing of *Cushing* division received three days after vessels had sailed from Halifax, information of their sailing from the United States having been learned in the Admiralty. Information was received from the Admiralty that sailing of the "fourth flotilla" had been postponed indefinitely, but have no confirmation of this fact to date.

On May 29 received department's cable that *Patterson* division had sailed from St. Johns on May 26, having seen a previous Admiralty dispatch from British commander of this sailing.

I was sent for by French chief of staff to arrange for escort of *Neptune* and *Jupiter* through danger zone. At that time I had no information of the movements of these ships. Informed later by Admiralty that destroyers were accompanying *Neptune* and *Jupiter*, and were to join Queenstown forces later, but have no confirmation of this fact to date.

I have received repeated inquiries concerning the number and character of patrol craft to be sent to France which I was unable to answer.

Another striking case of the failure of the department to send adequate and timely information concerning their activities is illustrated by the case of the *Dixie*.

I may say that the *Dixie* was one of the mother ships of the flotilla that was coming over.

I had been notified early in May that the *Dixie* could be sent if needed, and had cabled back urgently requesting her services, to add to the repair facilities at the destroyer base. I received no further information concerning her sailing in spite of my requests. On June 10 I received a dispatch for retransmittal to the *Dixie* concerning pay accounts. A few hours after this dispatch arrived the *Dixie* herself appeared off Queenstown, and as it so happened ran right through the middle of a mine field laid by submarines a few days before. I learned later that the department had cabled me on the day of her sailing, but the message, for some reason which was never explained, was addressed to me at Petrograd instead of London, and consequently did not reach me. This serves to illustrate the consequences of failing to give sufficient advance notice of such sailing.

Similar difficulty arose concerning the arrival of the oiler *Kanawha* at the end of June, and in the case of the destroyers which accompanied the first troop convoys abroad. I had had no information concerning the number of destroyers until they actually arrived at St. Nazaire, nor did I know, for over a month after the *Kanawha* had sailed from New York, the orders under which she was operating. These illustrations should be sufficient to indicate what I meant, in my letter of January 7, when I stated that the department frequently omitted to keep its naval representative abroad informed of its plans,

Digitized by Google

intentions, and sometimes, moreover, the movement of forces into the European area.

To illustrate the real need for such information I quote from my letter No. 29, of July 14, 1917, to the Navy Department:

4. It is very necessary that I should have advance information of movements of ships and orders under which they are operating. In the case of fuel ships, if they are not to be detained in European waters, I must arrange for their being sent to the proper destination to discharge their cargoes. In fact, if the *Kanawha* arrives at Queenstown this week, she will either have to be escorted to another port, or delayed there until there is sufficient room in the Queenstown tanks to take her cargo, as these tanks have just been filled by British fuel ships.

5. It is also very necessary that I should have a general idea in advance of the cargo being sent over by supply ship, such as the *Celtic*. Our parent ships obtain fresh provisions from shore as much as possible, reserving the cargoes in their cold storage. It is necessary therefore that they make room in their cold storage for receipt of cargoes from supply ships in order that the supply ships may not be unduly detained.

Information is just coming through this morning in Navy Secret Code concerning the *Celtic's* cargo. This will be too late to serve the purpose for which it was needed, as the *Celtic* is due to arrive in the course of the next few days. I assume from certain unofficial information received that the *Celtic* will have supplies for the yachts based in France, in addition to the *Melville* and *Dixie*, and have taken steps to provide escort if such proves to be the case.

DISPOSITION OF FORCES.

Another of the matters in which I found great embarrassment, because of the department failing to keep me informed of their decisions, was that of the disposition of forces. It is unnecessary for me, at this point, to read again from my early cables and letters, in which I was emphasizing the importance of keeping the American forces together, to operate as a combined unit against the submarines, in the area of their greatest activity. I had also repeatedly pointed out to the department the fact that a general view of the whole situation was available only abroad, where, through personal conferences with the heads of the allied navies, all needs could be considered, and arrangements made for the most effective use of such reinforcements as the United States Navy could afford. I had thus from the first urged that all of our destroyers be concentrated in the most critical area of all, that south of Ireland, where shipping routes from overseas focused—these destroyers to be based on our own repair ships, stationed at an Irish port. Later on I repeatedly asked the department, in making assignment of any new ships, to consider the recommendations I was making. All the Allies were making numerous demands upon the Navy Department. I have already referred to the requests from the British, French, and Russian Governments, for certain specific assistance. Such requests were being made of me, as well as of the department.

It is true that the department assured me, on more than one occasion that, to quote from their message of June 24:

In making the local assignments abroad of forces the department requests, and will be guided by, your advice, which should be given after consultation with the various Admiralties concerned, as to the priority of requirements.

All of my recommendations, from the time of my first cable, had been in accordance with these fundamental instructions from the department.

Digitized by Google

Let us see in what way the department was guided by my advice. I had repeatedly requested the immediate increase of our antisubmarine forces and the concentration of these forces in the critical area.

On June 29 I recommended the immediate sending of gunboats in addition to destroyers, tugs, and yachts.

I was not consulted by the department with regard to the number and character of the vessels sent to France in June, or later months, and, similarly, the first indication that I had that the department intended to send forces to Gibraltar was in a message of July 5, in which they said:

Department is strongly impressed with the necessity for adequate antisubmarine patrol in and off entrance to Gibraltar. Ten vessels are available to send across, if considered that they can be of value.

The point to be emphasized here is the fact that such a decision, as to disposition of forces in European waters, was made by the department without reference to their representative abroad, who was in a position to thoroughly underrun all individual allied requests for assistance, and determine priority in accordance with departmental instructions and the needs of the situation.

I replied to this, after consultation with the Admiralty, that the vessels of the gunboat class, named by the department, would be very useful for antisubmarine work at Gibraltar. I realized that this was a digression from the policy which I had been insisting upon from the start, of concentrating all reinforcements in the critical area. However, I felt that I could not possibly explain the necessities therefor any more fully or clearly, and it seemed now to me that I should grasp any opportunity of getting forces across the ocean. Their subsequent disposition could be determined later. It was quite true that forces were needed urgently in all areas. The lines of communications to the armies in the near and far East were being hard hit at this time by submarine operations in the Mediterranean. It was simply a case of accepting the best that could be obtained.

I was accordingly informed by the department on July 14, 1917, that 11 vessels, which had been named in previous messages, and included gunboats and light cruisers, had been directed to prepare for distant service under the command of Admiral Wilson, and would sail for Gibraltar at the earliest possible date.

An even more striking illustration of the manner in which the department failed to carry out its policy announced in its cable of June 24, which I have read you, is to be found in the case of the forces sent to the Azores.

The Germans had fitted out the big submarine *Deutschland* to assist in the submarine campaign, and this ship began her cruise in the summer of 1917 in the vicinity of the Azores.

It was obviously a diversion on the part of the Germans of a character already described. It was therefore no surprise to learn on July 5 that this submarine had actually bombarded a port in the Azores. This, of course, could have no effect upon the progress of the campaign other than a moral one. No damage which could be inflicted in the Azores could appreciably affect the issue. After a consultation with the Admiralty as to what action should be taken to meet such diversions it was decided, and I stated in a cable of July 13 to the Navy Department, that two submarines, with a decoy

Digitized by Google

ship, might profitably be sent to the Azores for operations against these cruising submarines, as such craft had the best opportunity of successfully attacking this class of submarine.

I may say right here that the object of sending them there was to keep the Germans from using the inlets and bays of the islands as a resting base. It had been discovered earlier in the war that submarines sometimes would put in to uninhabited islands and anchor their boats and make certain repairs and rest their crews.

As a matter of fact, one of these submarines was torpedoed later in this same area by a British submarine. I heard nothing from the department as to this recommendation. The first information that I had that any forces were being sent to the Azores was received on July 19, when I learned through the Admiralty that four destroyers, with the *Panther*, had arrived in Bermuda en route, apparently, for Europe. I had received no information from the department, but by this time I had become thoroughly accustomed not to receive such information, and therefore assumed that these forces were probably bound for some station in Europe. Accordingly I cabled the department on July 21 and 22, again pointing out the necessity for destroyers in the critical area and asking that these coal-burning destroyers be sent, together with all other destroyers available. In my cable of July 21, for example, I said:

JULY 21, 1917.

Secnav, Operations, Washington.
No. 122.

Conference with Admiralty to-day results in recommendation that destroyers from Manila base on Gibraltar while situation remains as at present. Also that *Panther* and those sent to Azores base on French coast, probably Brest, because of open harbors at Azores and superior facilities Brest, and less steaming necessary for escort duty, and particularly for effect on French. *Panther* also urgently needed for yacht squadron. 16621.

SIMS.

I may say that the destroyers mentioned there as going from Manila to the Mediterranean were too small and had too little radius of action to act as escort destroyers for the North, off the coast of Ireland and France. They were only 420 tons instead of 1,000 tons.

On July 27 I received a message from Ponta del Gada, Azores, in an undecipherable code, and on cabling for a repetition, or explanation, received the following message:

AUGUST 1, 1917.

Origin: Ponta Delgada, Azores.
Admiral SIMS, *London*.

Replying to your cable 18027. We have reported to you the arrival of the U. S. S. *Smith*, and the U. S. S. *Lamson*, 08026 Ponta Delgada Azores,, in accordance with the department's orders, and have registered a cable address, Senafloat, Ponta Delgada, Azores. There has been no information with regard to German submarine operations since July 22. Have cruised around all the islands, return Ponta Delgada. Thanks. 06031. 12031.

There is no signature to that. I do not know what "Thanks" means.

From this message it appeared that it was clearly the department's intention that these vessels should remain at the Azores, and operate under my orders, as the vessels had reported to me in accordance with the department's orders. I had still heard nothing whatsoever from

Digitized by Google

the department. Accordingly, on August 2, I sent to the Secretary of the Navy the following message:

Cablegram sent August 2.
To: Secretary of the Navy, Washington.

108. *Smith* and *Lamson* have reported to me their arrival Azores. They find no information there regarding submarines since July 22, and have cruised around all islands and returned to Ponta Delgada, where they are now apparently awaiting orders. Request authority to order this division and *Panther* to join destroyer forces temporarily, until they can be instructed in methods and means of communication now in force. Will probably then wish to base them on Brest, particularly to assist in escort of troop ships.

SIMS.

To this message I received only a brief statement that the department, for special reasons, desired these forces to continue to operate in the Azores. But they did not state their request.

Nothing was stated with regard to their orders, nor was it clear in my own mind as to whether they were actually under my orders. I received nothing further from the department concerning these forces. On the 18th of August, I learned, again through the admiralty, that eight United States destroyers had arrived at Bermuda, and the *North Carolina* and three further destroyers at St. Johns, the admiralty being under the impression that they were all bound for the war zone, as in the case of the four which had proceeded to the Azores. As the situation was becoming increasingly confused, I sent the following message:

Cablegram sent August 18, 1917.
To: Opnav, Washington.
Simsadus 295.

Request information as to final destination of United States forces recently arrived at Bermuda and St. Johns, and orders under which force based on Azores is operating. Two allied countries have forces operating in same area, and this information is required in order to coordinate their activities. 18218.

SIMS.

I might say right there that the reason was, seriously, this. I have previously explained how dangerous it is for submarines of different allies to be operating in the same neighborhood. As the allied forces had submarines operating in the vicinity of the Azores it was necessary that I should see them every day so that I could coordinate what they were doing and keep my forces under command so as to keep them from bombarding the other fellow's, because they might come in contact if they were not under my orders.

This is perhaps a detail, but it is nevertheless a very significant one, as illustrating the extent to which, in so far as our own Navy Department at least was concerned, we had at that time anything approaching to what might be called "unity of command." The department replied as follows on August 23:

From: Chief of Naval Operations.
For: Admiral Sims, London.
Received: August 24, 1917.

Opnav 221. 18218. Destroyers recently arrived at Bermuda Islands will return this coast. Yachts sailing from St. Johns, Newfoundland, are attached to patrol force duty coast of France, under Capt. Fletcher, United States Navy. The Azores Islands force is at present operating under orders to patrol in vicinity of these islands 12023.

ADMIRAL BENSON.

Digitized by Google

That means, return back to America.

It is to be noted that this message did not state that the Azores force was operating under my command, nor did it give any indication with regard to plans concerning their future employment. I might add that if I had been content not to go beyond the strict letter of my instructions from the department, but only, as it has been stated in the press, to mind my own local business, and these forces in the Azores had followed the same principle, they would have been left in the air, trying to get detailed instructions from day to day from Washington. In passing, it should be noted that these forces experienced great difficulty at the Azores, because no arrangements or preparations had been made for their coming. They found themselves in difficulty with the Portuguese officials, who, apparently, were as much surprised by their arrival as I had been. It was with great difficulty that they could purchase stores.

This following little item here I will ask the press not to mention. It is a matter which I should prefer should not be given publicity on account of its international aspect, but the fact remains that the Portuguese officials actually viewed the presence of these ships with suspicion, through the failure to prepare the way for their coming, and it is a long and rather unfortunate, as well as in some aspects ridiculous, story, as to the local experiences which resulted from this situation. There is no need, however, to bring out such sidelights on the war in this inquiry.

In my letter report to the department of August 20, I summed up the case as follows:

AUGUST 20, 1917.

It is important that I should be kept generally informed of orders under which independent forces in the Atlantic are operating, for example: I am not aware to date of the orders under which the destroyers at the Azores are operating. A number of messages have been received from that force which were unsigned and which have been reported to the department.

Both the French Ministry of Marine and the British Admiralty have inquired as to the number of destroyers at the Azores, how long they intended to remain in that vicinity, and as to the nature of their operations. A British submarine and decoy ship have been sent to operate from the Azores during the last week, and Portuguese forces are also there. It is manifestly important that allied operations should be coordinated.

Information concerning enemy activity in all areas in the eastern portion of the Atlantic, as fast as it becomes available in France or England, should be utilized to the best advantage of the forces concerned. This information will, of course, be transmitted to the Azores forces as fast as it becomes available, but it can be handled much more intelligently if full information is available as to the orders under which the forces involved are operating.

I have learned from the British Admiralty that eight United States destroyers, apparently from the Pacific Fleet, have arrived at Bermuda, and that the *North Carolina* and three destroyers have arrived at St. Johns. The British Admiralty is daily informed through the consular service, and other channels, of the movements of war vessels, and it has, at times, proved embarrassing to me to receive information of our own vessels' movements from the Admiralty.

In the meantime Admiral Mayo had arrived in London. The question of the disposition of these forces at the Azores was taken up by him, and on August 29 he sent the following message to the Navy Department:

AUGUST 29, 1917.

To: Opnav, Washington.

396. After discussion with Admiral Jellicoe, Admiral Beatty, and Vice Admiral Sims, recommend send one division submarines operate against enemy submarines vicinity Azores, with monitor tender, base Fayal, where monitors' guns furnish local base defense. Tender should be prepared lay net in Horta Harbor entrance from

Digitized by Google

breakwater end. Following 20-fathom curve towards signal station, submarines and tender should be attached to naval forces in European waters.

After arrival submarines, Azores destroyer division one proceed operate from base Brest, stopping Queenstown en route for instruction. *Panther* also proceed base Brest, where can assist in yacht upkeep, provided another destroyer tender available for upkeep destroyers home waters 15429.

MAYO.

In reply, the department cabled Admiral Mayo, on September 1, in their 298, that his recommendation would be carried into effect. It is rather significant to note that, here again, the recommendation referred to was the same one that I had made in July—that is, that submarines should be sent to the Azores to operate against the enemy submarines, and that our destroyers should be brought immediately to the critical area. This message of the department to Admiral Mayo was confirmed in two dispatches sent to me four days later, on September 5:

SEPTEMBER 5, 1917.

Opnav 328. In about two weeks, and upon arrival of *Truxton* and *Wheeling* at Azores Islands, *Panther* and division one destroyer force will be directed to proceed European waters to be disposed of as per cable 396 from Admiral Mayo. 16000.

BENSON.

From: Chief Naval Operations.
To: Commander naval forces European waters.
Cablegram received September 5, 1917.

Opnav 340. Our 328 by 2d of October Azores Islands force should consist of one division of submarines, U. S. S. *Tonopah*, yacht *Atlantic*, U. S. S. *Whipple*, and U. S. S. *Truxton*. Radius of action will extend to Canary Islands. All forces will be under your general instructions, but we do not wish U. S. S. *Whipple*, U. S. S. *Truxton*, or *Atlantic* moved from this general area.

Issue instructions in keeping with above and you 396, so that U. S. S. *Panther* and division our destroyer force may sail shortly after arrival of U. S. S. *Whipple* and *Truxton*. 10006.

ADMIRAL BENSON.

It is to be noted in these messages that in the first message the department indicated its intention of sending two more older destroyers to replace those at the Azores, and that in the second message, announcing the addition of a division of submarines, it was specifically stated that, while these forces were under my general directions, the ships should not be moved from this area. The whole situation with regard to these forces and their command was still so unsatisfactory that, on November 5, in my letter report, I again reverted to the matter in the paragraph which I will quote you:

Letter 7305 November 5, 1917. Azores forces:

The force at present at the Azores consists of the U. S. S. *Wheeling*, *Truxton*, *Whipple*, and four submarines of the K class. These forces are apparently under the immediate command of Commander H. W. Osterhaus, United States Navy, commanding officer of the *Wheeling*, in his capacity of senior naval officer present.

I should consider it desirable, however, to bring to the attention of the department the somewhat unsatisfactory situation from the military point of view that exists with respect to this force.

On August 29, Admiral Mayo cabled to the department concerning the Azores force (cable No. 396), stating in part as follows:

"Submarine and tender should be attached to naval forces in European waters."

The department, on the 31st of August (cable No. 298), stated:

"The disposition recommended in your cable No. 396 approved."

It was understood by both Admiral Mayo and myself that the department intended to place the Azores force under my command.

Digitized by Google

On September 6 the department (cable No. 340) stated the proposed composition of the Azores forces, and stated:

"All forces will be under your general instructions, but do not wish U. S. S. *Whipple*, *Truxton*, or *Atlantic* moved from this general area."

On October 22 the department sent cable No. 799 to me, and to the *Wheeling* for the commander of the submarine force, giving certain information regarding conditions at the Azores, and stating as follows:

"Force now there will be based at Ponta Delgada and operated along such lines as you may deem best. Senior naval officer present there will be informed of any future additions to submarine force in case any are contemplated."

As this message left me in great doubt as to the exact desires of the department regarding the Azores command, I sent the following cable on October 23:

"No. 1035. Part of message relative to operations not clear. I assume all forces, including submarines, will be under my orders; that Capt. Robison will remain as senior officer, Azores, and operate all forces under my direction, subject to department's wishes."

To which the department replied as follows:

"Opnav. 340. Capt. Samuel S. Robison has planned for operation of his force in Azores. Senior submarine commander will naturally keep you informed, and will be guided by your instructions. Azores force is within limit of your command, and all forces there will be under your general directions. Very probably, in the near future, a group of destroyers assigned to troop convoy work may be based on the Azores. You will be informed of any intended additions to Azores force as soon as additions are made. It is not the intention to keep Capt. Robison permanently at Azores, but later on an officer of suitable rank will be ordered, probably a rear admiral, as base commander. You will be informed of the detail when it is made."

It appears, from careful consideration of the foregoing correspondence, that the Azores force is within the limits of my command; that it is under my general direction; that the senior submarine commander will keep me informed regarding the plans which have apparently been made by Capt. S. S. Robison; that he will be guided by my directions, and that an officer of suitable rank, probably a rear admiral, will eventually be sent to Ponta Delgada as base commander.

I wish to represent to the department that the situation thus created is not a satisfactory one from the military point of view, and that it should be corrected by placing the Azores force under my orders without reservation or restriction. The department must, of course, presume that I will not hamper the senior submarine officer by such detailed orders as would check his initiative and reduce his area of discretion below what it should be.

I recognize, of course, that this is rather tedious work, but as it illustrates one of the most complete examples that I have ever known of trying to run even intimate details of a campaign from a distance of several thousand miles, it is necessary to go into it to prove the points made in my letter.

In later letters and dispatches I again emphasized the embarrassment and difficulty which had arisen as a result of sending this force to the Azores without having arranged ahead of time for their repair and supply facilities without having undertaking the necessary diplomatic steps to insure cooperation on the part of the Portuguese authorities. Thus in my letters of September 7, 1917, November 15, 1917, and February 11, 1918. I will read short extracts from those letters. [Reading:]

6. AZORES DETACHMENT.

Letter 495, September 7, 1917:

The commander of the Azores detachment has reported to me a number of petty difficulties which have arisen with the Portuguese authorities, for example, that export taxes for supplies purchased by our forces and harbor dues are charged each time a destroyer gets under way for patrol duty. I have taken up this matter with the embassy in London, and requested that the embassy in Lisbon be asked to take such steps as may be possible to remove these minor difficulties which, incidentally, are discriminations, as they are not applied to British naval forces operating in the vicinity of the Azores.

Digitized by Google

7. FORCES BASED ON AZORES.

Letter 2629, November 15, 1917:

Copy of a report dated October 10, submitted by the senior officer at the Azores, direct to the department, has been received.

It is considered very necessary that the negotiations with the Portuguese Government should be prosecuted with a view to improving the cooperation between our forces and the local Portuguese authorities. It is noted, in the report from the Azores, that Portuguese authorities do not cooperate freely with our forces; and, in fact, withhold military information from them. Further, that great difficulty is experienced in arranging for stowage on shore for necessary supplies and an entirely unnecessary amount of red tape is involved in handling and actually obtaining the supplies for use. It is noted that before gasoline could be landed the local authorities considered it necessary to communicate with Lisbon. These are intolerable conditions. The question of military control should be definitely cleared up. It is also noted that our senior officer at the Azores has been informed by the local authorities that the Portuguese themselves are planning to protect the harbor with nets.

8. AZORES.

Letter 8749, February 11, 1918:

Referring to the inclosed report, from Commander Osterhaus, on the fortifications at Ponta Delgada, the question arose recently in one of the daily conferences of the admiralty staff, as to the extent to which the United States would contribute to the defenses which are obviously inefficient.

The force commander has been informed by the department of the dispatch of two 7-inch guns and a company of marines to Ponta Delgada, but was not advised as to the arrangements that had been made with the Portuguese Government regarding the manning of these guns. A cable inquiry addressed to Rear Admiral Dunn brought the reply that one gun was being mounted near the radio station, and one at Ponta Delgada, that the work was being pushed as rapidly as possible, and that the Portuguese had insisted on manning the guns. This, Admiral Dunn stated, had been promised them when they had been sufficiently instructed and had become proficient.

It is very earnestly recommended that our Government come to an understanding with the Portuguese Government, if it is at all possible to do so, by which the manning of these guns shall be entirely in our own hands.

I think this case well illustrates the manner in which the department acted upon various information, received by it in Washington, independently of my recommendations, and how my recommendations were put into effect only after they had been later reiterated by Admiral Mayo. It demonstrated how effective the German propaganda was, that the bombardment of an outlying port in the Azores could induce the department to divert forces of exactly the character which the Germans desired and intended by such a diversion. I remember following the German press at a later period, when Monrovia in Liberia was similarly bombarded, the general theme being to demonstrate how Germany was actually controlling the sea with her submarines, pointing out that they were proceeding where they pleased, bombarding ports, and that the Allies were powerless to prevent them.

To take an extreme case, for the sake of illustration, if every time the enemy detached a single submarine and sent it off into some remote locality to shoot up an undefended beach, we made a redisposition of our forces, or detached a comparatively large force to proceed there in reply thereto, the submarine campaign would have been still more threatening.

I am citing these cases merely to show the repeated violation of fundamental principles of warfare; for one of the most universally accepted principles of strategy is involved, namely, that of concentration. Many other cases could be brought in to show that.

Digitized by Google

although the department agreed in theory to the policy which I had recommended, especially that of the concentration of forces, I continued to receive, well into 1918, many similar proposals for the diversion of our forces, to meet sporadic submarine activities, aimed at this very end, that is, to force us away from the principle of concentration. This was the point referred to in No. 5, of my summary of conclusions, in the letter which has led to this investigation.

To take one more instance of this attitude on the part of the department: On the 13th of February, 1918, I received from the department a dispatch (their No. 2977) calling my attention to the fact that the German submarines had recently been active in the vicinity of the Canary Islands, and suggesting that we send forces to that area to establish a patrol of the waters about these islands. I discussed this matter with the representatives of the Allies, in accordance with my instructions, and on the 15th of February sent the following message to the Navy Department:

VERY SECRET.

4016. Your 2977. By agreement with French Ministry, when our forces were sent to the Azores, we were to avoid waters south of 30° and east of 20°, since the French had forces in the Canary Islands. British submarines have recently been dispatched to the vicinity of the Canaries, in consequence of enemy activities.

As I previously explained, it is extremely dangerous to put submarines of different nationalities in the same area without their previously having orders. [Continuing reading:]

I do not consider that, with the limited number of units at my disposal, any effective patrol of the Canaries and vicinity can be established, and that to establish an ineffective patrol is merely a waste of effort. Furthermore, if forces are drawn from Azores to patrol Canaries region, the enemy would doubtless transfer his activities back to the Azores. I therefore recommend no change from present disposition of forces, on account of enemy activities in vicinity of Canaries.

SIMS.

In a letter to Admiral Benson, on February 18, I wrote:

FEBRUARY 18, 1918.

TO BENSON:

Referring to your cablegram, concerning the advisability of sending the Azores force down to the Canaries, to suppress the activity of the cruiser submarines in that neighborhood, the whole subject was discussed at length at the usual morning council at the Admiralty, and we all came to the unanimous conclusion which was embodied in my reply.

As will be seen from this cable, not only was such a dispersion of forces on our part inadvisable, from a military point of view, but it was unnecessary, because Allied forces, already operating in that vicinity, from bases previously established, were ample to meet the situation; that is, to deny these islands to enemy submarines as havens for resting their crews, making minor repairs and so forth. In spite of this recommendation, I find that six weeks later the department was again suggesting the establishment of bases, and the sending of forces, this time not to the Canary Islands, but to Madeira and to the Cape Verdes, still further afield. Their message was as follows:

Cablegram received April 2, 1918.
Origin, Washington, Ser. No. 4487.
Simsadus.

4487. Presence of hostile cruiser submarines around Canary Islands and Cape Verde, operating as indicated in the estimate by your planning section, coupled with recent

Digitized by Google

requests to run sailing vessels to African coast, through the zone for lumber, leads the department to look with favor upon the establishment minor bases of our own, at Madeira islands and Cape Verde. As bases from which a few of our submarines might operate, assisted by heavily armed cruising craft of the P or Q type, these islands seem to present possibilities. Matter has been taken up with Portuguese authorities, through our State Department, but has not progressed to a decision. What is opinion of Admiralty as regards feasibility of such a scheme, and, if considered feasible, what pressure can Admiralty bring to bear to further it, provided United States agrees to furnish operating craft, and to make scheme merely an extension of present Azores Islands operations. 22001/4487.

BENSON.

(At this point, at 12 o'clock M., the subcommittee adjourned until Monday, Mar. 15, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

MONDAY, MARCH 15, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman) and Trammell.

STATEMENT OF ADMIRAL WILLIAM S. SIMS—Resumed.

Admiral SIMS. When the hearing ended Saturday I was discussing the attitude of the Navy Department in sending reinforcements to such places as the Azores and Madeira, the Cape Verde Islands, and such places in the Pacific, and there is a little more I have to say on that same subject.

The department was so insistent upon instituting operations in these areas that I further took up the question with the Allies and, in order to try to meet the department's wishes, I sent a further message on April 7, reporting that I was considering the plan outlined by the department, and on April 10 I sent the following message, giving the conclusions reached:

VERY SECRET.

6314. Your 4487. My 6151. Madeira appears to offer no facilities as a base for submarines. In the Cape Verde Islands harbors are poor, but probably Porto Grande would be best place. It is not regarded as feasible to base submarines in a locality where there is no secure harbor, as is the case at Madeira and Cape Verde Islands. It is suggested that department consider basing submarines at Dakar, where excellent base facilities belonging to French already exist. I am not convinced that submarines based at any one of the three places mentioned would be better employed than on the home coast, where defensive operations may be required against cruising submarines. 6314.

SIMS.

It will be noted that I again expressed my doubt of the advisability of any such use of our submarines, stating that they would be of more use to meet the submarine raids on the American coast, which at this time it was considered would not be long delayed.

I might also add that I always encountered a tendency on the part of the Allies to avoid disagreements with our Navy Department. It was natural that they should show a desire to acquiesce in departmental suggestions as far as possible, or at least not to be found at all times in opposition to them.

Digitized by Google

To show that I had tried to state fully the situation in this outlying area, I will quote the following from a letter of December 19, 1917:

10. SITUATION AZORES.

The situation at the Azores remains unchanged. One large enemy submarine is operating in the general vicinity, and another is probably at sea en route. These submarines are believed to be the *U-152* and *U-157*.

The large areas involved, and the large cruising radius of these submarines, will always render any patrol system entirely out of the question.

The danger in these waters is so slight, compared to that in the vicinity of the British and French coasts, that it is urgently recommended that the force at the Azores be kept at a minimum, unless very marked changes in the enemy submarine campaign occur. It is considered that the Azores forces can not be expected to do more than deny these islands as an enemy base, and to hold themselves in a constant state of readiness to proceed on independent operations whenever a submarine is known to be within close enough proximity.

It is desired to point out that the Azores can never be considered as an efficient base for antisubmarine craft without a dry dock.

Destroyers are constantly laid up, owing to bent propellers, and if we attempt to base destroyers at the Azores, the necessity would constantly arise of sending vessels to Gibraltar or Queenstown for docking.

If the department intends to prepare the Azores as a possible future base, immediately steps should be taken to provide a floating dry dock. So long as shipping is kept away from the Azores, it is most unlikely that submarines will appear in that area.

As a matter of fact, the department's action, in allowing antisubmarine craft to be wasted, for the periods above mentioned, in such areas as the Azores, is susceptible of being converted into terms of actual unnecessary loss of life and wealth.

While some of the incidents narrated occurred considerably more than six months after our entry into the war most of them occurred during the first six months—the period to which my letter of January 7, 1920, principally related.

On October 2, 1917, I received the following cablegram from the Chief of Naval Operations:

SIMSADUS:

571. You are authorized to redistribute the naval forces under your command to meet such changes as may arise in European waters. Every redistribution of your command shall be made with a view not only to meeting the military situation but also with a view to foster feelings of harmony among the Allies concerned. Evidence of dissatisfaction on the part of one or more of the Allies with a proposed redistribution shall operate to prevent such redistribution until you have adjusted the matter to the satisfaction of all concerned. In case not yielding to adjustment submit plan your views and the views of the Allies concerned to department and defer action. No redistribution of forces shall be directed against the forces of any other power than Germany. 19001.

That last proviso was on account of our not being at war with Turkey.

Of course, we all know that history is full to overflowing of explanations of failures in military operations, owing to exactly identical cases to those I have described, namely, violations of such fundamental principles as decentralization of command, which affords commanders in the field the wildest possible area of discretion, and above all the fundamental principle of concentration. As for the question of unity of command, I will leave that to the committee's own conclusions. The facts speak for themselves. I would merely add one point, and that is that it is quite possible to point out in extenuation or explanation of our own departmental errors, similar instances in the case of the Allied Governments.

Digitized by Google

The reply to this is that allied operations are not here under discussion. It was my aim throughout the war to insure not only that we should profit from allied successes and experience, but what was equally important that we should profit from their errors. It was a game of learning how not to do it as well as how to do it. As I pointed out, in dealing with the question of cooperation with the Allies with regard to aviation, in a message which I sent to the department on the 21st of April, 1917:

I have had thorough consultation with aircraft commission.
They are willing and anxious to give us anything and help development in any way. Their experience in design and construction, as well as operation, has been bitter and gained by blood and tears. We should profit by their mistakes and not repeat them.

Questions of national defense are so well understood and their vital nature so fully appreciated abroad that a premium is placed upon free and open criticism, which can be found not only in the public prints but heard on the floor of their congresses day after day. For every instance which I could cite, or which could be brought up with the object of justifying our own errors, I could turn to the foreign press and find dozens of similar cases. I doubt if to-day foreign navy departments have escaped free and open criticism on a single phase or possible error of the war. As witness, for example, the discussions of the Battle of Jutland, in which the British Admiralty, as well as the commander in chief, have been subjected to a degree of violent criticism and condemnation which would startle this committee.

IMPRACTICABLE PLANS OF THE DEPARTMENT BASED ON INCOMPLETE INFORMATION.

If I may refer back again to the summary of conclusions in my letter of January 7, 1920, I would again invite attention to my point 8, in which I said:

The Navy Department made and acted upon decisions concerning operations that were being conducted 3,000 miles away, when the conditions were such that full information could not have been in its possession, thus violating an essential precept of warfare that sound decisions necessarily depend upon complete information.

One of the most striking illustrations of this point, and a case in which the action of the department might have had the most disastrous effect, occurred in the case of the first convoy of troops sent to Europe in June, 1917. Since the early part of May, 1917, I had been receiving unofficial information, in personal letters from officers in the Navy Department, from armed guard officers, from Army officers, and from allied officers, to the effect that a convoy of American troops was almost immediately to be sent to Europe. I of course expected that the department would give me full and complete information concerning any plans for troop convoy, and would, in preparing the plans for the transport of these troops, utilize all of the available war experience in the transport of troops overseas which the Allies had acquired after nearly three years of such operations; but no request from the department for information as to allied methods, and no request for recommendations as to how the convoy could best be protected in the war zone, reached me until plans had been definitely completed in Washington for the sailing of the convoy.

Digitized by Google

As an illustration of how completely I was in the dark as to the probable movement of these troops and the method to be used in handling them, I may say that I received information from both British and French naval authorities concerning the convoy before I was officially informed of it by the department. Furthermore, the tentative regulations providing for all the details of the handling of troop convoys, including their protection in the war zone, which were agreed upon by the War and Navy Departments on the 26th of May, 1917, signed by Gen. Bliss and Admiral Benson and approved by Secretaries Baker and Daniels, and further approved by the President on May 27, 1917, were not known to me, nor did I receive a copy from the department until the 30th of October, 1917; that is, five months later. I submit a set of these regulations for the record, but consider it unnecessary to quote them here.

(The regulations submitted by Admiral Sims are here printed in the record, as follows:)

[Received by Admiral Sims, Oct. 30, 1917.]

TENTATIVE REGULATIONS FOR THE TRANSPORTATION OF TROOPS TO EUROPE.

1. The following rules supersede for the time being all previous regulations for the government of the naval convoy of military expeditions to Europe.

2. All matters relating to the purchase, charter, fitting out, equipping, and maintenance of transports, engaging their officers and crews, and providing rules for their government and their interior disciplinary administration shall be controlled by the Army, except that all regulations concerning the security and defense of the vessel and the safety of all persons on board, both at sea and in port, shall be prescribed by the Navy.

3. All matters relating to the loading of troops, animals, or stores upon transports and the quota of cargo to be assigned to each such vessel shall be under the charge of the Army.

4. When an overseas expedition requiring naval convoy has been decided upon, a naval officer of suitable rank shall be appointed as convoy commander. He shall be furnished full information concerning the strength of the expedition and its proposed objective. The Army authorities shall afford him adequate facilities for inspecting the transports as they assemble for the purpose of ascertaining whether they are properly armed and equipped for defense, fitted with ground tackle, boats, life rafts, life preservers, lines, and all equipment necessary for the proper management and control while in transit or while disembarking men and animals, under the conditions which will be probably met. The convoy commander shall call the attention of the Army commander to defects or deficiencies with respect to such matters, and the Army commander shall use every effort to remedy such defects or deficiencies in accordance with the judgment of the naval convoy commander. The naval convoy commander shall render all possible assistance with the resources at his disposal. In the event that it be found impracticable to remedy the defects or to suppy the deficiencies, which, in the opinion of the naval convoy commander will, if allowed to continue, threaten the safety of the convoy or jeopardize the safety of the expedition, the matter shall be reported immediately to their respective departments by the Army commander and the Navy convoy cammander.

5. The naval escort for each group of transports shall consist of not less than one cruiser throughout the entire voyage. The escort shall be augmented in special areas so that the naval force available shall render the maximum protection to the convoy throughout the voyage.

6. Each transport shall be armed by the Navy with the minimum of four guns, of not less than 3-inch caliber, and shall be equipped with an efficient fire control and lookout system, including suitable glasses for lookouts.

7. An officer not below the rank of lieutenant commander in the Navy, and two other experienced officers together with a suitable number of quartermaster and signalmen, radio operators, and a full gun's crew for each gun, shall be detailed to each transport by the Navy Department. The means for making flag, semaphore, and wig-wag signals by day and by night shall be provided by the Navy Department.

8. (*a*) The order as to destination of the convoy and time of sailing shall be issued by the naval convoy commander after the Army commanding officer, under authority of the War Department, has stated that he is ready to sail. The orders of the naval

Digitized by Google

convoy commander shall be immediately communicated to the Army commanding officer. Should circumstances arise after sailing, which render a change in plan or destination necessary or desirable, which change is not practicable to refer to higher authority, the naval convoy commander shall, after consultation with the Army commander, decide as to such change.

(*b*) The naval convoy commander shall have control of all movements of the convoy and shall prescribe all orders of sailing and formation. He shall make provision for emergencies, such as an attack by an enemy, or a dispersion of the convoy by weather or other circumstances.

(*c*) The naval convoy commander shall assure himself that his subordinates, placed on the transports and supply vessels, are familiar with dispositions and plans.

(*d*) Should the transports be separated from the convoying vessels by accident or design, the senior naval officer present and on duty shall take charge of the convoy and control its movements in accordance with the plans of the convoy commander.

9. (*a*) The senior naval officer attached to the transport shall at all times, both in port and at sea, have complete command of the transport in all matters relating to speed, course, maneuvering, anchorage, and the defense of the vessel. He shall act in accordance with the instructions issued to him by the naval commander (convoy). He may call upon the commanding officer of troops for officers and men for any duty connected with the security and defense of the vessel or her personnel. The commanding officer of troops will detail officers and men in the numbers requested, and officers and men so detailed shall perform the duties for which their services are requested, under the direction of the senior naval officer on board.

(*b*) All signaling and all radio shall be under the complete control of the senior naval officer on board.

(*c*) The senior naval officer on board shall be responsible for the exercise of the passengers and crew of the transport at fire quarters and abandon ship.

(*d*) The master and officers of the vessel shall perform their navigation duties affecting her speed and movement, under the direction of her senior naval officer on board, and should there be any opposition to or interference with his authority in any way, he may call upon the commanding officer of troops on board, who shall then take such steps with the forces under his command, as may be necessary to enforce the authority of the naval officer attached to the vessel.

10. The authority of the senior naval officer on board shall be limited to those matters above enumerated.

11. The time and place of landing shall be determined by the naval commander, after consultation with the Army commanding officer. The order of landing shall be determined by the Army commanding officer, after consultation with the naval convoy commander. After the order of landing has been known to him, the naval convoy commander shall control the disembarkation of men and material.

12. It is deemed desirable that the Army commanding officer if convenient, shall be embarked in the flag ship of the naval convoy commander. If not convenient, the Army commanding officer's transport shall be near the flag ship of the naval convoy commander, in order that communication between them may be readily had at any time, and in this case the senior naval officer assigned to transports should be embarked in the same transport as the Army commanding officer.

W. S. BENSON,
Admiral, U. S. Navy,
Chief of Naval Operations.

TASKER H. BLISS,
Major General, U. S. Army,
Acting Chief of Staff.

Approved May 26, 1917.

JOSEPHUS DANIELS.
BAKER.

Approved May 27, 1917.

WOODROW WILSON.

On June 6, 1917, the first information that I received from the department with regard to these first troop convoys, was contained in the following message, sent but three days before they were scheduled to sail:

[Very confidential.]

Received: June 6, 1917.
From: Secretary of the Navy, Washington.

A convoy of American troops to France will sail about the 9th of this month. It is now contemplated to despatch four convoys, in groups of three or four transports,

Digitized by Google

under separate escort. The first three groups have troops, and sail at about six hours interval. The first groups are of faster speed. The fourth group, bearing animals, will sail last, and may be delayed. All of the groups sail for a meeting place at sea, location of which you will be informed of later. The meeting place will be reached, by the first group, about one week after sailing. The third and fourth groups in about nine days. I will advise you later of the dates and hour of sailing, and of arrival at the meeting place.

I hereby instruct you to furnish escorts, to consist of one division of destroyers for each convoy group, from the point of meeting to the port of debarkation. When this escort duty is finished those detailed to this service will be returned to their present service. Rear Admiral Gleaves will accompany the first group, in *Seattle*, and will have command of all operations of convoy.

DANIELS, *Secretary of Navy.*

It would be impossible to find a more striking example of the department's insistence upon making decisions based upon incomplete information than is provided by this message. The whole scheme of troop convoy outlined in this message showed a complete ignorance and disregard of convoy methods and of war experience in the submarine danger zone. The action of the department in giving me definite and detailed orders from Washington as to how the convoy should be handled in the danger zone and as to what escort each group should have exhibits a disregard of the fundamental military principle of command which requires that subordinate commanders shall be allowed to exercise their initiative in their own fields in carrying out the mission assigned to them. The department not only assigned me a mission, but, as will be noted in this case, practically dictated the orders which I should issue to the vessels under my command. This I pointed out to the department in my cable of June 8, 1917, in reply to the message I have just read you. This message was as follows:

[Cable Dispatch.]

Sent: June 8, 1917.
To: Secretary of the Navy (Operations).
Through: State Department.

11. Escort and convoy duty within danger zones is performed in accordance with experience, and each case is dependent upon disposition of allied forces at time and latest information concerning enemy activities. Generally speaking, duty is carried out in relays, ships escorting only in their assigned areas and passing on the convoy to ships of next area on the route of the convoy. As our destroyers generally operate farthest to westward, we participate in majority of escort duty. In view of above, suggest that in future the number and nationality of ships to be detailed for escort duty be not specifically ordered by the department, but be determined here, dependent upon the disposition of allied forces and circumstances at the time of arrival at appointed rendezvous. Such a course will not only facilitate convoy duty, but also other military operations of submarine campaign.

SIMS.

The department, in reply to my dispatch which I have just read you, cabled me as follows, on June 10, 1917:

Received: June 10, 1917.
To: Alusna, London.

Department considers it essential, on account of the present sensitive public opinion, that the escort orders for the first convoy, already issued, be executed by our own destroyers. The soundness of your recommendations are recognized by the department. For subsequent convoys, not more than three transports in one group with escort of not less than one cruiser and three destroyers per group is the present policy of the department. Please write giving outline plan for handling the Euproean end of the escort duty for further convoys and mention the numbers and types of vessels likely to be assigned to escort each group of transports throughout each section of the danger zone. 21009.

DANIELS, *Secretary of Navy.*

Digitized by Google

It is to be noted in this message that the department, although recognizing the soundness of my recommendations, still persists in the first plan outlined in its previous cable. I was now asked for the first time to write the department outlining a plan for handling the European end of the escort duty for further convoys. That is, my recommendations were sought with regard to this very essential and important duty as commander of our forces abroad only a week before the sailing of the first convoy. On June 12, 1917, I replied to the message of the department with the following:

[Cable dispatch.]

Sent: June 12, 1917.
To: Secretary of the Navy.

21. 21009. Letter follows next mail. Necessary for safety that, for future troop convoys, rendezvous and routes be designated and controlled from here based upon latest information enemy activity. Initial orders, on sailing, should be subject to change by radio, after sailing. Troop ships should zigzag together, two to four point changes, irregularly. Destroyers should zigzag independently, avoiding regularity of position in reference to convoy. In accordance with British experience, when escorting cruiser enters dangerous submarine zone, she is of practically no protection to convoy, and virtually becomes one of convoy. It is necessary in danger zone that radio be not used, except for most important messages. Evidence indicates that radio direction finders have been able to locate large forces if radio work of distinctive nature. While in zone, experience indicates that convoy commander should leave maximum initiative and freedom of movement to senior destroyer commander, in view of his recent experience, and later knowledge of methods. Enemy submarines do not have beam tubes. Line "column" (this word should probably have been "division") recommended, with force concentrated as much as consistent with zigzagging, this to reduce visibility of the force and facilitate offensive operations of destroyers. It is now practice here to furnish escort of one destroyer for single troop transport, three for two transports, four for three or four transports, and one destroyer per transport when number is greater than four.

SIMS.

On the following day, June 13, 1917, I sent to the department the letter referred to in the cable, outlining for the department the war experience in troop transports, and making definite recommendations as to how American troops should be transported and protected in the war zone. It will, I think, be unnecessary to read you this letter. I have a copy of it before me, which with your permission I will insert in the record, to show that the department, in this case as in every other instance in which it called upon me for recommendations, was provided with all the information available; and the recommendations, which were drawn up only after a conference with the heads of the allied navies.

The letter referred to is as follows:

[Letter No. 1.]

OFFICE VICE ADMIRAL, COMMANDING,
UNITED STATES DESTROYER FORCES,
EUROPEAN WATERS,
London, June 13, 1917.

From: Vice Admiral Wm. S. Sims.
To: The Secretary of the Navy (Operations).
Subject: Convoy operations in submarine danger zone.
Reference: Department's cable 21009.

1. With reference to the department's cablegram 21009, concerning methods of protection future convoys of troops or supplies for our Army and Navy forces while in submarine danger zone.

2. The governing considerations in the question of escorting through the submarine zone are:

(1) Latest information concerning enemy activity.

Digitized by Google

(2) The question of not entirely abandoning our own offensive campaign in favor of escorting duty, and

(3) The question of the number of craft available for such duty and their disposition.

If, for example, enemy activity is concentrated to the westward of Ireland and convoys are coming in well to the southward of this area, it manifestly is important to concentrate our offensive campaign in the area in which the enemy can be most effectively attacked.

In deciding as to the number of types of ships to be diverted from offensive operations preference is always given, of course, to convoys carrying troops. Convoys carrying material, whether it be munitions, animals or food supplies are escorted whenever necessary; but such escorting duty is not allowed materially to interfere with the offensive campaign in operation at the time in question.

3. In those areas which are constantly being covered by destroyers or other antisubmarine craft, such as sloops (specially built antisubmarine vessels, about 1,200 tons), the attempt is made to avoid taking such vessels out of their designated patrol squares. The vessel, or vessels, which first picks up a valuable cargo escort it through her square, notifying the patrol vessel on the next square, inshore, and turning over to her as soon as the meeting of the ships is effected. If by reason of thick weather, etc., contact is not made, the convoying vessel continues on the next square.

4. The routes which will be followed by our troops and supply ships bound for France are, generally speaking, outside of the main areas of submarine activity, and hence outside of the areas continuously patrolled by destroyers and other antisubmarine craft, except for a short distance off the west coast of France.

5. For the purpose of handling such convoys, and also the merchant shipping convoys which are now in operation from Hampton Roads to the Mediterranean, the Admiralty have established, for convenience to their own administration, a comparatively large number of rendezvous well out at sea, and encircling the British Isles and west coast of France. Also a comparatively large number of locations on the Irish, English, and French coasts have been given designating figures or symbols. It will therefore be the practice each time that one of their convoy sails from a foreign port, to designate a rendezvous which they are to pass through, and a point on the coast which they should steer for after passing through the rendezvous.

This requires a notification well in advance giving as closely as possible the time that convoys will pass through the rendezvous points designated. Escorting destroyers will then be able to intercept the convoys at some point on the route between the rendezvous and the point designated on the coast, the position of interception depending primarily upon enemy activities at the time. It manifestly must also be possible to communicate in cipher with convoys at sea and divert them from one rendezvous to another, if occasion demands.

The above-mentioned lettering and numbering of rendezvous and points on the coast are, as stated, primarily for convenience of reference in administration in the Admiralty itself.

The significance of such symbols if circulated even to our own allied officers abroad must necessarily be limited to the maximum extent in order to preclude any possibility of the enemy becoming aware of them.

6. If the greatest possible degree of safety for convoys is to be insured, it is entirely necessary that their movements should be under control of one source, and therefore as all enemy activity is concentrated on this side of the Atlantic, and his main effort must necessarily remain in its present zone, it follows that selection of rendezvous routes and other directions in regard to movements of convoys should be controlled and directed from this side, that is, in the Admiralty itself. It is for this reason that the Admiralty has requested, and I strongly recommend, the immediate detail of a competent and tactful officer whose duties in the Admiralty under my general direction will be confined to those above indicated.

7. The following procedure in regard to convoys is therefore recommended:

(1) Early advance information regarding prospective sailing of convoys and their character.

(2) Immediate information as soon as definite hours of sailing can be foreseen.

As soon as this information is received, and after consultation with the Admiralty, a rendezvous and route to be included in sailing orders will be selected and given. Definite information should then be given when convoys sail, as to its prospective speed and time of passing through rendezvous designated.

8. It is urgently requested that only British Admiralty codes be used for such communications, addressed to the Admiralty, the first word of the message being "Sims."

9. Under no circumstances, if convoys are divided into groups, should these groups use the same rendezvous and the same routes after reaching the danger zone, as in such a case if the enemy should become aware of their movements he would be able to concentrate for successive attacks.

Digitized by Google

10. Ships of convoy should zigzag together from two to four points irregularly. Organized irregularity is one of the principal requirements in opposing submarine attack.

11. Escorting destroyers should be allowed the maximum independence of movement and the exercise of initiative. They should not be held to strict formations in reference to bearings and distances from the convoy. This procedure is necessary in order that full advantage may be taken of their experience in operating against submarines and their later information in regard to enemy methods, which are continually changing.

12. It is mandatory that the wireless shall be used as little as possible. In fact, it would be better not to use it at all, except for important directions which may have to be sent from shore as to changes of routes. Evidence indicates that the enemy has been successful in the use of radio direction finders, particularly in locating large forces of radio work of an unusual or distinctive character.

13. It is apparent that once a convoy enters the danger zone an escorting cruiser is of little or no protection against submarines, and virtually becomes one of the convoy itself, also requiring protection.

14. Up to April 1 there is no evidence to indicate that any German submarine carried beam tubes, and this is one of the principal reasons why they have never attempted attacking a formation from ahead—that is, approaching from ahead and firing as they pass through the formation. With bow tubes they would be forced to use the helm before reaching the formation, with considerable danger to themselves, which they seldom, if ever, incur. Hence the principal arc for destroyer protection is on the bows and wings of formations.

15. The two principal requirements of formations of a considerable number of ships for defensive purposes against submarines are:

(1) Minimum depth of formation—that is, minimum length of formation in the direction of course. This in order to reduce the arcs on the bows and beams, which must be protected by destroyers.

(2) The second consideration is to concentrate the formation as much as possible—that is, it is also necessary to reduce the dimension of the formation at right angles to the course.

This not only reduces the range of visibility of the force, but it also restricts the advantageous positions of attack which the submarine desires to attain.

It is for the above reasons that line of divisions formation is generally adopted, with the distance between columns as small as consistent with zigzagging evolutions.

W. S. SIMS.

In further cable, sent on June 14, 1917, I again called the attention of the department to the embarrassment caused by the plan, which they had ordered carried out, for the handling of this first convoy. The pertinent paragraphs of this message are the following.

You will see, before I get through, that it was one of the most dangerous operations we had to conduct during the war, and God was good to us that we did not lose any of those ships. [Reading:]

June 14, 1917:

There are not now sufficient vessels available for escort duty to insure safety of all vital supplies and also prospective movements of our troops and their supplies. As our troops and their supplies will approach European coast outside of zones used by shipping and shipping convoys, it is mandatory that information be given immediately as to the probable numbers and times of sailing of all Army shipping in next three months, as on this depends the program of merchant ship convoys, which must be arranged some time ahead. The approach of our first Army convoys will seriously embarrass the shipping situation, as it will require all destroyers based on Queenstown, thus necessitating entire suspension of patrol and escort duty in that area. I can not lay too much stress upon the urgent necessity of increasing the destroyer and other patrol forces here with utmost dispatch. * * * Urgently request answer in next 24 hours, if possible, as to prospective movements of all Army shipping in next two or three months. This information is of vital importance. Also request information as to probable additions to antisubmarine forces these waters. The Admiralty informs me that present prospect is that if oil supplies are protected food supplies can not be. I again urgently recommend that all destroyers that can be brought to the coast of Ireland be sent at once.

Digitized by Google

The same information was also conveyed to the department in my letters of June 15 and 20, which I have read in another connection, and which it is hardly necessary to repeat here.

I wish here to make one point perfectly clear, as it will be referred to later. There is no question, in these messages, nor was there any question at the time, as to whether troops should be given first call on protection, should get the very best protection that was available. They always did throughout the war; and it may be interesting to the committee to know that throughout the war American troops received more protection than the Allies were able to give their troops on the high seas. The point I was trying to make clear was that it was absolutely necessary that, in moving our troops, we bear in mind, at all times, the great importance of the saving of shipping, upon which the operations of these troops depended after they got abroad. I have fully covered this question of available tonnage in previous testimony. To save time, I will state an extreme case, merely for the purpose of illustrating the point at issue. If we had gone ahead and moved troops abroad as fast as ships could be found to carry them, and had done this with no regard to merchant shipping, we might easily have found ourselves in the position of having a large army marooned abroad, but helpless through lack of supplies: or, on the other hand, as I hope I have clearly shown, we might easily have lost the war, in the meantime, on the score alone of the loss of our available allied merchant tonnage, in spite of the number of troops in the field. Another point, which should probably be stated at this time is that, contrary to impressions which have been given in the press, there was never any issue between me and the department as to the fact that the primary mission of American naval forces was the protection of the necessary army, and Army supply movements.

Such a statement goes without question. It is very easy to confuse the issue in a case like this, in discussing it a long time after it happened; to disregard the time element and to confuse dates by merely omitting reference to them. The heavy movement of troops, in fact, what is now justly regarded as one of the wonders of the war, namely, the remarkable transport of American troops overseas, did not occur in the period we are here discussing. On the contrary, it was nearly a year later, as will be seen by reference to the Government statistics. The curve of the movement of troops was very low during these early months and did not commence to rise until about April, 1918.

On June 17, 1917, I received a detailed message announcing the sailing from New York on June 15 of three troop convoys, and giving me detailed instructions as to their movements on the high seas I will include this message in the record, but will not read it on account of its technical nature.

(The message referred to is here printed as follows:)

Received: June 17, 1917.
To: Vice Admiral Sims.
No. 20.

The convoys are arranged in groups.

Three groups sailed June 15 from New York.

Group one will arrive at 6 a. m., June 23, at first rendezvous, latitude 48–55, longitude 24.20.

Group 2 will arrive at 4 p. m., June 23, at first rendezvous, latitude 48–10, longitude. 25.

Digitized by Google

Group 3 will arrive at 6 a. m., June 25, at first rendezvous, latitude 46–46, longitude 23.65.

The French Admiralty will designate second rendevous and forward same to escorts viz United States destroyers sent by you to first rendezvous.

Group escort flagships:

Group 1, U. S. S. *Seattle*.

Group 2. U. S. S. *Birmingham*.

Group 3. U. S. S. *Charleston*.

The sailing date for group 4 will be communicated later.

This information must be sent most confidentially and immediately to naval attaché, Paris.

Acknowledge receipt of this message for Vice Admiral Sims. 12016.

DANIELS, *Secretary Navy*.

It informed me that two convoys would pass designated rendezvous on the 23d of June and the third convoy on the 25th. It further stated that the French Admiralty would designate the second rendezvous, and would forward the same to the convoys, via the destroyers, which I was to send to meet the convoys at the first rendezvous. It would be hard to imagine an arrangement more calculated to create confusion, or to disseminate more widely information as to the movements of these convoys, thereby exposing them to unnecessary dangers. It meant that information concerning their movements had been cabled to me in London, in a code which I had repeatedly told the department was unsafe; and, furthermore, that the same information had been cabled to Paris, apparently passing through numerous hands in Washington; and that it was left to Paris to select the second rendezvous, communicate it to me in London, thence to be passed along to Queenstown, and given to the destroyers, and carried by them to sea, for further transmission to the convoys. I will not tire the committee with a lengthy description of how impossible this plan was.

Suffice it to say that the safety of the convoys, once they got into the war area, was dependent upon the latest information of the enemy movements. At the time in question, I was in Queenstown, in temporary command of the British station at that point. I leave you to imagine my difficulties in trying to coordinate the plans for these first convoys, by messages over the cables to Paris, London, and Washington. It was difficult to know just who was in charge, and who was responsible. It was very easy to have a misunderstanding. I was unaware at the time how many forces the French could send, or had promised to send, to sea to meet these first convoys; and, further, I did not know what information the French had concerning the composition, speed, times of sailing, and number of destroyers to be supplied by me or from home waters. I was unaware of the forces which were to be sent from home with these convoys. I could, of course, have merely sat tight, carried out only the specific task assigned to me; that is, of sending the destroyers which had been prescribed. But I think it will be recognized that nothing could excuse me from doing everything in my power to straighten out the tangle in which the movement of these convoys was involved.

I realized that there was no time to be lost. In fact, before I could get word to the department, the convoys had actually sailed and were on the high seas. There was the possibility, in fact the probability, that the destroyers would not be able to find the convoys, or would be unable to reach the first rendezvous by the time the convoys got there. This would leave the convoys in a quandary on the high seas as to where to go next.

Digitized by Google

I therefore drove through a brief message as follows:

JUNE 18, 1917.

To: Secretary of the Navy.

Number 20 acknowledged. Please direct convoys to proceed from first rendezvous on course east, in absence of other instructions and until escort joins. They should use 600 meter wave length, and will receive instructions concerning rendezvous, or enemy, from Queenstown via Valencia, call sign G C K, or via our destroyers. Use Sigcode Cypher.

SIMS.

The reason for directing them to proceed due east from the first rendezvous was simply to avoid their arriving there without instructions as to where to go, and in order to make sure of the destroyers finding them. Their subsequent movements, after the destroyers had joined, I hoped to be able to straighten out before that time arrived.

I should also state, at this point, that war experience clearly proved that it was impossible for forces, destroyers or otherwise, to meet on the high seas at specific points. The explanation of this is a long story. It is involved in the inevitable inaccuracies of high seas navigation, particularly of the types of ships we were using, inevitable delays, due to casualties to machinery and weather conditions, which were always involved, etc.

On June 19, right in the midst of the trying hours we were going through, I received the announcement of the sailing of the fourth group in the following message:

Received: June 19, 1917.
To: Alusna.
For: Vice Admiral Sims. No. 21.

Convoy group No. 4, U. S. S. *Hancock* flagship, sailed June 17. Will arrive at rendezvous, with United States destroyers, latitude 47–40 north, longitude 23 west, at 6 a. m. June 28. Communicate this in most confidential manner to naval attaché, Paris. 14018.

DANIELS.

The last sentence of this message was confusing, because I was left in doubt as to whether the French were depending solely upon me for their information or were getting independent information from the department. I was further confused as to whether the department expected me to provide the destroyer escort for this last group or whether such escort was in the accompanying convoy. Previous messages had directed me to furnish escort. I therefore immediately cabled asking for this information.

In the meantime this convoy group was at sea, and it was nearly halfway across the Atlantic before I received from the department information as to whether or not I should furnish destroyer escort for it. On June 22, 1917, I received the following message from the department:

June 22.
To: Alusna.
From: Secretary of Navy.
For: Vice Admiral Sims 28.

Your 120. You are to supply destroyer escort for Army convoy groups 1, 2, 3, and 4. Please inform the naval attaché at Paris 19021.

No point would be served in going further with the detailed messages which were exchanged between London, Paris, Queenstown, and Brest concerning the movements of these convoys but, if they

Digitized by Google

were read it would be an impressive demonstration of how confusing the situation really was.

As quoted in my official letter of July 6:

* * * I would cite an incident illustrating the great danger of attempting to communicate with more than one headquarters. Although every measure had been taken for the escorting and safe passage of convoy group No. 1 to the submarine zone, and all necessary orders had been issued, with the full cognizance of the French and British Admiralties, a dispatch in the French, Russian, English war merchant code was intercepted between the *Seattle* and Brest. Not only was this dispatch sent in a code which was considered very unreliable, but it was either coded very poorly or garbled in transmission, and for these reasons, and the nature of the dispatch itself, further radio communication was undoubtedly necessary. The dispatch asked where French men-of-war would join the first group. This was entirely unnecsessary, as all arrangements that could be made concerning the question had been made in advance. Even in case the French torpedo boats failed to join before the group reached the coast, it was very inadvisable to attempt to communicate with the French Admiralty, particularly with an unsafe code. The convoy group was under wscort of six destroyers, which is more than is usually assigned troop convoys of such size.

On June 29, 1917, I received the following report from St. Nazaire, of the arrival of this first convoy group, and of a supposed attack upon it:

JUNE 29, 1917.

Group 1, Expeditionary Force * * * arrived on June 26, at midnight at St. Nazaire. Group 1 was met and escorted by United States destroyers and two small French war vessels. U. S. S. *Corsair* is with group 2. * * * Group 1 was attacked by a submarine at 10.30 p. m. on June 22, 85 miles from the first rendezvous and opened fire. Two torpedoes passed close to *Havannah*, two passed close to *DeKalb*, one across her bow and one under her stern as she turned away, one torpedo crossed the *Seattle* bows. There were no hits.

SAYLES.

(NOTE.—The foregoing is a paragraph of a quotation signed "Gleaves.")

On July 4, 1917, I received the following message from the Secretary:

Received: July 4, 1917.
To: Alusna, London.
This cable for Vice Admiral Sims.

The Navy Department wishes to express its satisfaction at the very effective way in which the escort of convoyed ships has been accomplished. Josephus Daniels. No. 20003.

DANIELS.

I wish to make it perfectly clear that I make no criticism whatever of the commander of the troop convoys. Such confusion and difficulties as arose were due to the orders and plans given to him by the Navy Department.

It might be interesting at this time to quote from an illuminating confidential intelligence report submitted by the naval attaché in Paris covering this period.

These are extracts from the report of the naval attaché in Paris.

To show how closely guarded military secrets were kept in the United States, I have only to state that the first knowledge I received that the first convoy had actually sailed, was in the course of a social conversation with a woman. Col., then Capt. B——, Gen.——'s personal and confidential aid, was present. As soon as we could draw aside to talk together, I never will forget the words he first said. The expression was a classic. Undoubtledly, the women's husband's business friends in New York had cabled him the news in some sort of a business code. I never pursued the subject further. But if one realizes that, at that time, the security in France against enemy agents was in the hands of M. Malvy, minister of the interior, since tried and banished for criminal neglect of duty, and that the then head of the secret police, and the chief assistant to the prefect of police, are both now serving jail sen-

Digitized by Google

tences for intercourse with the enemy, the necessity for more than ever guarding such a secret will be apparent. Due primarily to inexperience, and secondly, to the fact that three different general staffs were attempting to fix a rendezvous, a few days before the first convoy was due, there was still considerable confusion, in the French Ministry of Marine, as to just what was to happen, and where it was to happen, when our ships approach the coast.

The admiral in command of the troop convoy, had been told in Washington that he would be met by French destroyers, etc., and, as a matter of fact, they didn't exist. Like a great many other matters, it seemed impossible to make the Navy Department in Washington believe to what desperate straits the French naval forces had been reduced. They had only five destroyers on the west coast, and on the night of May 21, 1917, I had personally seen four of them put out of action, for weeks or months to come, in a destroyer fight off Dunkirk.

Now that it is all over, and we have won, and so many big historical events have happened since ; we are prone to forget the importance and what was at stake on a successful outcome of this expedition. If even one transport had been sunk, it might have resulted in disaster to the Allied cause.

It is not yet understood generally what Admiral Gleaves and his officers accomplished; it will be years before what it meant phsycologically to the allied cause will be fully appreciated.

To return to the general question of the unsound military nature of the plans for these first convoys, and to the danger and confusion which resulted, I exchanged numerous messages with the department in the next few days—that is, the first part of July, attempting to point out to them the principal errors which had been committed, with a view to preventing them in the future.

In referring to this subject, on July 7, 1917, in my letter report I said:

I feel reasonably certain that, if information reached the enemy as to the movements of the troop convoys, which it appears to have done, it was due to the method of communication in what is undoubtedly a wholly unreliable code. There is ample evidence here to support reports which I have made, to the effect that all codes of invairable character are dangerous, and that any code can not be considered safe unless it is frequently changed. It is for the above reasons that I have so urgently recommended the exclusive use of British Admiralty codes until such times as other secret codes based on war experience are available.

I mentioned the other day that in using those codes we had our own keys, which we changed frequently, so that they could not be read.

In other latter reports to the department, I pointed out how the inclination to trust their information and judgment alone had been the cause of very grave danger to our forces. As a matter of fact, it was only a matter of luck that we did not lose a number of vessels, not only from the troop convoys, but also from the various groups of destroyers which had arrived in May. In the case of the destroyers, they were saved only by the thoroughness of the precautions taken by the commander in chief at Queenstown to meet them. It was hard to believe otherwise than that the enemy knew all about the movements of these forces, from the day cables began to be sent about them.

In fact, the announcement of the sailing of the first destroyers was published in the Berlin papers four days before they arrived in Queenstown. The suspicion that the Germans were aware of our troops movements was therefore strengthened. As will be noted, I had recommended to the department, beginning early in May, 1917, that important and highly secret information should not be trusted to our own Navy codes, as I considered them unsafe. I had pointed out that the British codes had been tested and proved safe by war experience and were constantly being changed to prevent the enemy

Digitized by Google

from deciphering them. I had, therefore, implored the department in June not to send any messages concerning this troop convoy in any other than the British Admiralty's war codes, and yet all the messages I received still continued to be sent in the Navy secret code, and other codes which we had been using in peace times for years.

I am not going into the technicality of this business of codes. When I refer to changing the code, that refers to changing the cipher. As long as the ciphers are in keys which are changed, you can give the enemy the code book, and it does not do any harm, provided you change them frequently enough.

It was a revelation to me, and something quite outside of my previous experience, to see the extent to which the allies were breaking enemy secret codes. The problems of codes and their fallibility, if it could be fully stated, would make a story in itself and would furnish very interesting material for the committee, as well as the general public. It is sufficient to say that one of the many measures which enabled the Allies to have such complete information at all times of enemy submarine movement was their ability to break the codes and decipher the messages exchanged between submarines at sea and between them and their base.

I was too busy in those days to go into this question thoroughly; in fact, it was unnecessary; it was sufficient to me to know the above facts. There was nothing to do but to assume that the enemy was equally clever in breaking our codes. As a matter of fact, I later found that the enemy was not so clever, and that, fortunately for us, they apparently were not aware of the extent to which the Allies were able to break their codes. It seems that they did not change their codes nearly so often as the Allies did. They were, of course, using war codes while, on the other hand, our Navy Department was using codes which had been in use in times of peace for years past.

To sum up, I think I can safely say, therefore, that if the Germans had seriously desired to attack this first convoy, the action taken by the Navy Department and the method which it covered, provided the Germans with opportunity to obtain information as to the composition and route of the convoy. As I pointed out to the department in official and personal correspondence, the fact that the convoy arrived safely was due in a measure to good luck.

The fact that the department itself realized the impracticability and impossibility of carrying out further transport movements along the same lines that had governed the first groups is best shown by the fact that even before the convoy sailed the department had requested me to make recommendations as to how troop convoys should be handled in the future. I have already read the answer which I sent at that time. After the receipt of my reports concerning the confusion which attended the arrival of the first groups, the department again asked for recommendations in the following message:

Received July 9, 1917.

209. Following from Navy Department for Admiral Sims:

Future cross-water operations concerning save transportation of our troops to France is one of the most important operations of future. For this purpose every guarantee has been given to War Department that every effort will be made by the Navy Department to safeguard lives of the soldiers in crossing. From the interned German ships, 14 of the fastest, largest, and best will be commissioned, under complete naval control, and used to take over the troops. It is of the utmost importance these ships should receive greatest protection on the passage in, and owing to the valuable nature of

Digitized by Google

ships and difficulty of obtaining others in their place if lost, it is desirable to guard them on passage in Atlantic. Will you therefore submit an outline of what you consider the best method of carrying out such operations after you have consulted various authorities, especially the French? About 4,000 troops will be dispatched in each ship. Do you think that they should sail in company or singly?

I would not have believed it possible that that question could be asked at that stage of the game, how we should put the convoy in, and when we had put it in. [Continuing reading:]

During the voyage in, what protection can they expect from our destroyers and what from the French? Also, on the voyage out, what protection can and will be (given) by French, or do you contemplate providing that from our forces? In addition to sending you all the information in advance possible, should we request from you a rendezvous for each ship, or group of ships, leaving here and a course in from there, or will you in advance set out a course, both of which will be understood to hold good until you change the same? Should the Army supply ships, large number of which will be of moderate speeds, sail together in groups, or singly, so that greatest security may be given them in that part of voyage when it is the most essential? Even if these points have been discussed by you, it is desirable to have them clearly indicated, so that greatest efficiency and cooperation may be obtained from our combined efforts.

I do not think it would be possible for me to convey to you the discouragement of receiving at that date, after the miles of cables and letters I had sent in, there on the 9th of July exhibiting the crassest ignorance of the elements of the whole problem.

In view of the extensive communications which I had sent to the department concerning these convoys previous to this dispatch, I think it requires no explanation on my part to convince the committee of my feelings upon receiving such a message as this. Here was question after question asking about handling convoys which I had explained over and over again.

Some days before I had sent, by an armed guard officer, the full information which they requested. I therefore replied to the department as follows:

Sent: July 11, 1917.
To: Secretary of the Navy.

No. 95. Replying to your dispatch concerning troop convoys. I fully appreciate the importance of matters set forth therein. It is considered of vital importance to reduce cable communication on this subject to minimum. A comprehensive letter was forwarded via Lieut. Herbster on *St. Louis*, and another will be sent by next steamer.

SIMS.

As the plans contained in this letter were approved, and as they were adopted by the department in their entirety, without comment, and continued thereafter to govern the movements of our troop transport operations throughout the rest of the war, I would like to make a few brief comments before proceeding further. This secret report of July 6, 1917, is perhaps too technical to read to the committee. It is, however, a very important document and will be included in the record.

Those letters are long and very technical, and I think it would do no good at all to read them to you, but they should be submitted to the record so that they can be examined.

(The documents referred to are here printed in the record, as follows:)

[Letter No. 17.]

OFFICE VICE ADMIRAL COMMANDING
UNITED STATES DESTROYER FORCES, EUROPEAN WATERS,
London, July 6, 1917.

From: Vice Admiral William S. Sims.
To: Secretary of the Navy (Operations).
Subject: Procedure concerning protection of Army convoys in trans-Atlantic passage.

1. As it is apparent that the responsibility for the safe passage of troop convoys through the submarine area should be placed upon the commander of the escorting forces in that area, who has latest information as to enemy movements, I herewith submit my recommendations as to the procedure which I consider necessary for safety of future troop convoys.

2. These recommendations are based upon actual experience with the four convoy groups which have already made passage and after a thorough consideration of all British Admiralty war experience in connection with such convoys.

3. The greatest danger in connection with troop convoys lies in the possibility of interception by enemy of cable and wireless communications in connection therewith.

The below recommended procedure is therefore based primarily on this consideration—that is, insurance against any information reaching the enemy as to routes followed and prospective movements of convoys in time to be of any use to him.

I can not too strongly urge against all wireless communication between ships of convoy or between convoy and the shore except in cases of extreme necessity.

I must also lay great stress on the necessity of my having definite information as to the time when escorting forces will be necessary.

The destroyers available for escort duty, as has been reported to the department, are also absolutely essential to the safety of vital merchant convoys. And in addition they must be prepared at all times to take advantage of any opportunity for effective offensive operations against the enemy.

It is therefore absolutely necessary that I be enabled to plan in advance and to coordinate all work of the destroyers in the submarine zone.

4. The following specific procedure, stated in the order of its occurrence, is therefore recommended:

First. Notify me in British Admiralty codes as far in advance as possible of (*a*) probable date of sailing of convoy group, (*b*) the number of ships, and (*c*) anticipated average sea speed.

This communication should contain no information as to routes to be followed or rendezvous to be made.

Second. Issue sailing orders to the convoy group in the manner prescribed below, and concerning which the greatest possible secrecy should be maintained, not even allowing the essential parts of the orders to be known generally to officers or clerical staff of the department, or, in fact, by the convoy group commander himself until after he has sailed.

Select a meridian which will be known hereafter as the standard meridian. I recommend the thirtieth, and will assume in the absence of contrary instructions that the department hereafter in referring to standard meridian will refer to the thirtieth.

Select in the Navy Department a latitude in which the convoy group in question should cross the standard meridian. In cabling this latitude add 3° to it for purposes of deception. In absence of contrary instructions, I will understand that a constant figure of 3° will always be added to the actual latitude in which the convoy will cross the standard meridian.

Also decide upon a definite time at which the convoy group in question should cross the standard meridian in the latitude selected.

In selecting this time due leeway should be allowed for heavy weather and other casualties which may reduce the convoy below its anticipated sea speed. For example, if the convoy should encounter good weather and find itself in advance of scheduled time, it should deliberately slow down sufficiently to insure its passage through the point selected at the time previously arranged. This affords us on this side definite information as to where the convoy will be at a certain specified time, and this without the necessity of any further communication with the force itself from either side. Such increase in the time required to make the passage as results from this procedure is of no consequence in comparison to insuring the safety of the convoy.

After the convoy is joined by the escorting destroyers it will, of course, proceed at maximum speed.

Third. On the days of departure of the convoy group cable me in British Admiralty code a message such as follows:

Digitized by Google

"Convoy group No. 1 latitude 49 N. 10 a. m., August 21."

I will understand this message to mean that convoy group No. 1 (as previously reported) sailed on the date of this dispatch, and that it will cross the standard meridian (the thirtieth) in latitude 46 (49 minus 3) at 10 a. m., July 21.

On this information I will be enabled to prepare in adequate time definite sailing orders for the escorting destroyers and issue the necessary instructions to insure their readiness for the duty in question.

In the case here used for illustration I would understand that the convoy group passing through latitude 46 N., longitude 30 W., on August 21, would proceed on a course at its average sea speed direct for its destination.

The escorting destroyers will receive orders to intercept the convoy group on this line, and well to the westward of the dangerous submarine zone. And they will also have orders as to any necessary diversion from the direct route on the way to their destination. They will also be kept informed of the latest news at all times direct from Queenstown as to enemy movements.

Fourth. The destroyers, after joining with the convoy group, will inform me in a special secret code of the approximate time and latitude in which they will cross a certain meridian—usually the tenth.

This information will reach me through Queenstown station, and will enable me to notify the French ministry of marine in order that any necessary mine sweeping may be done, and that French torpedo boats may be on hand off the port to give any necessary instructions as to the method of approaching the port.

5. To sum up, two dispatches only would be sent to me from the department. I would send nothing in return except acknowledgments.

The first of the two dispatches should be sent as far in advance of sailing as it is possible to anticipate approximately the time. This dispatch is particularly important, because if I should find that the prospective arrival in the submarine zone of troop convoy should coincide with the arrival of a merchant convoy it might be necessary to request a delay of one or the other.

The second dispatch, which states only latitude, date, and time of crossing the standard meridian, gives no information of essential value to the enemy, because the standard meridian is not mentioned in any dispatch

6. I would strongly recommend that no other cable or wireless communications be sent except in case of extreme necessity; and further that the convoy itself be directed to carefully avoid wireless communication except such as may be necessary at very low power for communication with destroyers when they reach a relatively close position.

7. The convoy commander should be directed to accept the advice of the senior destroyer commander as to courses and speed and formation after escorting destroyers have joined. They will have the latest information as regards enemy movements, and it will also be possible, if necessity arises, to communicate with them from their headquarters at Queenstown, where the latest developments are always known.

8. I would strongly recommend that no communication be made with the French shore. It is very unwise, as long as sufficient escorting destroyers are sent from Queenstown, for French men-of-war to attempt to meet and escort our convoys in, except when they arrive near their destination, to give them information about channels, etc. Such a course necessitates radio communication in a code which is now well known to be compromised. There is also great danger of misunderstanding on account of differences of language.

I have thanked the French ministry of marine for the courtesy extended and protection afforded by the French vessels which were sent to meet our first four troop convoys. They were sent primarily as a courtesy in view of the historical significance of the occasion. I am in constant touch with the French ministry of marine and there will be no misunderstandings. I think it very undesirable to send communications concerning the movements of the convoys to the French ministry of marine as well as to me. I will keep them fully informed to such extent as may be necessary in arranging for arrival of the convoys.

9. One of the first essentials in the movements of shipping in the war zone is that it should never stop or even slow down, but should proceed to destination at maximum speed, regardless of circumstances. If, for example, in heavy weather, the escorting destroyers should not be able to join, the convoy should disperse and proceed independently at maximum speed, and zigzagging. This is the practice of the British service. There is little danger of submarine attack in such heavy weather.

Likewise, in case of fog or other unusual conditions, if the convoy should become separated, it is much the wiser course for each ship to proceed independently rather than to attempt to reassemble by changing course, slowing down, and sending numerous wireless communications.

Digitized by Google

10. All internally codes and merchant codes are unreliable. There is good reason to believe that they are in the hands of the enemy. It is therefore entirely essential to safety that radio communications, when necessary, be confined to the latest United States or British naval codes with ciphers. Our destroyers are equipped at all times with such codes. Any necessary communications while en route which can not be foreseen should be made preferably by destroyers, which have the code, to "Vice Admiral, Queenstown," who will take the necessary steps and keep me fully informed in case of my absence from Queenstown.

11. Briefly stated, when the convoys have reached the submarine zone they should act under the guidance of the escorting destroyers, subject to orders of the commander in chief at Queenstown (the command under which they are operating at all times). I am kept fully informed at all times as to all duty being performed by our destroyers there. and accept full responsibility for all orders which emanate from Queenstown to or via our destroyers. They are thoroughly familiar with the policies and methods of communication in use in Queenstown area, and it is highly desirable that they should continue under the same policies and methods as those with which they are constantly working in the war zone.

12. I would cite an incident illustrating the great danger of attempting to communicate to more than one headquarters. Although every measure had been taken for the escorting and safe passage of convoy group No. 1 through the submarine zone, and all necessary orders had been issued wth the full cognizance of French and British admiralties, a dispatch in the "French, Russian, English" code was intercepted between the *Seattle* and Brest.

Not only was this dispatch sent in a code which is considered very unreliable, but it was also either coded very poorly or garbled in transmission, and for this reasons, and also the nature of the dispatch itself, further radio communication was undoubtedly necessary. The dispatch asked where French men of war would join the first group. This was entirely unnecessary, as all arrangements that could be made concerning the question had been made in advance. Even in case the French torpedo boat failed to join before the group reached the coast, it was very inadvisable to attempt to communicate with the French Admiralty, particularly with an unsafe code. The convoy group was under escort of six destroyers, which is more than is usually assigned to troops convoys of such a size.

13. I trust that the Department will see fit to adopt the recommendations contained in this letter, which will involve placing full responsibility on me for handling the convoys while in dangerous waters. I am convinced that the principal danger to be considered is preventing the enemy from intercepting cable dispatches as to the movements of convoys on the high seas. Hence the necessity for a minimum amount of communication and the undesirability of selecting a series of rendezvous and having to constantly refer to them in dispatdhes between the department and myself and between me and France and between the various stations involved in England.

It will be observed that the method suggested is "iron clad" in this respect, namely, that even if all the messages indicated were intercepted and translated by the enemy there is no information in them which would enable them to intercept a convoy on any parts of its route, since the standard meridian is not mentioned and three is added to the latitude.

It is true that the method involves the inconvenience of having the convoy reach the standard meridian at a prescribed time; but we can always be sure that it will not cross this line ahead of time, and if it is somewhat late this means only that the destroyers will have to wait for it. But even this inconvenience can be avoided, except in very exceptional circumstances, by allowing a sufficient margin between the maximum sea speed and that necessary to reach the standard meridian at the prescribed time.

As has previously been reported, a convoy of eight transports with an escort of eight destroyers is safer than two convoys of four transports, each escorted by four destroyers. See my letter of June 13, 1917.

Convoys should not follow each other at intervals of less than one week, because if a number arrive in quick succession they will require the absence of a great many destroyers from their patrol area at the same time.

As the escorting cruiser affords no protection again t the attack of submarines, she should return to the United States as soon as the destroyers join the convoy, provided she has radius enough to do so. In the case of British convoys, the cruiser leaves the convoy as soon as the destroyers join it, and proceeds to port (for coal, etc.) at full speed.

The British consider it essential that the convoy commander should always be on one of the escorted vessels (transport or merchant vessel). This because both the cruiser and the convoy should be free at all times to maneuver separately, the former to maneuver for attack and chase of a raider and the latter to maneuver to avoid the enemy.

Digitized by Google

In accordance with the plans proposed therein, all that part of our expeditionary Army overseas, which was transported on American ships, was safely carried eastward through the war zone, without any loss whatever from any enemy action.

It is, of course, true that we had some losses of troops carried in allied transports, which were handled in accordance with this plan, but, in justice to the Allies, it should be pointed out that these transports landed in British ports, and were therefore necessarily carried through the same areas as the majority of merchant shipping. It was in this area, as I have repeatedly pointed out, in which the enemy very wisely, and of necessity, concentrated his principal submarine efforts.

In view of certain slurring remarks made before this committee, in its previous inquiry, concerning the officers of my staff, I wish to emphasize the importance of these plans, and also the tremendous strain under which they labored, assisted by but one regular aide at this time, in preparing them, not to mention all of the other demands made upon us.

I wish clearly to establish the fact that the responsibility, throughout the war, for the safety of our troops in the war zone, rested primarily upon me. If there is any question as to this, the various documents which I am submitting should clear it up. One thing is certain, and that is that there can be no question as to whose head would have come off if the plans had not worked out satisfactorily, or even if our troopships had not been joined at the proper times by their destroyer escorts in the war zone. I would like to quote two paragraphs only from this letter of July 6, 1917, which embodied the plans in question:

As it is apparent that the responsibility for the safe passage of troop convoys through the submarine area should be placed upon the commander of escorting forces in that area, who has the latest information as to enemy movements, I herewith submit my recommendations as to the procedure which I consider necessary for the safety of future troop convoys. These recommendations are based upon actual experience with the four convoy groups which have already made passage, and after a thorough consideration of all British Admiralty war experience in connection with such convoys.

* * * I trust that the department will see fit to adopt the recommendations contained in this letter, which will involve placing full responsibility on me for handling all convoys while in dangerous waters.

Upon the receipt of this letter in the department in Washington I received the following message:

[Cablegram received July 22, 1917.]

Origin: Washington.
To: Admiral Sims. Secret 56.

Your letter No. 17. Rules for convoy therein accepted and will govern.

The subject of the assistance which was afforded me during this period will be taken up later; but the committee can perhaps realize the task which confronted me at this time, in handling all the other subjects which you have heard about in previous testimony, and at the same time digging out and digesting previous allied experience with troop convoys, in order to prepare this plan. From this experience, upon which we based the plan, we found out just as much about how not to do it as about how to do it. We went over the detailed history of convoy after convoy, and studied all the difficulties which arose, both before the convoy sailed and while it was on

Digitized by Google

the high seas. Throughout the war the routes followed by all troop convoys, and, in fact, also by all United States Government vessels, naval or merchant, were furnished from my headquarters in London, where also all detailed plans were prepared and issued to insure the destroyers meeting up with the convoys on the high seas to escort them through the dangerous areas.

In dealing with the establishment of the convoy system I referred to the adoption, at the end of July and in August, 1917, by the department, of the recommendations which I made at this time for the handling of Army and Navy supply ships. It will, therefore, be unnecessary for me to read again my cables of July 12, 14, 28, 31, and August 4, 1917, which I have already either read, or referred to, in my discussion of the convoy system, and in all of which I urged that all shipping should be coordinated in such a way that ample protection could be given, not only to troops but to Army and Navy supply ships, and to mercantile shipping as well. The department agreed to this policy, and it was followed throughout the war, with the result that we were able, from London, to assign routes to all convoys and to provide the necessary escort for the danger zone. The proof of the effectiveness of the plans recommended is to be found in the success which attended the convoy system thus established, and by which our troops and Army supplies were transported with comparative immunity from submarine attack.

In spite of all these communications and the department's acceptance thereof, it developed that our troubles in handling troops were not yet over. It was about this time, that is, during July, as nearly as I can remember, that the authorities at home started in the practice of sending troops overseas in allied passenger liners and other ships. In many cases the allies were not consulted at all, and apparently all that was done was to go to the office of the shipping lines and buy passenger space, filling it up with troops. I distinctly remember the embarrassment which was caused to the allies by suddenly discovering, after the ships were on the high seas, that they were in fact troop ships. I remember that the question arose as to what constituted a troop ship and what did not. As repeatedly stated before, we were woefully short of escorting and protecting craft.

Something had to suffer. It was a heartrending task to try to decide where we were justified in drawing the line. Various schemes were drawn up in the attempt to divide shipping according to its importance to the outcome of the war. In all such classifications, troops, of course, always came first, and then followed such designations as "specially valuable," "valuable," and so forth. It was even necessary to leave passenger vessels with wholly inadequate or, in some cases, no escort at all. And then the question would arise as to whether such a liner was a troop ship, whether she had only 10 soldiers aboard or 50.

Further to complicate matters, the method of communication continued to be very badly confused. All experience during the war showed that no precaution could be too great to restrict the number of people who were entrusted with essential information upon which the safety of ships at sea might depend. I learned during these days that information concerning troop sailings continued to be rather widely dispersed among various allied officers.

Digitized by Google

I did everything I could to get all communication concerning troop movements on the high seas narrowed down to one line. For example, I sent the following cable on July 24:

To: Secnav.

One hundred and twenty-nine. In order to insure safety of troop convoys, I consider it essential that no cables concerning movements, times of arrival, etc., be sent by Army or others, but all information should be sent through Navy Department to me, and I will notify all concerned, including French ministry of marine. 18023.

SIMS.

It should not be forgotten, however, that the substance of this recommendation had been made many times before.

On July 25 the department cabled me that they had accepted this suggestion.

On July 28, 1917, I cabled the department again, concerning the many sources from which information concerning these sailings was reaching Europe. My cable was as follows:

JULY 28, 1917.

To. Secretary of Navy.

One hundred and forty-five. Information concerning proposed and actual movements of troops and troop supplies reaches France in various direct and indirect ways. For example, from War Department to its various representatives abroad and from French military and naval attachés, and from the various French missions in America. Information concerning troop movements has even been heard in social circles. The greatest danger of such information reaching the enemy lies in methods of communication and codes used, in multiplicity of official, or other communications exchanged. All experience of war, in handling valuable Government shipping, and all war secret service experience, points to necessity for restricting communications to a minimum, and reducing personnel who are to be trusted with vital information involved. I therefore submit that the most important measure that can be taken to insure maximum degree of safety for troop and troop supply shipping, and in fact to provide against disaster, is to require that all information concerning movements of such shipping, proposed or actual, should be transmitted safely through the Navy Department to me, holding me responsible for informing all parties concerned on this side, in sufficient time. French ministry marine and Gen. Pershing are in full accord with these recommendations. The French Government is taking steps to stop future communications by their representatives in America. But it is necessary to also take effective steps to insure that no information concerning the above is sent out of Washington, by officials of any government, or our own, except through Navy Department, which alone can be responsible for safety at sea.

SIMS.

This message was accompanied by another message of the same date, sent by Gen. Lassiter, the War Department's representative in Great Britain, to the War Department, indorsing my recommendations, and urging that all such information should be sent only through me. This message I will not read, but will merely submit for the record:

The message referred to is as follows:

[Cablegram sent July 28, 1917.]

To: Secretary of the Navy.
Serial No. 155.
No. 155.
For: War Department.

"With regard to the movement of United States troops to France via England, it is necessary to know two weeks before the arrival of the troops in England—

"First. The exact composition of the party, i. e., the number of officers, enlisted men, nurses, civilians.

"Second. The amount and character of baggage with party.

"Third. The purpose for which the party is coming, i. e., to serve with the American, British, or French forces.

Digitized by Google

"The foregoing information should be furnished with regard to all parties coming, no matter how large or how small their size. Thus, if staff officers are coming on a certain ship, information to that effect should be given. Moreover, if any parties of a quasi military nature, such as Red Cross or other organizations having a distinctive uniform, are sent over, notification should be given. On receipt of this information in London through Admiral Sims it will be transmitted at once to the war office and to Gen. Pershing's headquarters in France. Lassiter."

SIMS.

In another message, of July 28, 1917 (my No. 150), I again called the attention of the department to the importance of keeping secret everything in my letter No. 17, concerning the plans for handling our troops on the high seas. This message was as follows:

JULY 28, 1917.

To: Secnav, Washington.

No. 150. Reference your 56, and my letter regarding troop convoys. Please note my urgent recommendations that procedure contained in my letter be restricted only to Government troops and troop-supply ships bound for France, and not individual commercial ships carrying small units and bound for England or other countries. Such latter vessels should be routed by British shipping officers, the same as for all British vessels proceeding independently. The system I recommended should not be communicated to shipping officers at various ports, but should be confined solely to one or two officers in department. A message was received by Admiralty concerning *Philadelphia*, which apparently referred to system recommended for troop convoys, and which was therefore not understood. If cables are to be exchanged with any source but me concerning the system, its primary object of secrecy will be destroyed.

SIMS.

I received the following reply from the department:

Origin via Simsadus, London.

Your 150. Your letter No. 17, regarding troop convoys, known only to two officers. The instructions contained therein have been used only for convoys bound for France, and will be used only as you request in your 150. Commercial ships bound for England are not routed this way. We have not misunderstood your wishes in this matter. We have no knowledge of the Admiralty message about naval vessel *Philadelphia*, and since the receipt of code O we are communicating directly with you. 18001.

BENSON.

On August 2, 1917, I was informed by the department that arrangements had been made for handling all communications with regard to the movement of troops and Army supplies in the manner that I had recommended, and later on I received a copy of a memorandum which was sent by the Chief of Staff at this time to The Adjutant General to put these recommendations into effect. It would not contribute anything of interest to read this memorandum, and I will therefore merely ask that it be inserted in the record.

(The memorandum submitted is here printed, as follows:)

47. As a result of the recommendations of Admiral Sims the War and Navy Departments agreed that all information concerning movements of troops should be sent only via the force commander in London. The following memorandum covering this point was signed by the Chief of Staff of the Army on August 2:

AUGUST 2, 1917.

[Confidential.]

MEMORANDUM FOR THE ADJUTANT GENERAL.

The instructions heretofore given under which the military attachés in Washington of certain allied Governments have been furnished with advance information of sailings of individuals and organizations for service abroad are revoked. The instructions under which The Adjutant General of the Army has been sending notice of sailings of cargo vessels and of Army personnel to Gen. Pershing are hereby revoked. Information of such sailings, actual or prospective, will be sent to The Adjutant General hereafter by confidential messenger from the ports of embarkation. When received, they will be furnished by confidential messenger—a commissioned officer

Digitized by Google

of The Adjutant General's Office—to an authorized officer of the Bureau of Operations of the Navy. It is then the exclusive business of the Navy to convey the information to the senior naval commander abroad, who is charged with the further duty of informing Gen. Pershing and our attaché in London of such sailings.

The chief of the embarkation service will govern the communications of his office with the Navy by the same rule of confidential messenger service. The effect of these rulings is to prohibit all bureaus and agencies of the War Department sending information relative to the sailing of our personnel or our cargo ships for Europe and to confine the transmission of such information to one channel only, namely, the Navy. This prohibition extends to the giving out of such information to anyone in this country which either in the course of duty or by accident may come to the knowledge of any officer.

TASKER H. BLISS,
Major General, Acting Chief of Staff.

On August 10, 1917, I received a message from the department announcing that the methods I had proposed in my letter No. 31 had been accepted and would begin with group 7. This letter was merely a further elucidation and confirmation of the original important letter proposing the plans for handling our troops at sea.

The department's message was as follows:

SIMSADUS, *London:*

Opnav, 124. Reply your letter 31. Troop convoy system satisfactory. Begins with group 7. Acknowledge. 2009.

ADMIRAL BENSON.

All the recommendations that I had made in regard to restricting communications to one channel, had been fully discussed at Paris, during the naval conference there at the end of July, 1917, and the recommendations were made only after a full discussion with Gen. Pershing, and with the chief of staff of the French Navy. They agreed with me absolutely, and the British authorities were also in complete accord.

Gen. Pershing assured me that he would cable the War Department that all communications concerning troop movements should pass only through the Navy, and the French and British chiefs of staff also assured me that they would instruct their officials in America to discontinue sending any information about troop movements. I might add that one cause of great concern about this matter of communications was the fact that I was horrified to find during my visit to Paris, that information about these convoys coming over was known in official and social circles, even before Gen. Pershing knew about it himself. It appears that the various allied naval attachés and missions in America had been picking up all kinds of information, here and there, telegraphing it to their Governments. The same thing had been true of the War Department. After my recommendations were put into effect, the leakage of information ceased, and it became possible to handle the great volume of Army shipping with comparative secrecy.

While discussing this question of the protection of American troops while they were being transported across the eastern Atlantic, it should perhaps be emphasized again that I fully realized that the full responsibility for their safety rested upon me, and upon me alone. I realized, too, from the first, that this, of course, was the primary mission which the American naval forces in Europe had to fulfill. However, during the period in which our troops were crossing in very limited numbers, and especially in the first months of the war, when practically no troops were being sent over, I regarded it as

Digitized by Google

imperative that our antisubmarine craft should be used to the maximum advantage in defeating the campaign of the submarine against merchant shipping, and thereby saving the tonnage so vitally needed by the allied cause as a whole as well as for the support of our Army. I remember Gen. Pershing telling me at this time, that is, at the end of July, 1917, that an army of a million men on the western front would require 50,000 tons of freight a day. In other words, this would require a total of five 10,000-ton cargo ships arriving each day, or 150 every month. It would have required a total of nearly 5,000,000 tons of shipping to have kept this army constantly supplied with all necessary equipment, food, munitions, artillery, etc.; and it was very clear from the first, as I have already pointed out, that unless shipping could be saved at this time, it would probably be impossible for America ever to support an army in France. I was, therefore, completely in accord with the Secretary of the Navy in his attitude set forth in the following cablegram, which I received on July 28, 1917:

JULY 28, 1917.

Origin: Josephus Daniels.

Vice Admiral SIMS, *London*.

Opnav 35. The paramount duty of the destroyers in European waters is principally the proper protection of transports with American troops. Be certain to detail an adequate convoy of destroyers, and in making the detail bear always in mind that everything is secondary to having a sufficient number to insure protection to American troops. 11027.

JOSEPHUS DANIELS,
Secretary of the Navy.

I realized that, in order properly to protect American troops abroad, it would be necessary to protect and to save enough of the Allied shipping to keep this army in France. The Navy Department must also have realized this but did not appear to give it due weight.

Volumes would be required for all the messages that were sent back and forth, between my headquarters and the Navy Department, concerning the whole question of the transport of troops abroad, but it would not be particularly profitable to go any further into the matter. I think that enough evidence has been introduced to show that the department, in attempting to direct the whole voyage of the first troop convoy from America, committed a very dangerous fundamental military error, as they could not possibly possess the information in Washington upon which the orders for the protection of this convoy in the war zone should be based. I have also shown that the department themselves recognized this error, by calling upon me for recommendations, based upon an examination of the war experience of the Allies; that when these recommendations were submitted to the department, they were adopted, and subsequently governed the whole of our Atlantic transport of troops and supplies; that the responsibility for the safety of these troops and supplies devolved upon me, in so far as their passage through the war zone was concerned; that their routing was done from my headquarters; and that their escorts were arranged by the forces under my command. The best proof of the effectiveness of this protection is the fact that no troop transport bound for France with American troops was ever sunk by a German submarine.

As an illustration of how close and cordial were the relations between my staff and that of Gen. Pershing, and of how completely

Digitized by Google

we were in agreement, it may be interesting to refer to a cable which I sent Gen. Pershing on January 4, 1918, in reply to a request from him with regard to the routing and handling of army transports. My message of January 4, 1918, was as follows:

[Cablegram sent Jan. 4, 1918.]

To: Gen. Pershing.
Urgent. For Gen. Pershing.

All the forces under my command are disposed with the primary purpose of assisting in the safe and prompt dispatch of troops and supplies to France, and safe convoy out of France.

Regardless of original destinations, I shall at any time, at your request, divert cargo vessels, fuel ships, animal transports, or mechanical transports, to any port you desire. This diversion can be made at your convenience, at any time while the vessels are en route, or after arrival on this side. Our plans provide for diverting vessels from one port to another, at any time, to facilitate your operations.

You will appreciate that, with troop transports, the utmost safety must be assured, combined with secrecy of movements. There are many considerations that can not be placed before you in a cable. For this reason I directed Commander Kurtz, on January 2, to proceed from London to your Paris headquarters, to present certain considerations. If the result of this conference was unsatisfactory, I request you will do me the honor of sending an officer to London to present your further wishes in this matter.

I fully appreciate the urgency of the situation, my dear General, and will leave nothing undone to assist your operations in every way. 12004.

SIMS.

It will be noted that there never was any question about my recognition that the primary mission of the forces under my command was the protection of American troops and supplies.

It would be possible to take up many other subjects and show how, in other cases, the department similarly insisted upon acting from Washington, upon the incomplete information which they had available there, and how thereby mistakes were made, and impracticable plans proposed. I have already shown you how, in the case of convoys, for example, because of a wrong estimate of the situation, the department delayed putting into effect the convoy system, and strove, as an alternative measure, to carry through schemes, such as the arming of merchantmen, which were of value, certainly, but of minor importance, or such as the establishment of a completely new system of handling merchant shipping, which because of the critical situation, was thoroughly impracticable.

I wish now to discuss only three or four other similar cases, such, for example, as the plan which the department insisted upon for meeting a possible raid against convoys, by enemy battle cruisers in the Atlantic, and, finally, the plans proposed by the department with the object of finding a royal road to victory, by blockading the German ports, or similar measures.

The question of a possible use by the Germans of raiders to attack convoys, and perhaps even of the employment of battle cruisers for this purpose, had, of course, been under consideration by the naval staffs of the Allies, prctically from the time at which the use of the convoy system was begun. It had been fully recognized, of course, that a heavily armed, fast ship could probably destroy a whole convoy with extreme ease, if such a raider ever got loose in the Atlantic on the convoy routes. I pointed this out repeatedly to the department in the summer of 1917, as, for example, in my official letter-report No. 864, of September 15, 1917. At that time I pointed out that it was important to have plans prepared, and kept constantly up to date, at all times, in the event of such raider activity. I stated

Digitized by Google

that it would, of course, be possible to abandon the convoy system entirely and revert to a plan of dispersed shipping, but that this course did not seem a sound one, and that greater protection could always be afforded by keeping the shipping in convoys, and by providing these convoys with escorts of sufficient gunpower to overcome any raider. I insert an extract from this letter in the record. It is as follows:

[Letter 864.]

SEPTEMBER 15, 1917.

One possible enemy move would be to use the relatively smaller number of long-distance submarines as scouts, relatively close to the American shores for the sole purpose of locating and tracking convoys passing the information along to raiders or other submarines held in reserve nearer to the European coast.

It would seem important to have plans prepared and kept constantly up to date at all times with a view, if the necessity should arise of initiating an extensive scouting campaign or else of actually individual escort of troop and other important convoys.

It is, of course, possible at any time if a serious menace should be encountered from raiders, to entirely abandon the convoy system and revert to a plan of dispersed shipping. It is strongly believed, however, that such a course would not be a sound one, and that greater protection will always be afforded by holding the shipping in convoys escorted by cruisers of sufficient power.

Any individual convoy could, if the occasion demanded, be dispersed at any time. It is understood that all ships of convoys are given orders as to routes to follow in case of forced dispersal.

A reversion to a system of independent sailing such as existed before the convoy system was put in operation would again return us to a situation in which the available number of antisubmarine craft operating as patrol craft would be wholly inadequate. Escort of individual vessels would be entirely out of the question.

I understand that negotiations are now under way with the Japanese Government with a view to basing their battle cruisers and perhaps some of their light cruisers on a British port as a measure of preparedness against high-sea raiding during the coming winter.

In my letter report of October 23, 1917, I referred again to the question of possible activity of enemy raiders, again emphasizing that the subject was one which required the most thorough and complete estimate of the situation, which could not be made with the staff I had at that time. As I will point out in a moment, I had still been unable to obtain from the department a sufficient staff to permit a continuous study of the war situation, and the formulation of plans, such as would be required to meet such a situation as this presented by the possibility of the operations of enemy raiders against convoys. In this letter of October 23, I discussed the cruises of the previous raiders which had escaped, and the possibility of a repetition of such operations, pointing out again that the only apparent effective solution was the assignment to each convoy of a force superior to that which could be expected of the raiders.

I insert in the record an extract from this letter. [Reading:]

[Letter Oct. 23, 1917.]

14. The situation concerning enemy raiders, particularly during the coming winter months, is one fraught with grave possibilities. The subject is one which requires a most thorough and complete estimate of the situation, which can not be done with available staff here. Some of the general considerations involved in this subject may be stated as follows:

(*a*) The disposition of British and allied fleets to prevent escape of raiders.

(*b*) The neutrality of Norway. The question of whether raiders have used, and will in future use, the neutral waters of Norway for escape.

(*c*) The extension of the convoy system and provision for escorting all convoys with vessel of sufficient power to withstand the attack of raiders carrying at least 6-inch guns.

(*d*) The placing of shipping in remote areas such as the Indian Ocean, South Atlantic and Pacific in convoys, whether escorted or not, in order that they may be easily

Digitized by Google

diverted the moment any news of a raider is obtained. As long as shipping is not in convoy, it is a most difficult, if not impossible, problem to attempt to divert it or control its routing, particularly shipping which is under way on the sea.

(*e*) The broad question of whether the enemy may consider it as warranted to jeopardise the chances of success in possible future fleet actions in favor of risking his entire light cruiser force, and possible battle cruisers, in addition to converted merchant raiders, in serious attempts at high-sea raiding.

Action against enemy raiders is to be considered from two points of view: first, operations to intercept them before they reach the open sea; second, arrangements to protect shipping if the first can not be made effective.

As long as Norway remains neutral, we must certainly expect that her neutral waters will be utilized by raiders, particularly on the long dark nights of winter, and if this is permitted it is practically impossible in view of the large sea areas to the northward, even around the north of Iceland, to prevent the escape of raiders.

In addition to the recent very successful attack by the new very fast enemy light cruisers on a Norwegian convoy in the North Sea (as reported by cable) we have examples of what a few raiders even of the converted merchant type, may accomplish. Evidence indicates that the *Mowe* probably left Germany during the first half of November, 1916, and, after sinking 112,000 tons of British shipping alone, containing many valuable cargoes, she succeeded in returning to Germany in safety.

The *Wold* apparently left Germany during the first half of March, 1817, with a cargo of mines with which she succeeded in accounting for at least 90,000 tons of British shipping alone in the Indian and Pacific Oceans.

The danger from mines in the track of shipping well outside of what might be called the war areas, is illustrated by the sinking of the *Cumberland* off the coast of Australia in over 75 fathoms of water. Also the sinking of two large ships in the vicinity of the Cape of Good Hope over six months after the first merchant ship had struck a mine in the same vicinity.

As no evidence of the *Wolf* has been obtained since about the 1st of March, she has either returned to a home port or come to grief elsewhere.

The *Seeadler* left Gemany in the middle of December, 1916, and accounted for at least 10,000 tons of shipping in the South Atlantic before she was finally run ashore on one of the South Sea Islands within the last few months.

The tonnage figures mentioned for the above vessels are minimum figures which are definitely known concerning British vessels. In addition, the ships in question undoubtedly accounted for considerable allied and neutral tonnage, and there are also other ships still long overdue which may have been sunk.

The fact that the amount of tonnage sunk by enemy submarines has not increased in spite of an increase in the number of submarines operating, and the fact of America coming into the war with the effort that she is putting forward in the way of shipping alone to ultimately defeat the submarine campaign, would seem to be in itself a sufficient reason to expect very determined efforts by the enemy to add to the work of submarines the efforts of high-sea raiders.

From the general survey of the situation it is considered very impracticable that the escape of raiders during winter months can be prevented. During these months there is over 20 hours of darkness in northern waters which would be used for escape.

The only apparent effective solution would seem to be the consignment with each convoy of a force superior to that which may be expected on raiders.

I was so seriously impressed with this possibility that, even with the insufficient staff that I had, I made a special study of this situation, in 1917, and submitted on November 2, 1917, a letter with regard to the protection of troop convoys, in which I specifically discussed the possibility of enemy raiders operating against them. This letter is too long to read, but as it covers the whole situation, it will perhaps be interesting to insert it in the record:

TROOP TRANSPORT SPECIAL LETTERS.

NOVEMBER 3, 1917.

From: Force commander.
To: Secretary of the Navy (Operations).
Subject: Protection for troop convoys.

1. The three things that endanger our troops transports are:
(*a*) Submarines and mines encountered in the zone.
(*b*) Raiders on the high seas.
(*c*) Large submarines operating outside the zone.

Digitized by Google

2. Of these dangers there can be no question that the maximum danger is occasioned by (*a*). With the approaching winter nights I think the next greatest danger to which they will be exposed is (*b*), particularly if ships are sent without ocean cruiser escort. There will always be zone danger from (*c*).

3. We are thoroughly familiar with the danger from submarines and mines in the zone, and know what steps to take to protect our transports, although it must always be understood that, regardless of the protection given, a chance shot from a submarine (a Browning shot from a long distance) may sink a vessel, a drifting mine torn up by the winter gales may sink a transport, or mines not encountered by the sweepers may damage or sink one of our ships.

4. So far as raiders are concerned, a battle cruiser on the high seas would easily overpower our areared cruisers, and again our protection is only partial.

5. There remains to be discussed the new problem of large submarines operating outside the usual area of the ordinary submarine. Thus far there has been one (or possibly two or three) of these vessels operating outside the regular submarine area. In every case the operations of this vessel or vessels have been to the southward of the seas, and at the present moment one is operating along the West African coast.

6. Nearly all the sinkings occasioned by these submarines have been by gunfire. A large submarine is unwieldy and difficult to maneuver under water, and never will be as efficient for torpedo work as the smaller type. Like other vessels of small freeboard, they must confine their operations to areas where good weather prevails. It is not, of course, impossible for a submarine of large type to cross the North Atlantic or a operate in that area; but considering the approaching winter gales, the whole proprocedure is most unlikely. There is always the question of strain on personnel and damages to the submarines that are to remain at sea for several weeks. I consider it highly improbable that the efforts of these submarines will be confined to areas where good weather prevails.

7. During this winter they could operate in such areas as the islands off Africa, off Gibraltar, and so forth. I consider, therefore, that there is little chance of encountering large submarines in the North Atlantic during the winter, but that there is more liklihood of encountering raiders.

8. Modern German light cruisers making upward of 20 knots, and a 17-knot ship like the *America*, or even the 24-knot *Kaiser Wilhelm*, would fall an easy prey to a 30-knot light cruiser. It is for this reason that I do not recommend routing our large transports independently. It is true that the *Olympic* was routed independently for some time, but that was during a period when only small, slow raiders were sent out by the enemy. Since the convoy system has been established, resulting in a partial defeat of the submarines, it is not at all unlikely that the enemy may meet this situation by dispatching a greater number of raiders of greater speed and power. This is a matter that has always to be considered.

9. As is well known, it will be difficult, if not impossible, for our destroyers to stand the North Atlantic weather during the winter. There is no doubt that the destroyers can weather gales, but they can make little progress into them. Furthermore these gales may do considerable damage to the vessels and result in laying them up. I consider it will be difficult to carry out a plan of giving to our transports destroyer escort across the North Atlantic during the winter. In fact, there may be times when out troops can not be met by destroyers, on this side, and may have to travel a considerable part of the distance through the zone with destroyer escort. The British have had this experience several times in handling troop transports. Within the last week two mercantile convoys were broken up by storms to the westward of Ireland. One of the convoys contained one of our troop ships, the *Pawnonia*, and this vessel had to travel for some time in the zone without escort, as it was too rough for the destroyers to get to the rendezvous. These are risks that may be expected.

10. I do not see the desirability of routing our transports to the southward in order to permit destroyers to cross with them. Bad weather will be encountered to the southward, and if an area is selected where good weather prevails, this is precisely where the cruiser submarine would most likely be found. I should recommend that this idea be abandoned.

11. If it is decided to provide one or two destroyers to escort our convoys all the way across, it would seem logical to base a force on the Azores. However, destroyers based on the Azores will need many repairs beyond the capacity of a repair ship or the resources of the Azores. I am afraid the scheme is hardly practicable during winter weather.

12. My recommendations are these:

(*a*) That a limited number of destroyers be retained in the United States for escorting our troops off shore, so as to protect them against any large submarine that may be operating off the port of embarkation.

(*b*) That the routes of our convoys be varied so as to deny the enemy information of any one line of approach.

Digitized by Google

(c) That an ocean escort be provided sufficient to withstand any raider that escaped to sea. This will mean a dreadnaught in the event that we get information of the escape of enemy battle cruisers or else sailings will have to be temporarily suspended.

(d) That all escorting vessels should have guns superior to 6-inch.

(e) That all convoys be routed through the North Atlantic, as before.

(f) That any destroyers be released that can be spared for operations on this side, so that greater protection can be given in the area where the danger is greatest.

13. It is unfortunate that at the very time that our larger transports come into operation the number of men that Field Marshal Haig wishes to send on leave is greatly increased. We have, as the department knows, a limit now of 600 arrivals a day in England, or 5,000 a week. If we can provide from the United States some fast shallow-draft transports of 18 knots or upward for cross-channel service, we can assist materially to relieve the congestion.

14. The British war office are striving to comply with Sir Douglas Haig's wishes and to increase the number of men on leave. If the leave requirements are fully met, it will mean that practically none of our troops can be handled into England unless we can provide some fast steamers for cross-channel service. I consider this matter a very urgent one. An inquiry has already been sent by cable indicating the types of ships needed. I think perhaps both the *Harvard* and the *Yale* could be used and perhaps some others of a similar type could be found.

15. Aside from the question of handling our large transports, there are a number of British liners crossing that can be utilized for carrying our troops. This is a great saving in tonnage to us and a great convenience to land troops in England, for the French ports are very poorly developed, and all the assistance we got from the English ports is helpful. I have repeatedly pointed out, however, the desirability of sending no freight via England, only troops and kit; but despite my recommendations the freight still rolls in, embarrassing the situation more than ever. I had hoped to arrange for our first lot of large transports to come direct to England; but I find that in addition to troops and kit these vessels contain some 4,000 tons of freight for France. The department will understand that this additional amount of work thrown on the cross-channel service is most serious and can not be handled at present. As a result, these vessels could not be received in England. As a compromise I have suggested to the department the desirability of lending these ships with freight for England, the freight carried to be determined by Mr. Guthrie, the allied shipping representative in America. It is possible that wheat or some nonexplosive freight could be carried in these large ships and these vessels routed direct to Liverpool; but this is contingent upon our help in furnishing steamers for cross-channel service.

16. I consider Liverpool the safest port of entry in the submarine area. For the present, however, I think we shall have to send our large ships to Brest roads and then, when they are unloaded, escort them into England to be coaled.

17. I have previously reported against using the *Vaterland* for the present until we have a little more experience in handling the other large transports. The *Vaterland* is of course a much longer target, and injury to her would be a serious affair. I am assuming too that all of the troops that we have to transport for the next few months can be accommodated in other transports, assisted by British liners. Whenever the situation becomes pressing I presume we shall have to use the *Vaterland* and take the additional risk.

18. British destroyers would escort all our troops sent in British liners. Queenstown destroyers (our own) escort all our troops in regular convoys and also escort to France all supply ships in convoys sailing from Hampton Roads or Sydney. British destroyers escort to a position near Brest all our store ships in New York convoys.

19. Forces based on Brest escort into France to storeships in New York convoys that are carried by British destroyers to a rendezvous near Brest. The Brest forces also distribute our storeships to their destination along the French coast, and escort out of French convoys of empty vessels. It will be noted that the great bulk of our work is done by our Queenstown destroyers, and that the forces based on Brest do principally coasting work, and for escorting out our empty vessels.

20. At the present time, as we have things organized, we can handle one troop convoy every eight days. If six or eight vessels are sent in a convoy averaging 15,000 troops per convoy, this would mean approximately 60,000 troops a month direct to France with the addition of some 15,000 or 20,000 troops a month through England in British liners under the present arrangement.

21. To bring the troops in at a faster rate will require more destroyers on this side, and any considerable increase in storeships will also require more destroyers.

22. With reference to the use of submarine versus submarines, this matter has been given more attention since the establishment of convoys. Formerly the system in use was patrol surface craft of sea routes. With this system it was rather difficult to work submarines except in limited areas. Now that a large part of the patrols have been

Digitized by Google

withdrawn in order to provide escort for convoys, there is considerable area open for the employment of submarines versus submarines. I believe the system will never be very effective so long as the attacking submarine must rely on torpedoes, owing to the difficulty of maneuvering into position to attack the enemy submarine. But a type of submarine which is now being built in England, of which Lieut. Pierce has the sketch drawings, provides for the use of guns against enemy submarines. I am hopeful that this method of attacking enemy submarines will give much better results. There is no doubt that the presence in waters of our submarines makes the problem much more difficult for the enemy, and already a number of German submarines have been sunk by British submarines. The presence of our submarines in the Azores will have the effect, I think, of keeping enemy submarines away from that immediate area.

POSSIBLE BATTLE CRUISER RAIDS.

If there is any further doubt in any one's mind as to the extreme danger of imposing war plans from a distance of 3,000 miles, the narration of the case that I am now going to take up should clear it away. It should make clear that, in so far as a statement recently made before this committee by the Secretary of the Navy carried the implications that my position abroad was a purely local one, and that general plans and policies were not any of my business, the statement was inaccurate.

Apart from the case now to be considered, I am sure the committee must have been impressed with the extent to which the execution of departmental plans were required of me, whether I originated them or not. As a matter of fact, as I have stated repeatedly in this testimony, my principal mission throughout the war was in connec- with departmental plans and policies. As you have seen, I was constantly called upon for advice and directed specifically to take up and discuss with allied leaders this and that question of plans and policies.

In the spring of 1918, as the losses of merchant tonnage in the submarine campaign were falling off month by month and it had become apparent that the submarine campaign against shipping was being defeated, the allied naval staffs again became apprehensive that the Germans might, as a last venture, send out their battle cruisers as raiders in the hope of meeting and completely destroying some of our convoys, or of compelling the abandonment of the convoy system. I might say that it was a surprise to the Allies that the Germans had not done this long before, if only for the confusion it would have caused the Allies and the disturbance in the convoy arrangements that would inevitably have resulted.

The planning section of my staff in London, which had been established upon my recommendation and after approval given by Admiral Benson during his visit to London in November, 1917, had thoroughly examined the probable conditions of such a raid and had, in conjunction with the plans division of the British Admiralty, drawn up a plan to meet it. A copy of this plan was forwarded to the department on June 20, 1918.

On July 2, 1918, I received the following dispatch from the department:

SIMSADUS.

Simben 3. Your 307. As last hope. German battle cruisers may be sent out to completely destroy one of our large troop convoys. We depend upon you to gain and give information on this point, and Grand Fleet to take necessary action until United States could act. 11001. Simben 3.

BENSON.

Digitized by Google

I would like to explain right here—I think I have not made the explanation before—that any message that is marked "Simben" was sent with an agreement which I understood to be that the message would be delivered directly to Admiral Benson and nobody else; and any messages coming to me on the other side that were addressed to "Simben," that meant that they had been sent by Admiral Benson and not necessarily anybody else.

I would like to add in further explanation about "Simben" messages that they were sent in a separate code. There was only one officer in the Navy Department who had that code and could translate it, and there was only one officer in my quarters who could similarly translate messages coming the other way. That was to secure extra secrecy to the important messages sent in that way.

The CHAIRMAN. Was that code changed from time to time?

Admiral SIMS. Yes; that code was changed from time to time, but only those two people knew it.

To this dispatch I replied as follows on July 2:

Simben 11. Referring to your Simben 3. All possible measures will be taken to gain information of prospective and actual movements of enemy vessels. Grand Fleet and other British vessels and United States vessels in these waters will be prepared to act within the limits of their capabilities. Notwithstanding all that may be done, it is impossible to guarantee that enemy battle cruisers will not gain the high seas, and it is therefore apparent that battle ship escorts for convoys constitute their only real safeguard. Attention invited to planning section memorandum No. 26, forwarded with letter No. 21969, June 20, 17002.

SIMS.

By this time the department was evidently becoming alarmed, as is indicated by the following message received about a month later, namely, July 28:

Simben.
Simsadus.

No. 7. Department feels very apprehensive of at least one enemy battle cruiser getting out as forlorn hope and attacking United States naval vessel convoys. It is proposed to send three oil-burning dreadnaughts to Berehaven or Queenstown to be in a position to protect convoys, depending upon British to give us information immediately of the exit of cruisers from German waters. Comment and recommendations requested as to the better of the two places to send them and have adequate protection against submarines. What do you think of our mine force extending at once at least one line of mines all the way across to Norway? 24027, No. 7.

BENSON.

I replied immediately by stating that Berehaven seemed the better base for the dreadnaughts which the department proposed to send.

Replying to this on July 30 the department outlined a new and complete plan of their own for the protection of shipping against battle-cruiser raid. I insert the dispatch in full, but as it is long and technical I will not read it, but will refer to and explain certain of the defects of the plans proposed. The dispatch is as follows:

[Highly secret.]

Simsadus.

Simben 8. Reference planning section memorandum 26, battle-cruiser raids. The department is of opinion that raid by a battle cruiser against the supply lines to European ports, particularly against troop convoys, is a possibility, and that even if the chance is remote it should be guarded against. The department further notes that the decision arrived at as modified, by the action actually contemplated by the Admiralty, while safeguarding ships leaving port after notice of the escape of an enemy battle cruiser has been promulgated, is in the nature of a negative decision and affords only partial relief to ships then in transit between United States and European ports. The department further proposes the following definite plan for consideration and

Digitized by Google

action. General plan to be applicable to United States troop convoys, cargo convoys to French bay ports, and convoys carrying United States troops, other convoys to utilize plan if considered advisable by Admiralty. Plan drawn on line of battle cruiser escaping by way of North Sea around north end Scotland, though with slight modification it is applicable also to enemy battle cruiser escaping from Black Sea. Definite information of escape of enemy should be given to all forces before enemy has crossed Scotland to Iceland lines or has gotten clear of Aegean Sea. Plan applicable to both eastbound and westbound ships. Specific details: The Navy Department has asked the State Department to request of Japan that she detail a battle cruiser to * * * with the Atlantic Fleet at Hampton Roads. The North Atlantic to be divided into three areas: First, west Atlantic, longitude 45° west to United States coast; mid-Atlantic, longitude 20° west to longitude 45° west; east Atlantic, longitude 20° west to east Atlantic destination. The United States to station Division 6, consisting of U. S. S. *Utah*, U. S. S. *Nevada*, U. S. S. *Oklahoma* at Queenstown or Brest, preferably the former port or vicinity, to act as raider guard against battle cruisers in the mid-Atlantic and east section. To hold the Fifth Division, consisting of U. S. S. *Arizona*, U. S. S. *Mississippi*, U. S. S. *New Mexico*, U. S. S. *Pennsylvania*, to cover the west Atlantic section or to proceed where necessary. To use the Japanese battle cruisers, if they are detailed to work with our forces, for the purpose of direct pursuit. Eastbound convoys: All convoys between longitude 45° and United States return to nearest United States or Canadian port, there to await adequate escort. Furnish two old battleships as escorts for each convoy carrying troops.

If practicable, extend the same escort to cargo convoys, and where this is not practicable use two armored cruisers for escort to cargo convoys, all convoys east of meridian longitude 20° proceed to destination at top speed, convoys between longitude 45° west and longitude 50° west diverting immediately to Azores Islands and make for an anchorage or less under Island San Miguel; convoys between longitude 30° and longitude 20° diverting to San Miguel or proceed to destination or nearest port as circumstances demand, depending upon estimated position of enemy cruisers relative to position and speed of convoys. Westbound shipping: Ships between longitude 15° west and European ports return to port to await adequate escort or divert to San Miguel, Azores Islands, depending upon submarine situation; ships between longitude 15° west and longitude 45° west divert to Azores Islands or to nearest United States or Canadian port, depending upon their proximity to those points. Ships westerly of longitude 45° west route to destination or to nearest port. Utilize U. S. S. *Delaware* and U. S. S. *North Dakota* with Division 3, Division 4, Division 5 battleship force to escort troop convoys; utilize cruiser force to escort cargo convoys; hold Battleship Division 8 with one destroyer division instantly ready to proceed; dispatch Division 6 with two destroyer divisions in European waters to proceed at top speed to Azores Islands, San Miguel. Use Japanese battle cruisers as pursuit division if they are detailed to cooperate with United States forces and if such plan is agreeable to them. Above plan to become effective immediately upon agreement and to be put into operation upon receipt of broadcast radio and cable stating that enemy battle cruiser had escaped from North Sea. The department to maintain adequate supply of coal and oil in European waters and Azores Islands to meet the logistic needs of Battleship Division 6. This above plan is suggested as a possible counter to any enemy battle cruiser or small force of enemy ships escaping from North Sea and attempting to raid our lanes of communication before internment in some neutral port or escape to other seas.

Modification suggested for raiding force escaping from Adriatic Sea or Dardanelles ships east or west bound between meridian longitude 20° and longitude 45° and north of latitude 45° proceed to destination or the nearest port at top speed. 10030.

BENSON.

Briefly stated, the department's plan provided that one division of battleships was to be stationed at Queenstown, to cover the eastern area of the Atlantic. Another division was to be held at home waters to cover the western Atlantic. A division of Japanese battle cruisers was to be requested to base on a United States port, and conduct direct search operations. Upon the warning being given, eastbound convoys in certain general sea areas, were to return to the nearest United States or Canadian port. All convoys in the eastern part of the Atlantic were to proceed to destination; while convoys in mid-Atlantic were to be diverted immediately to the Azores. For westbound shipping about the same procedure, re-

Digitized by Google

versed, was to apply. After the battle cruiser was out, in fact, after the trouble was on, another division of battleships was to be detailed to escort any troop convoys which were then to move. The plan was to become effective only after receipt of information that the battle cruiser had, in fact, escaped from the North Sea.

The plan was impracticable for numerous reasons, and it was eventually abandoned with the full concurrence of the Navy Department and before any necessity for its application arose; for it was substituted a plan substantially the same as that previously recommended by the planning section.

I will explain briefly some of the undesirable features of the department's plan:

(*a*) Most serious of all, it was not a joint plan—that is, it provided for American troops and shipping only—a small portion of the whole—and could not be made applicable to all allied shipping. One can imagine the confusion in the Atlantic of attempting to handle allied convoys and shipping with conflicting wireless instructions by other than a joint plan.

(*b*) It upset the whole delicate allied machinery for providing destroyer escort through the submarine zone. That is, in attempting to guard against an enemy battle-cruiser raid it subjected shipping to added and unnecessary risk of destruction by submarines. It was quite impossible for the department to know of the extensive and delicately adjusted system in London for providing protection against submarines for all allied shipping. The system was constantly changing as new forces or additional convoys were added.

(*c*) It was based on an erroneous premise, namely, that we could be sure of counting on advance knowledge of the escape of a battle cruiser. I had repeatedly reported that the Allies could not guarantee any such information. While we could and did track the progress of submarines quite accurately, a battle cruiser at high speed could make its escape from the North Sea in one night, taking advantage of fog or heavy weather, with small chance of being detected.

(*d*) If a false alarm of the escape of a raider were given, and such a case actually occurred after the latter plan had been adopted, the system of controlling shipping would be so deranged that it could not be put back into normal operation for some time. Consequently there would be increased opportunities for submarines to attack unescorted convoys and shipping as well as unnecessary delay to shipping.

I would like to invite attention at that point to one of the gravest dangers that can be inflicted upon the people who are doing the fighting, by the people at headquarters; that is, that they at headquarters should, in the pride of intellect, draw up a plan to be executed by the people at the front, and thereby incur the danger of drawing up that plan on a false premise. That was done twice during the war. In one case it is my conviction that it cost us at least half a million tons of shipping. It was the premise which enabled them to draw up the perfectly erroneous estimate of the situation that one of the best things to do was to depend upon arming merchant shipping; and it was that which caused the delay of the convoy system for approximately three months. The false premise in this case—and it was exceedingly dangerous—was that we would be sure to be

Digitized by Google

able to tell them when the battle cruiser went out of the North Sea. As a matter of fact, we never were sure, the premise was wholly false. Consequently, the estimate of the situation was wholly false; and consequently the department's plan was wholly impracticable. If that lesson can come out of all this trouble and expense we have gone through, it will be something that will be of value to the United States Navy and this Government in the future.

I replied to the department's dispatch as follows:

Date: August 3, 1918.
To: Opnav.

[Simben.]

Urgent. Simben 21. Your Simben 8. I believe it extremely dangerous to base a plan on assumption that information of enemy's escape will be obtained, otherwise than through news of attack. There is certainly a small chance that this information will be available, and, in long nights of winter, chances will be very much against this early information. I believe safety requires plan should be based on assumption that one or more battle cruisers will be at large in Atlantic, with ample fuel supply, and in a position to attack convoys, before we have any knowledge of their existence from home ports. Only possible protection against this danger is battleship escort of convoys, inaugurated before the danger arises. This would subject the battleships to a relatively small risk of being torpedoed, as compared with the great risk of one or more convoys of many thousand troops being destroyed before measures could be taken to protect them. I have consistently advocated this plan, and am convinced that no other can offer the same certainty of protection to troop and other convoys. The following comments are submitted on the department's plan, as set forth in its cablegram:

Assembly of large number of merchant ships at Azores dangerous, because of possible submarine attack, and extraordinary marine risks due to assembly so many vessels. Think general principle of action should be to keep all convoys moving toward destination. To turn back shipping, or to deflect it toward other than terminal ports, would make antisubmarine escort impossible in many cases, and would introduce refueling difficulties that would tie up many vessels until fuel could be sent to them.

Battleships based on Irish port, as proposed, would be available to escort to safe positions such troop convoys as might be in danger area when alarm was given, and this is deemed a safer plan than to have such convoys proceed to destination unescorted, or to have them proceed to Azores. If department should decide to adhere to its plan of having battleships go to the Azores to furnish escort to shipping assembled there, it is suggested that the Tagus River would be a better base than an Irish port, being 300 miles nearer the Azores.

When department has decided on general principle of plan, I will take up whole question with British Admiralty. Final plan must be a joint plan, taking cognizance of all allied shipping. 22005.

SIMS.

I might say there, in explanation of the sending of a vast number of ships to the Azores, and the plan of sending a dozen destroyers out there to protect them, if there had been ten or one hundred times the number of destroyers sent to protect them, everybody on the other side that had anything to do with this war against submarines would have known that no possible number of destroyers will ever protect a vessel that is standing still, at anchor.

The case of the British vessel *Justicia* illustrated that perfectly. was torpedoed and not sunk, and they had 5 tugs and 17 destroyers She was bound out of the channel from the North Sea when she and all the vessels in the neighborhood circling around her, and they were dropping depth charges, and so forth, and yet they could not prevent her from being torpedoed, because she was not moving more than a mile or a mile and a half an hour.

Digitized by Google

The department, however, replied with a long message, insisting upon their original plan. I insert the message in full, but will not read it:

Origin: Opnav, Washington. Ser. No. Simben 11.
Date: August 7, 1918.

[Highly secret.]

Simsadus.

Simben 11. Your 21. Our 8. The details of the plan drawn by the department were laid down to accord in general with the decision of your planning section as revised by the Admiralty planning department. As to your first point, viz, that safety requires plan should be based on assumption that one or more battle cruisers will be at large in Atlantic with ample fuel supply and in position to attack convoy before we have any knowledge of their exit from home port, this statement seems to be in contradiction to statement in F. D. O. 80, paragraph 5, and opposed to the actual information which you have from time to time furnished us. It is, however, so important a point that a direct statement should be had from (?) the Admiralty as to their ability to provide the necessary information. You will notice in our plan that it is department's intention to furnish old battleship escort to number of two for such important convoy when necessity arises, but there have been many reasons why we did not wish to do this in advance of the necessity, one being that we did not desire to give advance information to the enemy, as to one of the most important elements of the plan, and thus give him the opportunity to plan an answer. In this matter also you should get a direct statement from the Admiralty, as to the advisability of our using our predreadnaughts for escort and when the operations in their opinion should go into effect. With regard to the rest of our plan and your comment on same: Even when battleship escort is provided this in itself on account of its fixed character is still only a partial answer and can be countered by the enemy by an increase in power of his raiding force. It therefore becomes necessary to provide for further contingencies, and this the plan submitted attempts to do.

It differs only from the decision of your planning section in introducing the scheme of premeditated diversion. In general on account of the few dreadnaughts available, their slower speed than that of battle cruisers, the number of convoys to be protected, and the great area over which (?) these convoys operated, it seemed first necessary to divert according to a plan which might at same time get our dreadnaughts in touch with battle cruisers and afford greatest protection with minimum number of convoy ships. Second, nothing in the above prevents department from immediately proceeding on the plan of evasion by warnings either before or after the premeditated plan is operative; and, lastly, as a final resort, it is always in the province of the escort commander to scatter his convoy. Therefore the department still adheres to its predetermined plan, introducing the element of evasion by warnings; and, lastly, proposes that the movement to scatter be left in escort commander's hands, as last resort. The department prefers to base division 6 many points of view. U. S. S. *Oklahoma* and U. S. S. *Nevada* will sail in a few days. The plan above outlined will apply to our troop convoys to France and to the direct cargo convoys to French bay ports. It is desired that this plan be taken up immediately with Admiralty to get their concurrence as to HJ and HC convoys carrying our troops, or for such modification of the plan as they suggest. 18006. Simben 11.

BENSON.

N. B.—The words evidently omitted in coding, as blank spaces indicate.

The gist of the reply was that it was apparently hard for them to believe the specific statement that the Allies could not guarantee getting advance information of the escape of a raider from the North Sea. That, to us, was one of the most astonishing things done during the war, the conclusions drawn in that way. Frequently I have encountered civilians who would say to me, "It does not seem to me that you would have much trouble in blocking up that North Sea." I would say, "How wide do you suppose it is up there?" They would make a guess, anywhere from 15 to 50 miles. Their mental picture of the thing was a little map in the geography that they studied in school, and when you told them that it was 240 miles across and 900 feet deep, then they began to think about it.

Digitized by Google

In their messages they asked me to confirm the statement about the Allies getting advance information of the escape of the raider from the North Sea.

They also stated that there were many reasons why they did not wish actually to put battleships with convoys, in advance of the necesssity, one being that they did not desire to give advance information to the enemy as to one of the most important elements in the plan. They opposed the recommendations to but the battleships with the convoys, saying that this would be put a partial answer, and would be countered by the simple expedient of increasing the power of his raiding force. It may be well to state that the main thing we were providing against was the escape of a single raider, which would be very difficult to run down. If the enemy were foolish enough to send out a heavy battle cruiser force, it would play directly into our hands, as it would at once warrant a corresponding heavy detachment from the British Grand Fleet, to say nothing of our own fleet. The case was complicated, because the number of United States convoys involved were very small indeed, compared to the number of allied convoys.

It was really astounding to me that the department would consider diverting a large number of ships to the Azores, where there was no inclosed anchorage; they would practically have to anchor in the open sea—not to mention the complications which would be introduced by the necessity of sending many other ships to supply them with fuel and provisions before they could continue their voyage, and of providing destroyer escorts from the Azores, through the submarine danger zone to destinations.

It was difficult enough to send destroyers out from the coast of Ireland or England, 200, 300, or 400 miles. to meet convoys and bring them back again. To send destroyers from Queenstown all the way to the Azores required refueling there before they could proceed, required nearly double the number of destroyers before they could do it, etc.

My attitude in the matter was summed up in a personal letter of August 10, 1918, to Admiral Benson, of which I will read you the pertinent paragraphs:

AUGUST 10, 1918.

MY DEAR ADMIRAL: I have just received your second cable about the measures proposed in case the German battle cruisers come out. I will take this up at once with the Admiralty, and will of course telegraph the answers to the questions you ask.

It seem to me that there is only one vital decision to make in solving this problem, and that is as to whether or not it should be based upon the assumption we will get warning of the battle cruiser coming out, or as to whether we will not get warning. In the latter case our first intimation will be an attack on the convoys.

An examination of the planning section's estimate, to which you refer, will show that it is really based upon the assumption that we would probably not get the information. At all events, it seems to me that any problem of this kind, should, in the interests of safety be based upon the worst that the enemy can do.

I have never thought it very probable that the German battle cruisers would come out to attack convoys, because I do not think it would pay them, as I have always understood that, whether they win or lose, they would want to be in possession of their fleet in as great a force as possible when they come to the peace negotiations.

I may say right there that all through Admiral Von Tirpitz's book he expatiates upon that scheme, that the prime minister at that time

Digitized by Google

insisted upon having the fleet preserved, while he wanted to use it. [Continuing reading:]

This statement about preserving the fleet until the end of the war was made within two weeks after the war was declared, in 1914. It may not have been authoritative, but it was made by the officials of the German Embassy, who were at Newport at the time, and was promptly reported in Newport by one of the retainers.

As to whether we would be likely to get warning of the exit of a battle cruiser, I have often talked over this with the officials of the Admiralty, and it was discussed recently at one of the morning conferences. It was agreed then that the probability is that a battle cruiser could get out without being detected; also that if she was detected she would not continue on the way out, though we would not be sure of this, and of course the proposed plan would have to be carried out.

Considering the distance across the North Sea, the position of the Grand Fleet on the western shores of the North Sea, the proportion of bad weather and fog, and the limitations as to the use of oil, it does not seem to me at all likely that the attempted exit of a battle cruiser would be discovered. It therefore seems to me that it would be only ordinary prudence to base any plan for the protection of our troop convoys upon the assumption that we will not know of the exit of the cruiser until an attack has been made.

Some of the people in the Admiralty have expressed the opinion that a battle cruiser coming out for this purpose could not remain out long and would almost surely be detected upon attempting to return. have always dissented from this opinion, and in our last discussion of the subject it was apparent that the Admiralty officials now think it more than likely that the battle cruisers would not go out without having a certain amount of coal in vessels that had been dispatched for that purpose.

It has always seemed to me that by the expenditure of a sufficient amount of money coal could be cleared from almost any country for perfectly innocent ports, and arrangements made to divert the cargo and anchor it in many places where it could be used and where there would be very small chance of its detection. I should expect a battle cruiser, once out, to have facilities for recoaling at least for a considerable time. This would, of course, be a serious matter—so serious that it would seem that the plan would be based upon this assumption.

Of course, if a battle cruiser did go out and we had no warning of her, the chances of her finding a convoy out in the Atlantic would be small. It is assumed that she would not search for a convoy close to the European coast, where convoys converge toward their ports. This would be too dangerous a proceeding, as she could hardly cruise in these waters without being detected, and in that case she would be in great danger of being run down by British battle cruisers, particularly if one or more destroyers got contact with her and kept contact.

It is therefore assumed that she would take to mid-Atlantic or appear off our coast, where there are no battle cruisers. The chance of encountering a convoy in mid-Atlantic would, of course, be small. If we knew she had just left the North Sea we could take measures to protect the convoys, but if we did not get this warning we would probably lose some one or more convoys before the necessary measures could be taken.

It is for this reason that I have always advocated our battleships being used for the ocean escorts of our troop convoys. While I have never been particularly apprehensive as to the battle cruisers coming out, I was always apprehensive that a raider might come out carrying one or more guns heavier than those of our cruiser escorts.

The CHAIRMAN. Admiral Sims, I have certain matters that I must attend to before the Senate meets, and the committee will therefore have to adjourn now until to-morrow morning.

Admiral SIMS. Yes, sir.

(Thereupon the subcommittee adjourned until to-morrow, Tuesday, March 16, 1920, at 10 o'clock a. m.)

Digitized by Google

NAVAL INVESTIGATION.

TUESDAY, MARCH 16, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman) and Trammell.

The CHAIRMAN. The committee will come to order. Admiral Sims, will you proceed?

TESTIMONY OF ADMIRAL WILLIAM S. SIMS—Resumed.

Admiral SIMS. I was explaining yesterday that I had always advocated our battleships being used for ocean escort of our troop convoys. While I had never been particularly apprehensive as to the battle cruisers coming out, I was always apprehensive that a raider might come out carrying one or more guns heavier than those of our cruiser escorts.

On August 17, 1918, I sent the following dispatch to the department:

[Simben.]

Simben 28. Your Simben 13. Matter was referred officially to Admiralty August 8. No written reply yet received, but from discussion with Admiralty staff I can say that they do not believe that their information service is such as to make the probability great of securing information of the exit of an enemy raider from the North Sea. Similarly, I can say that the Admiralty opinion is that battleship escort should be provided for convoys whenever there is thought to be possibility of the escape of a raider, and that the provision of such escort should not be deferred until the raider is known to be out.

SIMS.

But the department continued to insist upon the plan which they had previously suggested.

The first intimation of the probability of a German battle cruiser raid was manifest at the end of August, 1918, when information was received simultaneously from a variety of sources that two heavily armored cruisers might soon attempt to enter the Atlantic to attack American troop convoys. In the face of this we had no plan, although plans had been urged since September, 1917. The department's action to meet this situation was to adopt my repeated recommendations and assign battleship escort to convoys, together with certain parts of their own plan concerning convoy routes. They deferred putting their own complete plan into operation until more definite information was available.

Digitized by Google

This is indicated by their message to me of 31 of August, as follows:

[Highly Secret.]

824. Plan outlined our Simben 8 and 11 for protection against battle cruiser raids, and instructions one of Commander Force European waters, will become effective upon receipt of this cable so far as plan for diversion of routes is concerned. Beginning with September 9, battleship escort will be given to the HX, HC and United States troop convoys, in order of importance named. Until system of battleship escort is thoroughly in hand, it is probably that some convoys will sail without additional battleship escort. You will be informed when this happens. To put the entire plan into active operation if it is so desired, when information is gained of the escape of a raider, the following radio or cable will be sent by Sims and by Opnav, "Battle cruiser raid plan operative." 14030. 724.

BENSON.

6.52 a. m., August 31, 1918.

The mixture of plans, the inevitable difficulties of coordination to be expected from the department policy of divided control and responsibility, was immediately apparent.

I have before me and insert in the record a long message from the department, of September 4, pointing out the confusion which had resulted.

The message referred to is as follows:

Origin: Opnav, Washington.
Ser. No. 857.
Date, September 4.
31 ADR.
Simsadus.

[Secret.]

857. Your 3959, 3947 and 3937. The disinclination of the admiralty to divert HX and HC convoys in accordance with our plan naturally weakens it. Since protection must be afforded HX and HC convoys as they carry our troops your plans to use division 6 for the protection of HX and HC convoys as indicated in 3947 approved but the United States troop convoys diverted to Azores Islands according to our plans must receive the protection of at least one of our dreadnaughts from division 6. Therefore until joint agreement is reached we will expect the United States troop convoys and the HB to be diverted and the HX and HC to proceed. If department finds according to this arrangement which scatters our force we will be unable to adequately protect all the troop convoys it may be necessary to urge upon the War Department the advisability of discontinuing sending troops in the HC convoy. As no joint agreement has been reached convoys at sea are not familiar with our plan and United States convoys must be given diverting instructions, but on receipt of this issue instructions to all transports.

United States men of war and escort ships in European waters make themselves familiar with necessary details. Also furnish all American merchant vessels with sealed order to be broken in case of receipt of operating signal as prescribed, whereby westbound ships may avail themselves of protection if desired. The operating signals will be sent in a United States code to American ships only. Beginning with September 9 it is department's plan to furnish predreadnought escort to the HK and HC convoys, whose captain will be familiar with our plan, but will not use it unless Admiralty so desires. Commander cruiser force will issue similar instructions to ships on this coast. Finally, this plan is only a temporary expedient and does not solve the problem of continued activity of an enemy battle cruiser in the North Atlantic. Escort by battleships will protect troop convoys against the ordinary raiders, but the cargo convoys will still be lightly protected. Our dreadnoughts are too slow for an efficient pursuit division, and no answer has been received from Japanese on our request that they send four battle cruisers to base with our fleet. Department desires to know what will be the Admiralty policy as to the use of their battle cruisers for pursuit in case of the escape of an enemy battle cruiser 18503. 857.

BENSON.

September 4, 1918, 12.06 p. m.

Digitized by Google

It is an impressive example of the deplorable absence of unity of command on the seas, a measure which the Allies finally adopted on land, and which made victory possible. The message is too long to read. I note such statements as the following: "As no joint agreement has been reached, convoys at sea are not familiar with our plan"; "This plan is only a temporary expedient and does not solve the problem of continued activity of an enemy battle cruiser in the North Atlantic"; "No answer has been received from the Japanese"; "Department desires to know Admiralty policy as to use of their battle cruisers."

There is nothing to be gained by examining this situation in order to try to determine who was right or who was responsible for the confusion. The point is that it was wholly impossible even to attempt the preparation and execution of extensive and complicated Allied plans, with the plan makers, the members of the team, separated by over 3,000 miles of ocean, and the discussions carried out over a heavily overworked cable. It was attempting the impossible. Judging from all other experiences in the war, a few hours of joint personal discussion between the parties concerned would have resulted in complete agreement. But the issues at stake were so serious that something had to be done, no matter how impossible it seemed, to straighten out the tangle.

I therefore discussed the situation with the heads of the British Navy, and proposed that my staff get together with the British planning staff, and, regardless of difficulties, produce, in the shortest possible time, the simplest possible joint plan, which they believed would be acceptable to our department. (These planning sections had been collaborating since May.)

I have the plan before me and insert it in the record. It is as follows:

Date September 10, 1918.
To Opnav.

[Highly Secret.]

Your 857. Instructions to United States merchant vessels and to United States naval forces have been issued as directed. Admiralty propose to use their battle cruisers to bar the return of enemy raiders, and do not propose to use them for pursuit of raiders in the Atlantic.

I recommend the adoption of the following joint plan which has been prepared jointly by my staff and Admiralty Plans Division, and has the approval of the admiralty:

The following plan shall govern all vessels and convoys at sea after they have received warning of a raid.

PLAN.

1. Raider warning shall not be sent out without mutual consent of Navy Department and admiralty, unless evidence is conclusive that raider is out.
2. As a rule convoys and supporting forces will be handled by radio from the Navy Department or the admiralty.
3. The aim will be to continue all voyages and to provide all convoys that are in danger with battleship escort by sending battleships from Halifax and Berehaven to overtake or to meet convoys not already escorted by battleships; and by combining convoys of approximately equal speed.
4. Battleship escorts will leave eastbound convoys and join westbound convoys as indicated by the situation, getting all their fuel in American ports.
5. During a raid all operations west of longitude 40 shall be controlled by the Navy Department, in consultation with British C-in-C North Atlantic and West Indies, and all operations east of longitude 40 shall be controlled by the admiralty in consultation with the commander, United States naval forces, Europe, with complete interchange of information received and orders issued.

Digitized by Google

6. The ordinary machinery for routing shall continue in operation except that orders to convoys and escorts at sea to avoid raiders shall be sent direct from the Navy Department and the admiralty to save time. Base commanders concerned shall be informed of orders issued.

7. Special rendezvous routes to be used in the case of a raid in the absence of radio instructions will be given each convoy unescorted by battleships before sailing, and battleships will be sent out from Berehaven to join the convoys.

8. Commanders of battleships at Halifax and at Berehaven, and all commodores of convoys and commanders of escorts, shall be given the routes of convoys sailed or about to sail, together with the latest information on the submarine and raider situation.

9. Destroyer escorts will accompany Berehaven battleships when practicable.

CONVOY INSTRUCTIONS.

1. Raider warnings and all subsequent communications will be made in convoy cipher. Reports of enemy position will be broadcasted by shore stations.

2. Convoys shall listen in for radio instructions, but in their absence on receipt of warning the following shall govern:

(*a*) Notwithstanding these general instructions, special vessels and convoys are given full discretion as to action taken to evade the enemy, when danger is imminent.

(*b*) When practicable convoys should seek to escape in the general direction of their destination.

(*c*) As a final resort convoy commanders when insufficiently protected may disperse t heir convoys.

(*d*) Maintain radio silence except that senior officers' ship shall:

(1) Report position and movement of raiding force if sighted.

(2) Relay to shore stations such reports if deemed necessary.

(3) Communicate rendezvous signals unless safety of convoy is thereby endangered.

EASTBOUND CONVOYS.

(*e*) Convoys escorted by battleships will continue their route.

(*f*) Convoys unescorted by battleships in the absence of radio instructions will get on rendezvous routes and follow them.

(*g*) Battleships will be dispatched from Berehaven to join convoys unescorted by battleships.

(*h*) Convoys for which no battleships escorts are available may be ordered by radio to join escorted convoys.

(*i*) A separate rendezvous route will be assigned for convoys bound to:

(1) French ports.

(2) English and St. Georges Channels.

(3) North Channel.

WESTBOUND CONVOYS.

(*j*) Convoys will, if practicable continue their voyage.

(*k*) Westbound battleships will give such protection as practicable.

SOUTHERN CONVOYS.

(*l*) Should proceed on their voyage unless ordered to port.

4523. SIMS.

This plan was simple, and, in substance, was identical with my previous recommendations.

Briefly stated it was, that the moment any possibility of a raid developed, the battleships at both ends of the line would put to sea and pick up and escort the nearest convoys believed to be in danger. That, as far as possible, and in order to make up for the lack of battleships, an attempt would be made to combine convoys. That the department would control all shipping in the western Atlantic, and the British Admiralty all in the eastern Atlantic, by direct radio communication with the convoys and battleships.

That the battleship escorts would not attempt the complete passage, but those in the eastern area, after reaching a central point, would pick up an eastbound convoy and return. It contained many other

Digitized by Google

details as to methods of routing, control, and communication. Generally speaking, however, all convoys were to keep going. The scheme of diversion to Azores was abandoned.

The department finally recognized the impossibility of carrying out their own plan, for on September 21, 1918, I received a dispatch, informing me that they had accepted the plan that I had proposed, and which I have just explained. The dispatch was as follows:

[Secret.]

Origin: Opnav., Washington. Series No. 1869.
Date: September 21.
53 ADR.
Simsadus.

1860, 6974. 4523, 4885. Plan for meeting raider menace approved, and will be substituted in place of present plan. For the present, our division 8 with duty corresponding to division 6, will base at Hampton Roads, though later some ships of the division may base at Halifax. Issue necessary instructions to put this plan into effect, and furnish department with rendezvous route. Directions will be given to commander in chief, and commander cruiser force, to issue instructions from this end putting plan into effect immediately after. Though plan does not embrace westbound shipping proceeding independently, department infers that the provision of paragraph 3, first sentence, your cable 4523, will hold, and that, if necessary, westbound shipping will be guided by warning received, and by any subsequent instructions broadcasted, is this correct? 21020 1869.

BENSON.

N. B.—No record this office of 6974.

Fortunately, the enemy never attempted a battle cruiser raid. To any one at all familiar with the case, it is, to put it mildly, disquieting to contemplate the confusion of all Atlantic shipping, naval and merchant, stoop carriers and all, which would have resulted if a raid had occurred during those long-drawn-out negotiations between Washington and London, in an attempt to reach a simple decision as to joint action.

As far back as September, 1917, the danger had been pointed out and the necessity for plans stressed. Ten months later, although plans had been proposed, when the danger was thought to be really imminent, the department acknowledged that it had no approved plans. and said that it depended upon the European forces, and upon the British Grand Fleet, to stand off the danger until they had time to act. Even after the department had been aroused to the necessity for a joint plan, and had put forward one which was not really a joint plan and was wholly inpracticable, it took nearly two solid months to solve a problem which was easily susceptible of solution in a few hours of personal conference.

In May, 1918, the headquarters Planning Section had, in collaboration with the British, prepared a definite plan. This was submitted to the department in June. About September 1, a month after the department had submitted its impracticable plan (which was never adopted, and which was not agreed to by either the British or the American Planning Sections in London) it insisted on its plan and directed that it be put into effect, notwithstanding the fact that the majority of shipping involved was not United States shipping, and that other forces than our own were required to put the plan into execution.

If the enemy had only known. All he need have done during those two months was to make a series of bluffs, involving little risk to himself, and we would have done the rest. Shipping would have been paralyzed.

Digitized by Google

In conclusion I wish to reiterate the salient point in this case I am presenting. It is not that Foreign Navy Departments had abler officers than ours, nor that the officers of my London staff were abler than their brother officers in Washington, but that our Navy Department violated sound military principles in attempting to run a joint campaign over a 3,000 mile cable. This, notwithstanding that the department had in London an organization established by the department for the express purpose of preparing joint plans and coordinating with the Allies, all of whom maintained similar organizations in London to facilitate unity of command.

I have necessarily condensed this case, as it would take days to cover all of the details connected with it.

I feel that I have presented enough to give a true picture to the committee, and thereby to establish in this case alone that portion of my letter under investigation.

DEPARTMENTAL PLANS.

Thus far in my testimony I have been considering only the recommendations made to the department, after consulting with the Allies, and the action, or lack of action, of the department upon those recommendations.

I now propose to take up for discussion certain plans proposed by the department at different stages of the war, to show how and why certain of these plans were impracticable of execution, and why I was compelled to recommend against their adoption.

In paragraph 69 of my letter of January 7, 1920, I stated as follows:

> 69. * * * The objection to radically new plans was that the situation was critical and their preparation would delay striking quickly with all available forces. This insistance assumed that the department, incompletely informed as it necessarily was, and without previous experience in the war, was more competent to decide upon practicable plans than their own representative in continuous conference with the leaders of the allied navies who had had nearly three years experience. * * *

The war, at the time of our entry into it, had been going on for nearly three years. The United States Navy had, during this time, few, if any, representatives abroad other than the regular naval attachés, whose facilities for collecting information are much restricted in war time. Consequently the Navy Department was not very much better informed than the general public of actual conditions in the belligerent countries, and had but little trustworthy information in such matters as submarine losses, shipping losses, anti-submarine measures that had been tried and found effective, or the reverse, or on the other matters concerning which complete knowledge was essential to the development of effective plans for combatting the submarine menace.

After my arrival in England, where I was given access to the facts, it was wholly impossible, with the meager staff at my disposal, to place the department at once in possession of all the information that I acquired or was in position to acquire.

I shall take up in succession each of the following plans proposed by the department:

1. A protected land through the danger zone.
2. Blocking German ports.
3. Mine barriers of net and mines of standard types.
4. Mine barrier of mines of new type.

Digitized by Google

PLAN FOR PROTECTED LAND.

On July 7 I received the following message from the Navy Department:

Received: July 7, 1917.
To: Alusna, London.
From: Secretary of the Navy.
For: Vice Admiral Sims, U. S. S. *Melville*.

Is it not practicable to thoroughly patrol a single lane through the danger zone, by having sufficient number of antisubmarine vessels constantly passing back and forth, thus guarding a constant stream of vessels through the lane. 22006.

I think it is unnecessary to comment on this message, other than by reading the reply sent on July 11, which was as follows:

Sent: July 11, 1917.
To: Secretary of the Navy.
Through: Admiralty.

No. 93. Your dispatch 22006 concerning patrolling a single lane through danger zone received through *Melville* July 10. The plan has been fully considered in the past by the British Admiralty, but not adopted for primary reason that the number of patrol craft available have been, and will continue to be, inadequate. Another vital objection is that no matter how much or how often the lane can be shifted, its western end would always be clearly defined. Submarines have operated to a maximum distance from Ireland of 400 miles, and sinkings are frequent up to 200 miles. Even if the submarine did not attempt to attack through the patrol lines themselves, it could always attack to the westward, and the patrol line would afford excellent information as to the proper areas for attack. As experience shows that a vessel, even when zig-zagging and accompanied by a single zig-zagging destroyer close ahead, is not always immune to attack, it is apparent that, unless such a proposed patrol line was very dense, the submarine could undoubtedly attack successfully at any point along it. As more than one lane would have to be established, and as at least one-third of all patrol craft would always be resting, refueling or repairing, it seems manifest that the number of ships required for such a plan would never be available.

SIMS.

That is still another of the very numerous recommendations that were made by the Navy Department which exhibited a hardly understandable ignorance of the very elements of the submarine campaign.

BLOCKING GERMAN PORTS.

The success of German submarines in the early stages of the war, before our entry into it, and the apparent inefficacy of the measures adopted to combat them, led many of our naval officers to the opinion that the one measure that would prove really effective would be that of preventing their exit from home ports, either by blocking the ports or by mining them in.

No less a person than the President himself gave voice to this idea in his well-known statement that the best way to fight hornets was to destroy their nest, not to chase them individually after they had left their nest. The strategical idea involved was unquestionably sound; it was so unquestionably sound that it should have been patent to all that there must have been compelling reasons, tactical or otherwise, that had prevented its adoption by the Allies long before our entry into the war.

I found gradually in the early months of my mission abroad that the department was insistent upon development of some such solar plexus blow which would immediately defeat the submarine. Personal letters from officers in the department indicated clearly to me that, in their failure to realize the desperately critical nature of the

Digitized by Google

situation, they were allowing themselves to be drawn into fascinating speculation, in the effort to devise some such new and radical offensive plan. In fact, this was clearly revealed to me, a few days after my arrival in London, when I received from the department the following dispatch, on the 17th of April:

Is it not practicable to blockade German coast efficiently and completely, thus making practically impossible the egress and ingress of submarines? The steps attempted or accomplished in this direction are to be reported at once. Yours of noon 14th April will be given earnest and immediate attention.

DANIELS,
Secretary of the Navy.

After consultation with the allied naval authorities, I replied to this cable in a dispatch of April 18, as follows:

To absolutely blockade the German and Belgian coast against the entrance and departure of submarines has been found quite unfeasible. Attempts have been made with all possible means to stop egress and to prevent nets and mines being dragged out. Many nets and mine fields have been, and continue to be, laid—destroyers, submarines, and other vessels have been used. Of course, for craft operating so near enemy bases, the danger is great and the result has been that several have been mined and torpedoed. Even to keep up an effective patrol against submarines and raiders between Norway and Scotland has been found quite unfeasible; far too many ships were attacked. On lines between Iceland and Scotland, and between Scotland and Greenland, ice floes as well as enemy craft must be guarded against on lines where patrol is now kept up. It is necessary to move these lines after each enemy contact, in order to maintain them and to prevent torpedoing, as there are no available ships to protect the cruisers from attack by submarines. The destroyer has shown itself to be to a great degree the most efficacious enemy of the submarines attacking commerce. All possible means are taken by the enemy to force their being assigned to other duty, even to sinking ships on hospital service. With the exception of the minimum number required by the Grand fleet, for carrying troops and their supplies, all destroyers are now so used. These vessels are being constructed as expeditiously as possible, but their number is quite insufficient to meet the existing submarine crisis, particularly as it affects merchantmen.

SIMS.

In my letter-report of April 19 I further discussed this problem, pointing out the impossibility of such operations as the one proposed by the department. The letter is as follows:

22. In the absence of adequate patrol craft, particularly destroyers, and until the enemy submarine morale is broken, there is but one sure method of meeting the submarine issue, upon which there is also complete unanimity—increased number of merchant bottoms, preferably small.

More ships! More ships! More ships! is heard on every hand.

23. It is also significant that, until very recently, the Admiralty have been unable to completely convince some members of the Cabinet that the submarine issue is the deciding factor in the war. The civilian mind, here as at home, is loath to believe in unseen dangers, particularly until the pinch is felt in real physical ways.

24. The prime minister only two days ago expressed to me the opinion that it ought to be possible to find physical means of absolutely sealing up all escape of submarines from their own ports. The fact that all such methods (nets, mines, obstructions, etc.) inherently involve the added necessity of continuous protection and maintenance by our own naval forces, is seldom understood and appreciated. I finally convinced the prime minister of the fallacy of such propositions by describing the situation into which we would be led, namely, that in order to maintain our obstructions we would have to match the forces the enemy brought against them, until finally the majority, if not all, of our forces would be forced into dangerous areas, where they would be subject to continual torpedo and other attack, in fact, in a position most favorable to the enemy.

25. Entirely outside of the fact that the enemy does, and always can, force exits, and thereby nullify the close blockade, the weather is a serious added difficulty. The heaviest anchors obtainable have been used for nets, mines, and obstructions, only to have the arduous work of weeks swept away in a few hours of heavy weather. Moorings will not hold. They chase through. In this respect we could be of great assistance, i. e. in supply of moorings and buoys.

Digitized by Google

26. The channel is not now, and never has been, completely sealed against submarine egress, let alone the vaster areas of escape to the north. Submarines have gone under mine fields, and have succeeded in unknown ways in evading and cutting through nets and obstructions.

That this idea of a close blockade of German ports was not entirely given up by the department, is evidenced by the fact that when Admiral Mayo came to Europe in September, 1917, this whole question of a close blockade was taken up by him with the allied authorities, at the request of the Navy Department.

It may be interesting to review, for a moment, what happened at that time, to show how impossible such a scheme was, and to illustrate how difficult it was to convince the department why a scheme apparently so simple had not long since been carried into effect; and that there was some other reason besides its mere impracticability which had prevented the Allies from carrying out such an operation. As I will point out in a moment, I had received repeated inquiries from the department, between April and August, concerning plans for future operations, desiring to know whether or not, and if not why not, the Allies were considering any new offensive operations. I had replied to these at the time, pointing out that full plans for offensive operations had been outlined in my messages to the department. The military issue at the time depended upon putting down the submarine menace, and it was, therefore, a military necessity that all plans for immediate operations should have as their mission the defeat of the submarine campaign, and the recommendations which had been sent to the department since April, 1917, had been plans proposed to meet this end.

When Admiral Mayo arrived in London in August, 1917, it was arranged that, in the naval conferences to be held in September, the first subject for discussion should be, at the request of the Navy Department, the "question of offensive operations against enemy fleets or bases," second, "manner in which United States Navy can best operate with Allies for successful prosecution of war," fifth, "offensive measures against enemy submarines."

In the first days of this session, plans for such a close offensive against German bases in the Heligoland Bight were discussed. Admiral Mayo, in his report to the Navy Department, reported on these. After an examination of such operations, he was convinced that they would be impossible, without the sacrifice of a very large naval force; and in his letter to the Secretary of the Navy, on September 8, he said that the only scheme which might be practicable would involve the sinking of 40 old battleships and 43 old cruisers, to be contributed pro rata by the allied powers, as merchant ships could not be spared for the purpose. The primary object of this scheme was that proposed in the department's cable of April 17, which I have read, that is, to block submarines in by blocking up the German exits to the North Sea. The old battleships and cruisers referred to above would have been filled with cement, and sunk in the entrance to German ports, in the same way as was later done at Zeebrugge and Ostend.

When the full details of the discussions at this conference were presented to the Navy Department, the magnitude and impracticability of such a scheme of close blockade was at last recognized, and in a cable of October 21, 1917—that is, seven months after the department had proposed the scheme, they cabled:

Digitized by Google

No. 775. Department considers close offensive involving sinking of older battleships and cruisers to block German channels impracticable.

I might add there that it was also the opinion of the conference that even if the channels should be successfully blocked, a channel could be dug around the blockading ships in a very short time.

Even in the case of similar operations, undertaken by the British against Ostend and Zeebrugge in the spring of 1918, it should be remembered that even the partial closing of these two ports, which was accomplished by that splendid naval feat, required intensive preparation which was going on for eight months before the operation was actually carried out. The gentlemen of the committee will, therefore, perhaps be able to imagine the length of time and the amount of material that would have been required to carry out a scheme such as that proposed by the department in April, 1917; but it is needless to discuss this further, for, as I have already read you, the department itself, after it had received Admiral Mayo's confirmation of my recommendations, announced that such a scheme was impracticable.

NET AND MINE BARRIERS.

The idea of blocking the German ports was only one phase of the idea which the department seems to have had in mind at this time, that is, in the early months of 1917, to do away with the submarine menace by some new and radical plan of offensive operations. Personal letters which I received from officers in the department at this time contained practically nothing else than long discussions of various projects which might be carried out to accomplish that end, all of these requiring a tremendous amount of material, and a length of time, which necessarily reduced them to subsidiary operations to be carried out when time and material might be available, if they were considered at all feasible, rather than as the main operation which the United States Navy should undertake.

Another proposal of this sort was made to me by the Navy Department on May 11, 1917. This was as follows:

[Cablegram.]

From: Secretary of the Navy.
To: Rear Admiral Sims.
Received May 11, 1917.

Much opinion here is in favor of concerted efforts by the Allies to establish a complete barrier across the North Sea, Norway, and Scotland, either direct, or via the Shetlands, to prevent the egress of German submarines. This plan would involve the use of various forms of mines, nets, patrols, and the release for this purpose of all ships upon American coast patrols, as well as many vessels of the Allies now employed elsewhere. The plan also involves regulations for the commerce of Holland and Scandinavian neutrals to pass barriers and defined control gates. It also includes closing Norway's territorial waters. The difficulty and size of the problem is recognized, but, if it is possible of accomplishment, the situation would warrant the effort. If this plan is not feasible, could not the same plan be carried out between Denmark and Norway, across the Skaggerack. Make full report.

One or two comments should be made before I read you my reply. It should be noted that the department specifically stated that this plan would involve the use of various forms of mines, nets, and patrols, and the diversion to this project of many vessels of the Allies now employed elsewhere. This feature at a time when, as I was informing the department several times weekly, the war might be lost in a few months, made the scheme quite impracticable, unless we could first

Digitized by Google

be assured of such a diminishing of tonnage losses that the war could be carried on to a successful conclusion, and that the material required for any such plan could be transported overseas.

I replied to this with my dispatch of May 14, 1917, which was as follows:

[Cable dispatch.]

Sent: May 14, 1917.
To: Secretary of the Navy.

Replying department's cable of May 11, concerning net and other barrages for preventing egress of enemy submarines. The general situation is as follows, based upon full conference with British Admiralty. According to their experience, all barrages, whether of mines, or nets, or both, are not an absolute solution, for the following fundamental reason: Nets do not stop submarines. Mine barriers can not be wholly effective, unless they could be maintained by patrol at all points. Few of the 30,000 laid in Heligoland Bight can be watched, but, even if all could be patrolled, it would not be wholly effective, because the necessarily locally weak dispersed line of patrols can be broken by enemy concentrated attacks at any point, and as often as may be necessary, and mines dragged out, thus releasing submarines. A barrage that can be thus broken at will, by concentrated attack, is ineffective. This subject was fully explained in my letter of May 11, now on the way. For special purposes of embarrassing enemy movements, unprotected barrages of mines have always been, and now are extensively used in certain areas. Bitter and extensive experience has forced the abandonment of any serious attempt at blockading such passages as Scotland to Norway, Scotland to Shetlands, Skaggerack. The one place that serous attempt at mine barrage is still attempted is the Heligoland Bight. Over 30,000 mines are now planted there, and mine losses there are replaced as fast as possible, about 3,000 a a month.

This of course does not, and probably never can, be absolutely effective, for reasons above given. Enemy submarines can always find passages around, and through, principally close in shore, and through island passages and gaps dragged in mine fields. The larger the number of mines, however, the greater degree of embarrassment to enemy. Hence the more mines we can send the better, and there is no limit to number that would be useful. Mined area much too extensive for all to be patrolled, hence no definite knowledge of number of submarines destroyed or damaged by mines. Speaking generally, the primary immediate necessity in numbers of patrol craft, and, as previously reported, too much stress can not be laid upon the urgency of reinforcing the Allied antisubmarine forces to the extreme possible limit. Defensive measures on our own coast, or in any other locality, and in fact, all defensive considerations, should be subordinated to the offensive against the submarines where they are operating. Even if enemy submarines appear on our own coast, their operations can never be of major importance, owing to the manifest limitations of distance from their bases, and endurance of personnel. In fact if some of the submarine efforts could be diverted into other areas than the focus of all lines of communications, the critical nature of the present situation would undoubtedly be diminished. It is the firm conviction of all British officials concerned in this problem that the most effective opposition to submarine lies in numbers of antisubmarine craft strategically disposed, with the mission of dispersing the enemy submarine efforts from the critical areas and thereby forcing them to operate over such widely separated areas that their successes and our losses will be reduced below the critical point. Every effort is being made to increase the British patrols. The measures we take must be carried out with utmost dispatch in view of the critical degree of enemy submarine success and the general Allied military and political situation.

The element of time is all important. The need is for destroyers antisubmarine craft tugs and mine layers in the greatest possible numbers. The British Government and Admiralty deeply appreciate the evidence of America's desire to assist in putting down submarine menace.

SIMS.

It should be noted at this point that the scheme here proposed, although similar in character, and designed to be carried out in the same area, as the northern mine barrage which will be discussed later, was in no sense the same plan later carried into effect in laying that barrage. The thing which made possible the northern barrage was the use of a certain type of mine known as the antenna mine,

Digitized by Google

because of its technical features which had not been invented at the time this dispatch was sent to the department.

For a month I had been cabling full details as to the situation, outlining the offensive plan against submarines, which involved the use of all available antisubmarine craft, and the adoption of the convoy system, in order to insure the protection of sufficient merchant tonnage to enable the war to be carried on. As I have already pointed out, I had received few replies to my recommendations from the department.

In my letter of May 11 to the department, dealing with this subject, I said:

15. Numerous propositions are made to the British Admiralty that have for their object the closing of the North Sea, or the German ports, against the ingress or egress of submarines. These are presented by all classes of people, including Members of Parliament.

They are, generally speaking, of two classes, namely, mines or nets, or both. I have gone over this whole matter with the first sea lord, and those members of the Admiralty board who are specially charged with the practical details of such matters.

16. As may well be imagined, this whole subject has been given the most earnest consideration, as it is of course realized that if submarines could be kept from coming out, the whole problem would at once be solved.

17. As a result of this consideration many schemes have been tried. The following is a brief summary of those tried and the difficulties encountered:

18. It has been found that no net will stop a submarine if it is securely anchored at each end. The submarines are fitted with net cutters on the bow and sides, housing periscopes, and strong steel guys from the bow to the tower.

19. But even those not so fitted can steam through a net, unless one end is held by a trawler, fitted with a winch for slacking off the anchor line.

20. Nets have been fitted with numerous small mines which will blow a hole through a submarine's side, but as soon as the nature and location of such nets were known, the submarine made a practice of approaching with the periscope out until the surface buoys were sighted, then rising to the surface, running over the buoys, and immediately diving again. An attempt is being made to so fit the buoys that contact with them will explode the mines immediately below.

21. There has been great difficulty in maintaining nets and mines in place. Gales frequently sweep out both, and the enemy mine sweepers are constantly at work destroying them.

22. In some places neither mines nor nets are effective on account of the strong tides. This is particularly the case between the Orkney and Shetland Islands.

23. Mines and nets are very extensively used in the attempt to prevent the ingress and egress of submarines from German ports, and to embarrass their movements, and also in attempting to prevent their passage through the Channel. I have been shown the working charts and have had the various efforts explained to me by Admiral Jellicoe.

24. Generally speaking, the area inclosed within a line running first north-northwest, then north, from Texal Island, thence in a curve to the eastward to a point north of Horn Reef, contains numerous lines and fields of mines. Within this area there are at least 30,000 mines, and additional ones are being laid at the rate of 3,000 a month. The field is now being extended to the westward and northward from Texal Island to Broken Bank. (See chart of the British Islands and North Sea.) Some submarines are known to have been destroyed in the Channel; but the difficulty of the problem will be recognized from the fact that the comparatively narrow Dover Strait is not now completely closed to the passage of submarines.

25. This latter illustrates the difficulty of closing such a wide gap as the northern entrance to the North Sea from Kinnard Head to Norway. On this line of about 230 miles there is 30 to over 100 fathoms of water. The number of patrol boats necessary to watch these nets would be very great.

26. As for protecting such a long line, or any line of considerable length, it is of course physically impossible to do so effectively, and this for the fundamental rason that the defense is stretched out in a long and locally weak line, while the enemy can concentrate an attack at any point of it, destroy the patrol vessel, and drag our some sections of the mines or net, thus permitting the passage of any number of submarines.

27. This can be done in as many places as desired and as often as may be necessary, whether the barrier is nets or mines, and it is because of this fundamental principle of a concentrated attack against a point of a necessarily dispersed force that no such

Digitized by Google

barrier can ever be sufficiently effective to prevent the passage of all the submarines the enemy wishes to send out.

28. This is the gist of the whole matter, the physical impossibility of a dispersed force successfully resisting a locally concentrated attack.

(*a*) Enemy cruiser of considerable gun power can make a hole in any patrol of a barrier.

(*b*) The patrol vessels must retire before such a force, thus permitting a section of mines or nets to be dragged out and thus defeating the object of the barrier.

(*c*) It has, of course, been proposed to guard a barrier with heavy vessels. This is what Germany hopes Great Britain will do, thus exposing them to torpedo attack and permitting their policy of attrition to be carried out. The British vessels would also be exposed to similar attack, but the British can not successfully compete with Germany in torpedo warfare, particularly near the bases of the latter.

I can not too strongly emphasize the fact that during nearly three years of actual warfare this whole question has been the most serious subject of consideration by the British Admiralty, and that many schemes of the nature of those in question have been thoroughly discussed and those considered practicable—those which do not violate a fundamental principle—have been or are now being tried and extended; but the point is that no barrier can be completely effective, and, unfortunately, a barrier or system of barriers such as mines, etc., needs only to be slightly ineffective to permit continuous passage without much loss of submarines.

29. It is in view of the above and of the large amount of supporting evidence obtained that I have so urgently recommended that our primary military effort should be concentrated in getting the maximum number of antisubmarine craft of all descriptions into the enemy's main area of activity.

Nets, barriers, and similar methods can never be entirely effective but only palliative. The submarines must always be opposed in its field of action, and the most effective opposition discovered to date is numbers of antisubmarine craft.

The difficulty at present is the lack of such craft.

THE NORTHERN BARRAGE.

I have already pointed out, in the discussion of the plans for net and mine barriers, that the barrage proposed by the department in may, 1917, involved the use of various kinds of mines, nets, and patrols in quantities which rendered any such plan impracticable of execution. With the invention in the United States of a new type of mine, however, the project was put in an entirely new light and it merited further careful consideration. The Bureau of Ordnance of our Navy Department was quick to grasp the possibilities offered by the new mine and to outline a plan for its use.

From the time of my first arrival in Great Britain I had taken up the question of the improvement and development of our mines. In spite of all the other demands upon my time, the failure of the department to provide me a staff and the difficulties which I had in obtaining information myself, I yet considered this subject sufficiently important to make a special effort to keep the department informed of allied experience.

Thus, in a cable of April 16, I informed the department:

Sent: April 16, 1917.
To: Navintel. No.20017.

Admiralty reports Vickers Elia mine as originally designed very unsatisfactory, and that necessary service improvements, since war began, are essential to efficiency. Particular trouble with depth taking and pistol. Distance weight now not released until mine and anchor sink about 10 feet. New design pawl on mooring line reel,

Digitized by Google

and elimination shearing pins and modification firing pin sleeve release. All are Admiralty improvements and war secrets. Am sending drawings next dispatch bag, and British expert mine officer, as soon as possible. Admiralty now building German mine similar Carbonnit, with changes (see Babcock intelligence reports, 1912 and 1913). Please send me latest torpedo war nose and anticircular run device, both drawing and sample. Advise sending McBride, also engineer and gunnery officer. All information now wide open.

SIMS.

I arranged as soon as possible with the Admiralty to have a mining expert sent to the department, with samples and designs of all British mines, and at the end of April such an expert was sent to the department, with plans and samples of all British improvements.

In my letter of April 27, I referred to certain of the British experiences during the war, with regard to the use of mines and reported that they were abandoning the type of mine that had been in use, in favor of one similar to the German type. In view of the fact that the British had found the type of mine, which they had been using previous to the war, sufficiently unsuitable for war purposes to induce them to change their own mining designs, it soon became apparent that our own existing types of mines, which were identical with the British mine were also antiquidated and unsuitable for the type of work required and would not be of any material assistance. This I pointed out to the department in a cable of May 31, 1917. [Reading:]

Sent: May 31, 1917.
To: Secretary of Navy, Operations.
Through: State Department.

With reference my previous dispatches concerning our supplying mines, the British Admiralty have concentrated on mine construction to such an extent that they now expect the output by August, will reach 10,000 a month. Their maximum facilities for laying mines are about 7,000 a month. From their previous experience with mines, similar to those which we now have on hand, they consider it unwise to attempt to utilize our present available supply. In view of above, and as our output of a different type of mine would not be available in sufficient time, they now consider we can more profitably concentrate on other work.

SIMS.

It is, of course, unnecessary to emphasize the fact that the mine that I was referring to here was our supply of prewar designs, which the war had shown to be ineffective and not the mine which we finally used and which at that time had not been perfected, or even, to my knowledge, invented.

On June 23, 1917, I received another cable from the department with regard to mines. This was as follows:

Received: June 23, 1917.
To: Alusna, London.
For: Vice Admiral Sims. No. 31.

The Bureau of Ordnance is now in a position to manufacture latest type of Admiralty mine, or a superior type, at the rate of 4,000 per week beginning 60 days from now. It is the opinion of the Admiralty that possible future improvements make it desirable that we construct a surplus supply, for possible use in European waters; if so, how many do they suggest we ought to manufacture? Would the Admiralty like to have us manufacture nets for use over there? If so, send details at once. Has a mine, not effective against surface craft, but effective against submarines ever been under consideration? Are there any plans of future contemplated operations that we could be supplied with. 16022.

DANIELS.

A point, which I should like to stress, is well illustrated by this message. I still had but one aide, and yet the department asked me to find out the Admiralty opinion as to possible use of various

Digitized by Google

types of mines, how many they should supply, whether the department should manufacture nets, and, if so, I was to send all details. I was to find out all about mine developments among the Allies. It should be pointed out that at the time I received this message, I was at Queenstown, in command of the Irish station. Nobody on my staff was in London, with the exception of one man who had resigned from the Navy in 1914, and had been assisting me voluntarily without pay since April, 1917. During this same week I received requests from the department for recommendations as to the type of destroyers that should be built, as to the allied aircraft plans, and as to what the effort of the United States in naval aviation, and cooperation with the Allies, should be. It was therefore, quite impossible for me to reply immediately, as the number of hours in a day is fixed, and the physical endurance of men is limited, and of this I informed the department at the time.

On July 7 I replied with the following message:

Sent: July 7, 1917.
To: Secretary of the Navy.
Through: Admiralty, via naval attaché, Washington.

No. 84. Replying your No. 31, all assistance which Bureau of Ordnance can render in manufacture of efficient type of mines and depth charges will be invaluable. British output at present in excess of available ships to handle, but numbers ships being increased. Can we furnish mine layers as well as mines. Admiralty experience now indicates necessity for abandoning entirely the Elia lever type, in favor of the German horn type, with horns on bottom as well as top. Also necessity for increased buoyancy to oppose tieds. Latest type will have 500-pound buoyancy, and 1,300-pound anchors. For mining against submarines, they are now using fixed instead of automatic depth anchors, as one floating mine or mine near surface discloses an entire field. Many designs of mines effective against submarines, but ineffective against surface craft, have been considered, but no satisfactory type developed to date. Admiralty would appreciate information if such a mine has been developed. Drawings of latest British mine of horn type forwarded June 28. Nets, moorings, and wire gear generally are available, to the extent to which they can be used, and it is urgently necessary to reduce demands on shipping. Brazil is asking England for nets. Can we meet her demands. Delay in answering this cable due to impossibility of keeping up the work here with present staff.

In my letter of July 14 I plainly state my attitude with regard to the whole question of the use of mines. The following are extracts from this letter:

[Letter No. 29, July 14, 1917.]

7. *Mines.*—There seems to have been a misunderstanding, probably owing to the inadequacy of cable communication, concerning our cooperation as regards mines. The responsibility concerning such a misunderstanding, if it has occurred, should be mine, as it was probably due to lack of time on my part to follow all of the subjects which affect the cause and to clearly set them before the department.

There is, of course, an urgent need for mines and, as I originally stated in a cable, too many could hardly be available.

Up to the present, however, the British output of mines has been equal to or in excess of their facilities for laying them.

An attempt is now being made to impress certain auxiliary vessels into service for this duty.

Great difficulty has also been experienced, due to the stress of other important war requirements, to obtain a mine of satisfactory design to meet the unusual conditions which have developed.

Serious troubles developed from the beginning with the Vickers Elia type, and, as all British mine manufacturing facilities were equipped to build the Elia mine, it was very difficult to alter the design, as experience from time to time indicated to be necessary and to change the methods of manufacture which were thereby imposed.

8. It has now been decided to abandon this type of mine entirely in favor of a mine of the type used by the enemy, modified in accordance with British experience.

In fact, the drawings of this type of mine which are now in the department do not cover the latest developments, which have occurred since they were prepared.

Digitized by Google

The mine question is a very serious one, and our cooperation can only be efficiently directed by having an expert representative of the Bureau of Ordnance here at all times.

9. At the present moment the enemy is making determined efforts to sweep numerous channels through the mine fields in Helgoland Bight. The extent of the mine fields renders offensive operations against the enemy mine sweepers very difficult, particularly as they are aided by Zeppelin scouts.

In addition, mining activities are going on in other areas, particularly the Belgian coast at the western end of the allied lines.

Recent evidence has indicated preparations on the part of the enemy to attempt a landing to the south of the allied lines, apparently with a view to outflanking, and as a result new mine fields are being laid by the British in that area.

Early in August, 1917, I received a number of letters from the Bureau of Ordnance referring to their plans for the production of mines and offering to provide the Admiralty with a supply of mines and depth charges.

In reply to these letters, I cabled on August 13, 1917, the following message:

To: Secretary of the Navy, Washington.

No. 246. Admiralty very appreciative of department's willingness to undertake suggested program for manufacture mines and depth charges, and much impressed with magnitude of program. At present no United States representative here familiar with bureau plans, and no British representative in Washington competent to represent Admiralty. Since program involves personnel and ships of both services, also in view Admiralty's extensive war experience in these lines, recommend at earliest date, before undertaking manufacture in quantity, bureau send competent representative here with Admiral Mayo temporarily, for conference. Should bring fullest data and samples if available.

In my letter report of the same date, August 13, 1917, I made clear the confusion which was existing with regard to the subject of mines, pointing out that this confusion and the misunderstanding which had arisen on both sides were undoubtedly due to the lack of that coordination of effort which I had been recommending for four months—since April—and again urging that representatives of the Bureau of Ordnance be sent to London. I had made this recommendation first on the 16th of April. I had repeated it continually throughout May, June, and July; and at this date was still without any technical assistants familiar with the plans of the Navy Department with regard to this very important question of mine development. My letter of August 13 was as follows:

It is considered very important that closer cooperation should be established between the Bureau of Ordnance and the Admiralty concerning the general subject of mines and depth charges, their design, manufacture, and supply.

It is apparent that considerable confusion has occurred to date on this subject, owing to the various means of communication which have been used and, primarily, with the difficulty of insuring clear understanding with long-distance communications by letter and cable. For example, it is found that communications have been exchanged via this office, via the naval attaché's office, London, and office of Naval Intelligence, and also by direct cablegrams between the Admiralty to their naval attaché in Washington. Owing to the stress of duties in all the above forces, considerable misunderstanding has evidently developed.

The Admiralty are very appreciative of the efforts being put forward by our Bureau of Ordnance in connection with the mines and depth charges and fully realize the great assistance which the Navy Department is in a position to render to the common cause in this direction. They have at no time wished to convey the idea that they were reluctant to accept assistance, or that they were not perfectly willing to accept new designs developed in the Bureau of Ordnance. Their experience in developing new designs and arranging and conducting manufacture rapidly under pressure of actual war conditions has been very disheartening, and they are therefore considerably concerned over the prospect of our introducing new designs with which the personnel here will not be wholly familiar.

Digitized by Google

I might say in that connection that all the Allies discovered that not only mines, but a good deal more of their war material which had stood the ordinary tests in time of peace, failed to stand the tests in time of war. Mines that had been developed in time of peace and were tested by putting perhaps a couple of dozen on a ship, the people interested in the mines having seen that they were all in apple-pie order and having succeeded in laying those mines at proper depths, and when they began to lay them in numbers of 300 or 400 from one ship going at a certain speed and then made an examination of the field, they found that it was not effective. [Continuing reading:]

So many designs have been developed during the war which appeared entirely satisfactory in the drafting room, and even after service test, but which developed serious troubles and difficulties when the finished weapon was used afloat, that it is natural that every effort should be put forward now to adhere to any design which has proven itself satisfactory afloat, in order that manufacturing can be facilitated, the maximum efficiency of the personnel afloat obtained, and the success of future operations thereby better assured. Some of the various considerations which complicate the general mining problem are facilities of depots, provision and supply of spare parts, facilities and fittings of mine layers and mine transports, allocating the various types, keeping track of their issue and consumption, training of personnel, and many other questions. The Admiralty state that their representative should in no case be considered as a representative of the mining department of the Admiralty; his experience has been primarily connected with the Vickers Elia type of mines, which is now definitely abandoned. The Admiralty state that there is at present no one British officer in the United States sufficiently familiar with British designs and British experience to be in a position to properly represent the Admiralty.

The assistance of the Navy Department in this field is of such importance, and the subject is so complicated, that I strongly advise sending a thoroughly competent representative of the Bureau of Ordnance to London at the earliest possible moment for temporary duty, with the sole object of consulting with the Admiralty mine officials, obtaining general information of the mining situation, and then returning immediately to the bureau. Such a representative should bring with him all drawings and specifications, and if possible sample mechanism, and in case of new developments such sketches or other information as is available.

It is urgently requested that all information, including drawings or even sketches of bureau designs, be forwarded as fast as they are developed, in order that the war experience of the Admiralty may be placed at the bureau's disposal before manufacturing is undertaken to any considerable extent.

The first intimation that I had from the department of the discovery or invention of any new type of mine, such as would make possible extensive operations when material and tonnage became available, was in a message received from the department on the 18th of August, over three months after the department had proposed their first scheme for a barrier across the North Sea. The message was as follows:

[Cablegram, Aug. 18, 1917.]

From: Admiral Benson.
To: Admiral Sims.

Opnav 187. Bureau of Ordnance has developed mine which is hoped may have decisive influence upon operations against submarine. Utmost secrecy considered necessary. Request that officer representing Admiralty, clothed with power to decide, be sent here to inspect and thoroughly test mine. If found satisfactory arrange for cooperation in mine operation. 20017.

I immediately replied in my dispatch 187 of August 22, stating that the British were sending a special officer to inspect and test the new mine, and that if it was found "suitable for operations in contemplation further arrangements for cooperation would be made."

It was at this time—that is, just after the middle of August—that Admiral Mayo arrived in London. He brought with him a memo-

Digitized by Google

randum from the Bureau of Ordnance with regard to the new mine and had been instructed by the department to discuss at the allied conference the possibility of offensive operations based upon the employment of this new mine.

In the agenda for the conference prepared by Admiral Jellico, item 2 was that of a mine or net barrage, either in German waters or further afield. In his report of the conference, addressed to the Secretary of the Navy on September 8, Admiral Mayo said regarding the discussion that took place:

The British Admiralty put forward as an alternative to a close offensive in German waters the suggestion that the activity of enemy submarines might be restricted by the laying of an effective mine field or mine net barrage. If such an operation were undertaken, it would appear that it would take the form of:

1. An efficient mine-field barrage, so as to completely shut in the North Sea, which was estimated to require about 100,000 mines, a number of which would not be available for some considerable time; or

2. A barrage of mine nets for the same purpose, which proposal was, in view of experience to date, deemed impracticable. The conference after discussion agreed that the distinct mine barrage could not well be undertaken until an adequate supply of mines of satisfactory type was assured and that until or unless such conditions ensue the improvements and extension of the present system of mine fields was desirable, and further, that a barrage of mine nets was impracticable.

This was Admiral Mayo's report.

The same information was cabled to the department by Admiral Mayo in cables of September 5 and September 6, 1917.

It is apparent from the results of this conference that once again the impracticability was clearly shown of any such scheme as that proposed by the department in its cable of May 11, which was based upon the assumption that a barrier of mine nets could be planted and maintained.

The description of the new mine brought over by Admiral Mayo gave an entirely new direction to the discussion, and before Admiral Mayo left he was provided with a plan drawn up in a conference of allied officers for a barrage of mines of this new type to be put across the North Sea.

On September 13 Admiral Mayo received a message from Admiral Benson emphasizing the great possibilities of the new mine, stating the British officers sent over to the United States to examine it had found it most satisfactory and urging that immediate action be taken. The result was a proposal by the Admiralty of a definite scheme for the northern mine barrage.

On October 21, after Admiral Mayo had returned to Washington and conferred with the department, the department cabled me in their No. 772 as follows:

Sixth. Contract has been let for 100,000 mines of American type. The United States has offered to commandeer for British Admiralty three vessels suitable for mine laying, and in addition can probably commandeer two or three more vessels suitable for mine laying, to be manned by United States for employment in cooperation with British mine-laying force, in joint plan which may be finally agreed upon.

Seventh. Question of proposed mine barrage, Scotland to Norway, as presented to Navy Department is not definitely concurred in, but careful consideration is being given to this particular subject with a view to arrive at definite conclusion in regard to employment of the mine barrage, which measure is considered in principle to promise good results.

That is to say, the mine barrage of the North Sea, the plan of which was drawn up by the British Admiralty and which had been proposed by the British Admiralty and which was taken home by

Digitized by Google

Admiral Mayo, was held up for discussion to see whether the American Navy Department would agree to the laying of that barrage.

After a further consideration of the plans, the department decided to accept the Admiralty's proposal for a joint mine barrage in the North Sea, and in a cable of November 2, 1917, I was informed of the acceptance of the project by the department in the following cable:

Inform Admiralty that department concurs in project for mine barriers, Scotland to Norway, and has already taken steps to fit out eight mine planters, to sail February 1; also expediting completion 12 mine-sweeping tugs. Expect begin shipment of mines January 15. Will send officers to confer and arrange details within a few days.

By this time losses of merchant tonnage through submarine action had diminished to one-half the April, 1917, figure, and this, combined with the increasing number of antisubmarine craft, the rising curve of merchant tonnage production, and the extended employment of the convoy system, had made it apparent that the Allies would be able ultimately to defeat the submarine, and to carry on the war throughout 1918, provided no increase in tonnage losses was experienced.

This situation, and this situation alone, made it possible to divert a portion of our military and industrial efforts from those antisubmarine measures which were producing immediate results to others, such as the proposed mine barrage, from which it would take longer to realize benefit. Our primary mission continued of course to be the protection of troops and shipping in convoys; but any undertaking which we could carry out in addition, such as the northern mine barrage, gave promise of being of great value in helping to defeat the submarines, and in depressing the morale of submarine commanders.

As I have clearly pointed out, however, the plan of the mine barrage, as finally carried out, as a supplementary measure against submarines, was an entirely different matter from the plans proposed by the department in April and May, 1917. These implied a complete neglect of the time element, and a desire to undertake enormous projects which could not possibly have been carried out at the time, and in time to be of any avail against the submarine campaign, unless, in the meantime, the measures which had been recommended to the department, after full conference with the Allies, had been accepted and put into full effect. Considering the resources of the Allies at that time, this was a condition impossible to fulfill.

Here, again, is an illustration of the way in which, to quote from my letter of January 7, 1920, paragraph 78:

Instead of relying upon the judgment of those who had actual war experience in this peculiar warfare, the Navy Department, though lacking not only this experience, but also lacking adequate information concerning it, insisted upon a number of plans that could not be carried out.

I wish also to point out again that I am not asking this committee to believe that the plans of the department, cabled to me in April and May, 1917, were impracticable because I said so at the time, and say so now, but because the department definitely stated later, as I have read to you, that upon receiving fuller information, they regarded their plans as impracticable or impossible of execution; and during this time, before the department could be convinced that any such royal road to victory was impracticable, they were delaying action on recommendations made by their representative abroad,

Digitized by Google

after full consultation with the Allies, and thereby postponing by just so much the ultimate victory of the Allies.

To indicate to you further how impossible it would have been to undertake any such scheme as the northern barrage until it could be certain that the submarine activity could be checked, and time could be given to the development of other schemes like the mine barrage, let me review for a moment what had to be accomplished in developing the new mine, and preparing for the laying of the barrage, before it could even begin to be effective. The following problems had to be solved before this barrage could be put in effect:

1. The successful testing of the new mine at sea in the depths of water in which it was to be placed.

2. The placing of the production on an adequate basis to insure having a hundred thousand mines in time.

3. The commandeering of vessels and refitting them as mine layers.

4. The determination of the feasibility of fitting elevators on layers to reduce the number required and thereby the amount of time necessary.

5. The determination of the durability of the antennae of the mine in rough sea.

6. The determination of how successfully the normal electrical firing device would operate under actual conditions in the North Sea.

7. The problem of quantity production of the mine existing because of the necessity for assembling parts manufactured in many factories throughout the country.

8. The commandeering of 24 mine cargo ships to carry mines across the Atlantic at a time when all shipping was badly needed.

9. The necessity of establishing bases in Scotland for assembling the mines and loading them into the mine layers.

That question of bases alone, I may say incidentally, was a very, very large one; a tremendous installation with—I have forgotten how many—probably 3,000 men in all.

10. The necessity of arranging for adequate screening and protecting forces from the grand fleet for laying operations.

11. The planning of means of preventing sweeping operations by the enemy in a barrier 230 miles in length.

12. The solving of the problem of how Norwegian territorial waters could be closed.

13. The difficulty of cooperating with the grand fleet and of securing the consent of the commander of the fleet to laying mine fields with an untried electrical device in areas through which and over which the grand fleet necessarily might operate.

I might say in that connection that the mine barrier of nearly 100,000 mines got to the east of the anchorage of the grand fleet, and with the experience of all the Allies that many thousands of mines came adrift and drifted in shore, Admiral Beatty asked me what assurance I could give him that if our mines did drift—and a very considerable number of them did, drift—that they would become inoperative as soon as they got adrift; and it was only after we were able to satisfy him that there were three, and perhaps four—I can not remember exactly—separate devices in each mine which operated to make it ineffective after it became adrift, that he was satisfied that that mine barrage ought to be laid.

Digitized by Google

14. The problem of insuring the absolute secrecy upon which the success of the operation depended.

15. The problem of getting the adequate number of mines transported abroad, assembled, and laid, within a time which was practicable.

With the exception of the first, fifth, sixth, and fourteenth, all of these problems would have been presented in case a barrier of nets and ordinary horn mines had been undertaken, and such a barrier would have presented these further problems:

1. The production of about three times as many mines and with a corresponding increase in the times required for production and laying and in the tonnage required for their transportation.

The mine barrages as finally laid took about 100,000 mines. Without going into any details, I will say that was rendered possible by the antennæ and afloat projecting above the mine, which was so designed that contact with any part of the mine or float would set the mine off. This enabled a barrage to be established with about 100,000 mines. Before the invention of that antennæ type, it would have required about from three to four times as many mines; that is to say, from 300,000 to 400,000, to make a barrier extending down to 250 feet.

2. The establishment of a base on the coast of Norway as a haven for small patrol vessels or the employment on the patrol of large vessels able to remain at sea a long time and in all weathers.

It is apparent that, until solutions of all these problems had been assured, the barrage could not be definitely decided upon, and the actual laying of mines could not be begun until the problems had been actually solved.

As soon as the project was decided upon, its execution became one of the activities of the United States naval forces in European waters under my command. It therefore was incumbent upon me to assure myself that before giving my concurrence, not only that it was a practicable project but that it promised to be reasonably effective and could be executed without serious detriment to the efficiency of the other antisubmarine measures which were already being carried out.

The whole project was executed in a manner which reflects credit on all concerned in it; the bureaus of the Navy Department that produced the mines and mining material and that fitted out the mine-laying vessels—the most suitable and efficient employed by any of the allied navies—the officers who trained the personnel in mine laying and who controlled the actual operations; the officers who established and equipped the bases in Scotland; the officer who commanded the whole force engaged and was, in the first instance, responsible for the success of the whole operation; and the personnel, officers and men who worked out the project to a successful conclusion.

From the time at which the project was undertaken, it had my full support and approval as a subsidiary measure, designed to depress enemy morale, and to accomplish the destruction of a certain number of enemy submarines.

It would, perhaps, be unnecessary for me to make this statement but for the assertion which has been made and widely circulated that the Navy Department had proposed and had from the first favored

Digitized by Google

this project and that I was about the only officer of the Navy who had ever opposed it.

That statement was made before a large assembly in New York, in a very responsible manner, before an audience which was composed largely of our friends, the Irish, and my name was cordially hissed. I have gone into this subject here at some length to show that the statement there made was wholly false.

It should be fully understood, as I will explain in detail in a moment, that I never opposed the Northern Mine Barrage, as a valuable supplementary antisubmarine measure, when once the material and tonnage were available to make such a barrage possible. There is a distinction with regard to the mine barrage which has been lost sight of. As an achievement it stands as one of the wonders of this war. No such project in naval warfare had ever before been carried out more successfully. It is entirely beyond my power to give adequate expression to the admiration which I have for the organization in the United States which produced the mines, mine layers, and mining material and sent them abroad, and for the brave and efficient officers and sailors who were instrumental in the laying of this barrage; but, as a matter of policy, there is a very great difference between a mine barrage carried out as a useful supplementary measure and the proposal to make such a barrage our principal activity, when, in view of the fact that a year's preparation was necessary before so gigantic a project could be carried into effect. The war would have been lost before we could have assembled the material for such a barrage or could have found the tonnage to carry this material to Europe.

As I have repeatedly pointed out, the time element is one of the deciding factors in warfare. At a time of great danger, such as existed in 1917, at the time of our entry into the war, any plan, however successful in its ultimate results might be, must be judged in the light of the situation existing at the time. It is not enough when a nation is at war to prepare magnificent schemes of operation to be effective at some future date. When the enemy was striking the Allies in 1917, and dealing blows that were rapidly cutting all lines of communication by destroying the tonnage upon which the allied cause depended, no plan which we could have adopted would have been of any use which did not provide the immediate necessary assistance to the Allies in meeting the immediate issue; that is, the submarine campaign as it was being waged in 1917.

This is a point so simple that it needs only to be stated for its truth to be clear. Numerous illustrations can be drawn from the history of warfare to show how disastrous have been the consequences of failing to enter immediately into a war and meet a situation created by the enemy's activities in the hope that later a royal road to victory could be found. The idea of making a grand stroke which would at one fell swoop reduce the enemy to confusion and force him to surrender, has been throughout history one of those fascinating and delusive fallacies which have cost many a defeat.

As I am about to begin a new subject, and I understand the chairman wanted to stop a little early to-day, I might stop here.

The CHAIRMAN. Very well. The committee will stand adjourned until to-morrow morning.

(Thereupon, at 11.50 o'clock a. m., the subcommittee adjourned until to-morrow, Wednesday, March 17, 1920, at 10 o'clock a. m.)

Digitized by Google

NAVAL INVESTIGATION.

WEDNESDAY, MARCH 17, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, and Pittman.

TESTIMONY OF ADMIRAL WILLIAM S. SIMS—Resumed.

Admiral SIMS. Before proceeding with the testimony to-day, I should like to state that I have had printed each day the testimony I have given before this committee, and I have in addition to giving copies to the press, given copies of each day's hearing to all officers and others in the Navy Department who wished them, so that they would have a complete record of all the documentary evidence and comments, and would thus be able to bring out all the facts in the case.

I should also like to say that if any errors have been made in the copies of the letters and cablegrams that have been submitted, I should be very glad to have them corrected by a comparison with the official record. There may be some mistakes of a typographical nature.

I finished yesterday the consideration of the question of the North Sea barrage. In that statement I tried to make it entirely clear that I never had, at any time, opposed the barrage as now understood by this committee, and probably by the American people. It was only the impracticable barrage that was proposed in the first place.

DEPARTMENT'S REQUESTS FOR PLANS.

Throughout the months of June, July, and August, 1917, I continued to receive, from the department, cables in which they indicated their desire for some new and radical policy, thus showing that the department could not have realized, at the time, the dangerous character of the submarine warfare, and did not appreciate the extreme importance of the element of time.

Thus in a cable of June 23, 1917, with regard to the production of mines, the department cabled:

Are there any plans for future contemplated operations that we could be supplied with?

And this was on June 23, 1917. For over two months I had been urging upon the department the plans for future operations which

Digitized by Google

had been agreed upon by the heads of the allied navies as those required to meet the situation. This I continued to point out in other cables sent to the department.

In another cable of July 5, 1917, which I have already quoted in connection with the disposition of forces, the department stated:

So far no information as to any definite plans for future operations of naval forces. In view of requests made, and our efforts to respond, must insist that any plans for operations under consideration be submitted for our study.

Similarly, in its cable of July 10, 1917, with regard to the policy of the Navy Department, it was stated:

The department can not too strongly insist that, in its opinion, the offensive must always be the dominant note in any general plans of strategy prepared, but as the primary rôle in all offensive preparations must perforce belong to the allied powers, the Navy Department announces as its policy that, in general, it is willing to accept any joint plan of action of the Allies deemed necessary to meet immediate needs. * * * The Navy Department announces as its general plan of action the following * * *. 3. Its willingness to discuss more fully plans for joint operations.

JOSEPHUS DANIELS.

It is apparent from these dispatches, first, that the Navy Department still believed that it was being kept in ignorance with regard to essential plans; second, that its estimate of the situation in the war zone was completely mistaken, as is clearly indicated by its refusal to recognize the plans for antisubmarine operations, and for the convoy system as plans of operation against the enemy; and, third, that it still had in mind the royal road to victory.

As I pointed out in paragraph 20 of my letter of January 7, 1920:

Judging from the actions that were finally taken, after extensive cabled and written communications, and consequent long delays, it is apparent that, if I could have appeared daily in Washington to explain fully my recommendations, and the discussions before the conferences upon which they were based, they would undoubtedly have been carried out from two to six months earlier.

In paragraphs 28, 29, and 30 of this letter, I referred to these requests of the department for information concerning future offensive operations, and pointed out:

In other words, while the department's first statement of policy was what I had recommended since the beginning, it, nevertheless, withheld putting it into effect, apparently because of the conviction that the Allies were not keeping it fully informed of their plans. The truth of the matter was that nothing was withheld, and that all policies and plans which were in writing, which were actually of an official nature, and which in any way affected United States naval cooperation, had been transmitted to the department as completely as long distance communication—coded messages—permitted.

The review that I have thus far made of the attempts of the department to propose plans, and make decisions in Washington, has been, I think, a sufficient one to show you that, in the cases I have mentioned, the department itself recognized in the end the impracticability of the plans they had themselves earlier proposed. As a corollary to this, in the case of all the essential recommendations made in consultation with the Allies, the best proof of their soundness is the fact that the department later admitted their soundness by adopting them and by carrying them out as the policy of the department throughout the rest of the war. Consequently, there can now be no fundamental disagreement between myself and the department as to the policy and plans which were finally followed.

Digitized by Google

We are agreed that that policy was sound when it was adopted and put into effect. We are agreed also that the Navy in the war zone maintained its highest traditions, by the efficiency and devotion with which the personnel carried out their mission, and made the sea safe for our American troops and reasonably safe for all allied shipping, in spite of every effort of the German submarine.

But the point which I again stress, and can not stress too much, is that, for the first six months of the war, the department failed to realize, as it did later, the soundness of the recommendations which were being made in accordance with the department's instructions, and insisted upon proposing alternative schemes of its own, which the department itself, six months later, recognized were impracticable or unfeasible. This delay was tremendously costly, resulting in unnecessary loss of shipping and therefore the unnecessary prolongation of the war, with all its sacrifices.

INADEQUATE PERSONNEL FOR STAFF.

I come now to a question which I have touched on frequently in my testimony; that is, to the point No. 6, of paragraph 78, of my letter of January 7, 1920, in which I said:

> The department's representative with the allied admiralties was not supported during the most critical months of the war, either by the adequate personnel, or by the adequate forces, that could have been supplied.

In my letter, paragraphs 27, 46, 47, 48, 49, 50, 51, 52, 53, 54, 57, 58, I referred to the immense difficulty that I had in handling the tremendous amount of detailed work, and in discharging the very grave responsibilities which the department had intrusted to me, without giving me the assistance of an adequate staff of trained officers, who could have assisted me from the beginning to make my headquarters serve the department to the maximum extent, enabling it to maintain constant and intimate relations with the various branches of the allied admiralties, and with all the multifarious activities of the various branches of the allied admiralties, and with all the multifarious activities of the various allied fleets, throughout the areas in which they were engaged. In order to handle the situation, as I pointed out in paragraph 50 of my letter:

> I should have had a staff capable of:
> 1. Obtaining complete information of the various phases of the naval campaign, which had been in operation for over two years.
> 2. Keeping up to date with the developments which were rapidly changing almost from day to day.
> 3. Efficiently administering, supplying, and operating the entire force.
> 4. Coordinating our work with that of the Allies.

All the testimony that I have thus far offered will, doubtless, have served to convince you of the wide variety of subjects, and of the grave responsibility of the decisions, which the responsibilities of my position made necessary. It will only be necessary to review the letters and cables that I sent to the department on this subject, beginning in April, 1917, and continuing throughout the ensuing year, to show you what difficulties I had to meet, because of the lack of an adequate and properly equipped staff—a staff similar to that with which any business organization would have been provided.

Digitized by Google

Before proceeding with the testimony to substantiate this part of my letter, I wish clearly to define, beyond possibility of misunderstanding, the sole point at issue. That point, simply stated, is this: That during the critical period of the war, the first half of the war, the department left its representative abroad with wholly inadequate assistance to carry out the mission which they had assigned to him. As I stated in my letter of January 7, the necessity for such assistance was finally recognized by the department, and in the latter months of the war I was provided with an adequate staff. I hope I have made this sufficiently clear, and that we will not be led away from that point, namely, that the period in question is the critical first half and not the last half of the war.

It should also be pointed out that one of the chief reasons for the assignment of an adequate number of officers for duty abroad was, not only to assist me in carrying out my duties, but also to assist the department by making it possible to supply full reports upon every aspect of the naval activity in the war zone. One of the great dangers in the military service is apt to be the instinct of overconservatism, which clings to old teachings and traditions, without realizing to the full the changes brought in the crucial test of actual warfare, especially when, as in our case, we had been mere spectators for three years without receiving any very full or complete accounts of the developments and war experience of the allied powers. The very fact that we did not realize how many things we had to learn was, from the first, one of the grave dangers in making decisions and drawing up plans in Washington, and it was for this reason that I insistently urged that the department should send over officers in whom it had confidence, representing each of the technical bureaus, whose only function should be to acquire from the various allied services every available kind of information which would be of help to our own department, or, to put the case quite simply, that we might profit by the success and mistakes of our allies.

From the first week of my arrival in England I realized the urgent necessity of this measure. The Admiralties of the allied Navy Departments from the time we declared war, offered us complete access to all information at their disposition and to all the experience they had acquired. It was, therefore, only a question of having a sufficient number of trained assistants to collect this information, to put it in proper form, and transmit it to Washington. It must be remembered that the responsibility for gathering this information rested mainly on me. I was aware of our own needs. Every man in the allied services was occupied with a real job. They had no time to worry about what we knew or didn't know. The naval attaché with his two assistants, one an officer of the Supply Corps, the other of the Medical Corps, had been fully occupied with the duties imposed upon them by prewar conditions, and although they rendered such assistance as they could, they were not placed under any orders until a later period. The task of getting the information we required was a very difficult and tedious one. It meant digging through records, and it meant following up sources of information, wherever they might lead, out into the fleet or elsewhere. From the present viewpoint it is almost impossible to conceive of the wall of secrecy that was necessarily maintained around allied war operations and the allied

Digitized by Google

military services. I am sure every officer who had experience over there will agree, when he stops to look back, that our ignorance of the experiences of the war prior to our entry was indeed appalling.

Furthermore, in order properly to coordinate our own activities with those of the Allies, it was essential that we have available, in the war zone, a sufficient number of capable officers who understood the Allies, in order to profit by their experiences and to keep our own forces in the closest possible harmony with them. The importance of this is now generally recognized. We find, for example, in the report of the Secretary of the Navy of the year 1918:

The outstanding accomplishment of the Navy abroad in this war, outside of rigorous and valorous service in the danger zone, has been the character and degree of cooperation, and practical consolidation, for the time being, of our services with those services with which we have been associated. The Navy, beginning with the arrival of the first ship abroad, has stood out for unity of command, even this in some instances involving sacrificing temporarily something of our identity as an independent service. It is believed to be a safe statement that the degree of accomplishment of our service in this respect is without precedent in allied warfare.

This quotation establishes the thorough and complete approval of that accomplishment by the Navy Department. It remains to be shown, therefore, the attitude taken by the department in 1917, in the critical months of the war, when I was requesting the assistance necessary to make possible this accomplishment, and when I was pleading with all the insistence at my command, that the department take some action.

To run through briefly, a few of the outstanding facts regarding the assistance given me by the Navy Department in this period. As I have stated, I went abroad with one aid. When I arrived in London I found in the naval attaché's office one line officer, the naval attaché, one officer of the Supply Corps, and one officer of the Medical Corps. These officers had been for some time in London, and each of them was already fully occupied before I arrived with a variety of tasks which precluded their giving me any great degree of assistance. They did everything in their power to assist me, as far as permitted by the paramount demands of their regular duties. In a very few days I found myself literally overwhelmed with the task that faced me, with every department of the British Admiralty and likewise the French Ministry of Marine, thrown open to us, and with insistent requests from many sections of the Navy Department at home for technical information of many descriptions. It was physically impossible for me and my one aid merely to collect the information requested, to say nothing of maintaining constant touch with the heads of the allied admiralties, and later directing the operations of our own forces in Europe, looking out for their supplies, etc. To complicate matters still further, all communications had to be converted into intricate codes, which was a tremendous task in itself, and involved hours of purely routine labor on the part of my aid, assisted by the small staff of the naval attaché; and this purely mechanical detail was added to the task of collecting, digesting, and collating the information to be sent to the Navy Department. It was for this reason that, in cabling the department on April 16, a week after my arrival, I said:

Advise sending McBride, also engineer and gunnery officer. All information now wide open.

Digitized by Google

Again, in my letter of April 27, in referring to this same recommendation, I wrote the department as follows:

APRIL 27, 1917.

All essential information has been covered by cable dispatch. Up to the present my time has been too fully occupied in ascertaining and confirming information concerning the military situation to give much attention to questions of material.

I strongly recommend that expert representatives of the Bureau of Construction and Repair, Ordnance and Steam Engineering, be sent here as early as possible, as all channels of information are now open. Such representatives should be of as high rank as practicable.

On April 29 I received from the department the announcement of my appointment to command the destroyers then on their way to Europe.

On April 30 I therefore sent the following cable:

Sent: April 30, 1917.

I acknowledge receipt of orders to command destroyer forces in these waters. As consultations with Admiralty will frequently be required, it is essential that I have experienced representative at base of our forces at all times. Therefore I request immediate detail of staff as follows: Pratt, chief of staff, and Taylor, Evans, or Daniels, or Coffey as aid; and Tobey. It is essential that Tobey be assigned in addition to his present duties. Sims.

PAGE.

It will be noted that I pointed out the need for a staff, requested specifically the appointment of Capt. Pratt to be my chief of staff, and asked for one aid out of three officers whom I named. I had every reason to believe that Capt. Pratt was available and would be assigned. I was under the impression that he was on duty as a student at the Army War College in Washington. I believe it was some time after this that he was assigned to duty in Operations, and it was considerably later that he was assigned as assistant to the Chief of Naval Operations, on the death of Capt. Chase. Not receiving any answer, about eight days later I cabled and asked information concerning the assignment of Capt. Pratt and an additional aid, stating that their services were urgently required.

Lieut. Commander J. P. Daniels was ordered on April 30, 1917, to proceed to Europe and report to me. He arrived Queenstown May 17, 1917, and was assigned to Queenstown base in connection with destroyers.

On May 11, in another cable to the department, I said:

Capt. Pratt's services urgently needed, specially owing to his previous service with me and his experience and knowledge of destroyer operations.

SIMS.

Similar requests for the services of Capt. Pratt were cabled to the Navy Department on May 21 and May 23.

On May 25 I received the following message from the department:

Capt. W. V. Pratt is not available for duty as chief of staff.

DANIELS,
Secretary of the Navy.

When I received this message of May 25, stating that Capt. Pratt was not available, but with no information as to what his duties were, or as to any other officers that might be available for this duty, I felt again the necessity of pointing out to the department the situation which led me to specifically request Capt. Pratt. This was in my cable of May 27, which I will read you. This was sent evidently from Queenstown. [Reading:]

Digitized by Google

Sent: May 27, 1917.
To: Secretary of the Navy.
Through: State Department.

Begins: Returning London to-morrow for conference with Chief of Staff, French Navy. It is of particular importance that Capt. Pratt be sent at earliest moment as chief of staff. Situation is of such nature that success of operations and spirit of cooperation (coordination) might be endangered by an officer of wrong temperament and methods. From extended experience with Capt. Pratt, I know him to be peculiarly well adapted to requirements of this situation. In view of fact that strain of this position is not light, and responsibility is heavy, I request that selection of staff be based upon my estimate of my peculiar relations with officials of allied naval forces.

SIMS.

I received no answer to this cable, and throughout the remainder of the month of June I continued to be without any information as to whether or not assistance was to be sent me, or as to whether I was to have a chief of staff or not.

In the meantime I had endeavored to secure the services of a number of officers who had come to Europe on armed guard or other duty. Thus, for example, the steamship *New York* had been mined on entering Liverpool, on my arrival at that port. It became necessary, therefore, for her to remain some time at Liverpool for repairs. At the same time I learned that the *Minnesota* was tied up in London and would not sail for some time. At my request, the naval attaché, therefore, cabled the department, requesting that the armed guard officers of these steamers be assigned to temporary duty to help out in London. The department approved this on April 28.

The approval of the department that these officers should remain and assist me meant only while their vessels were held for repairs in England.

When in May, however, I requested their services for duty in Europe, the department disapproved by recommendation. Thus, on May 9, in a dispatch, I stated that there were petty officers on each of these vessels competent to command the armed guard, and requested that the officers be assigned to duty with the destroyer force.

Again, on May 14, I cabled as follows:

Sent: May 14, 1917.
To: Secretary of the Navy.
Through: State Department.

Request information concerning my request to retain Lieuts. Emmet and Van de Ver, whose services are urgently needed. Former's engineering knowledge proving of great assistance, and latter's knowledge of French renders him of great value. Both officers report having excellent petty officers capable of taking charge of their armed guards. Request immediate reply on Emmet, as *Minnesota* sails in few days.

SIMS.

At about this time the armed guard officer of the *Philadelphia* arrived at London, and I learned from him that the department desired a great volume of information along many different lines. I referred to this in my cable of May 16, in which I said:

Sent: May 16, 1917.
To: Secretary of the Navy.
Through: State Department.

I am informed by officers arriving on armed liners that department desires a great deal of information concerning military and material information. Urgently request that cable be used freely in acquainting me with information desired, and also in informing me of situation at home as affects forces and duties of cooperation here. Request that as many former destroyer officers, particularly those who served under my command, and are now on duty elsewhere, be sent over, either on vessels coming, or as stand-by reliefs for ships now here. Information urgently requested as to my

Digitized by Google

requests to retain Lieuts. Emmet and Van de Ver. Former sails in three days. Lieut. King on *Philadelphia*, who speaks French and Italian fluently, will also be of great service as liaison officer in coordinating work here and on the Continent. He sails in three days. Services of such officers will greatly facilitate duty here and aid in obtaining all information desired. It is of vital importance that all possible information should be obtained and transmitted rapidly, in order to prepare our forces for any future emergency. Services of Capt. Pratt as chief of staff are urgently needed.

SIMS.

The cable stating that Capt. Pratt was not available was not received until nine days after that dispatch was sent. I would like to invite attention here to that particular cable I have just read of the necessity of being able to send in all possible information about all possible details concerning the operations abroad.

In repeated cables I have assured the department that I have sent them all essential military information. That only covered the broad outlines of the situation. I wanted to be able to send them in information on all the specialties on the other side, so that they would be as well informed as possible of the conditions under which the submarine campaign was being carried out. I could not do it. It was physically impossible to do it with only two or three assistants. The consequence was, as you have seen by the testimony I have been giving for the last half dozen days, that time and time again the department in its cables exhibited an astonishing ignorance of the very elements of the submarine campaign, and I wanted to avoid that thing in the early months of the war, so that that thing would not happen. But I did not succeed because they did not give me the necessary personnel.

No reply was received for over two weeks. Lieut. Emmet, the armed guard officer of the *Minnesota*, was obliged to leave London when his ship sailed on May 16.

In a cable of May 31, I again referred to these armed guard officers, and requested authority to retain them for duty under my command.

When the *New York* was finally about ready to sail on her return trip, on June 12, I cabled again to the department, with regard to my request for the services of the armed guard officer, but was informed by a dispatch of June 14 that the return of this officer to the United States was desired.

In the meantime I continued to have only the services of one aide, together with that of an American in London who had resigned from the naval service in 1914, but who volunteered for duty with me, and was given a provisional appointment as lieutenant, by authority of the Secretary of the Navy, on April 16.

On May 21, I pointed out to the department that the staff that I had was entirely inadequate to make possible the handling of Navy codes. I therefore, said:

In order that our staff officers here be available for important military duties, it is urgently requested, as recommended in my previous dispatches, that the State Department's codes and staffs be utilized for all communications, except those of a special secret nature.

On May 15 I learned that Commander Morton, who had been in command of the *Scorpion*, our station ship at Constantinople, had succeeded in reaching Paris. As I had no information concerning the sending of officers from America, and as at this time the department had informed me of its intention to establish bases on the French coast, I cabled on May 15, requesting that Morton be assigned to duty in France, in accordance with his own request.

Digitized by Google

On May 18, I received a message from the Secretary of the Navy, ordering him to return home on the first available steamer.

On May 25, I cabled to the Secretary, pointing out that an urgent conference made it necessary to hold Morton for a few days, and requested that the department's orders be reconsidered.

On May 26, the Secretary of the Navy replied that Morton could remain for a few days, but should then carry out his previous instructions.

On May 31, after a conference with the French chief of staff, I felt it so important that we have officers speaking French, and familiar with European conditions, for this duty, that I cabled to the department, requesting the reconsideration of Morton's orders, and stated:

His language and experience urgently needed. Speaks French fluently and is unusually well equipped to assume command of one of the prospective French bases.

I realized that as Capt. Morton had but recently escaped from Turkey, the department, undoubtedly, was anxious to have his reports, and, therefore, stated in the cable that Morton was prepared to submit at once all of the information which he had acquired in Turkey.

The only reply that I received was a statement that Commander Morton should carry out his original orders.

Up to June 5, about two months after my arrival, the only additions to my staff made by the department were Lieut. Commander Daniels whose services were needed at Queenstown, and Surg. Pleadwell, assistant to the naval attaché, concerning whom the naval attaché received the following dispatch on May 26:

Please direct Surg. Pleadwell, United States Navy, to report to Vice Admiral Sims, United States Navy, for additional duty as medical aide.

DANIELS,
Secretary of the Navy.

On May 30, after conference with the French chief of naval staff, I cabled that the French chief of naval staff had expressed the wish that:

A representative of the Navy Department, not below the rank of captain, be assigned to the French Navy Department. Although I am in touch with the French department, through their naval representative here, and also by telephone and telegraph, and can always reach Paris in a short time, it is considered that the request should be granted, as it will ensure closer daily cooperation and coordination. It is also considered that active officers, preferably with knowledge of French, should be assigned to our prospective bases in France.

On May 31, having heard unofficially that it was intended to order home Tobey, the officer of the Supply Corps on duty as assistant naval attaché, both the naval attaché and myself cabled the department, pointing out that his—

Services are urgently needed, both in an advisory capacity, as well as for his wide acquaintance in official circles, and familiarity with the situation and methods pursued in the British service.

It will be remembered that I had requested on April 30 that Tobey be assigned additional duty as aide to me. Up to this time, a month later, I had received no reply from the department concerning this.

On reviewing the situation with regard to personnel at the end of May, on returning from Queenstown, and especially after my conference with the French naval staff, and learning of the plans which

Digitized by Google

the department had for the establishment of bases and the sending of forces to France, I felt that the situation could not continue longer as it was, and I therefore sent the following message, attempting to point out to the Navy Department that the responsibilities which devolved upon me, and the necessity of getting for the department the benefit of allied war experience, made necessary the sending immediately of sufficient experienced representatives. My dispatch was as follows:

To: Secretary of Navy, Operations.
Through: State Department.
Sent: May 31.

In the belief that the future security of the United States, or at least the accomplishment of our purpose in entering this war, will in a considerable degree be dependent upon the efficiency of the organization on this side, both afloat and ashore, it becomes my duty to specify the requirements, based on the situation here, which are necessary to the discharge of my full responsibility. Distance and methods of communication render it impracticable to convey to the department fully the peculiar character of the various situations that arise and the developments thereof. Decisions which I have to make may be of such far-reaching effect that my duty impels me to appeal for the assistance and facilities which I believe the situation demands. It is therefore urgently requested that the department approve a greatly enlarged organization, with a view to insuring that the department, fleet and the forces here are able to cooperate with the Allies to the maximum extent, and that they may fully profit in the future, as well as the present, by all available war experience ashore, afloat, material and otherwise. The importance can not be overestimated of having expert and experienced representatives, of all branches of our shore and sea forces, constantly in touch with the allied forces ashore and afloat, who are engaged in actual conflict. These representatives should be in the grand fleet, in the submarines, the patrol, and other services, gaining all possible experience and keeping in touch with the progress of all war activities. Experienced technical officers should be in London, to keep in touch with all departments of the Admiralty. The Admiralty have already suggested the advisability of our having a representative in the secret-service department, but no officers are available. It is necessary that I have an adviser concerning supply and accounting questions which have already arisen with the Admiralty. The supply officer of the *Melville* (which was at Queenstown) is already overburdened with local work concerning the destroyers, and can not keep in touch with the necessary work in London.

The requirements of the situation set forth above had led to request detention here of Morton, Van de Veer, Emmet, Tobey, and authority to enroll any one qualified for Naval Reserve Force. The organization requires greatly increased clerical staff; funds and authority to authorize expenditures under war conditions, as free as possible from detailed accounting as pursued in peace time. In view of the uncertain possibilities of this position the department's early action is earnestly requested.

SIMS.

That was May 31, about 2 months after we had entered the war.

In another message of June 1 I referred also to the desirability of cooperating with the allied secret service, and urged that an officer be sent from the United States to coordinate our secret-service work with that of the British.

In my letter to the department of June 1, 1917, I again emphasized the points which I have read you in my cable of May 31.

The cable of May 31 seems to have been sufficiently urgent in its tone to call forth a response, for on June 5 I received the following dispatch:

Received: June 5, 1917.
This cablegram is for Sims.

Quote reply to your cable of June 1. Department will afford you every facility which material and personnel conditions Navy permit. Technical officers from material bureaus have been ordered or will be order(ed). You are authorized to detain Tobey. *Dixie* coming with full complement of officers. Department disapproves of

Digitized by Google

(all) commissioning of personal (personnel). You have authority to employ necessary clerical assistance. Arrangement has been made to keep United States Navy force(s) supplied with fuel, provision(s) and spart parts existed repair. Authorize such expenditure as (may) be necessary to maintain your forces in efficient condition and for any purpose connected therewith. No. 23004.

DANIELS,
Secretary of the Navy.

NOTE.—This is the literal translation of the word as verified by repetition.

It will be noted that in this reply, the first information which I had received concerning personnel, it was stated that the department would afford me every facility which the personnel conditions of the Navy permitted, and that technical officers from material bureaus had been or would be ordered. Up to this time I had received no information, however, concerning these officers, and what is more important, the officers themselves had not yet put in an appearance, except in one case, that of Lieut. G. L. Schuyler, who had been ordered abroad by the Navy Department for the purpose of inspecting certain ordnance equipment being purchased from British firms not in London. He had reported in London to the naval attaché on May 26, but had no orders to report to me as aid, and his time was fully occupied by the duties which the department had assigned him, at least during the first months.

On June 8 in a letter to the department I again pointed out the necessity for coordinating our service with that of the Allies through the sending to Europe of an adequate number of experienced officers. My letter was as follows:

JUNE 8, 1917.

It is assumed that the primary purpose of the United States naval organization here in London is to serve as the coordinating link, on this side, between the department and the British and French admiralties, or, in other words, between the United States and allied naval services in prosecution of the war. It is therefore a duty to keep the department informed of any difficulties which may be encountered and the best means of correcting them as seen from the viewpoint here.

The paramount difficulties so far involved have been due to the lack of an adequate experienced staff, as fully set forth in previous dispatches.

It is also essential to the efficiency of the organization that the department's policy, plans, and intentions should be known in a general way at all times. It is for this reason that I have previously requested a weekly information dispatch for the sole purpose of information as to matters of policy and prospective plans, in order that the activities of this organization may be thoroughly coordinated with those of the department, and, what is more important, that our service may be at all times prepared for any developments or emergencies, and that its activities may be directed to an end of the maximum service to the allied cause.

On June 10, I received a cable from the Secretary of the Navy, announcing that I was to inform Paymaster Tobey that he was to report for additional duty as aid to my staff.

I might say here in passing that in spite of all the recommendations which I had made, I had up to July 7, three months after my arrival in England, received only three additions to my staff. One of these officers had necessarily been detailed to duty at Queenstown; the other two were assistants to the naval attaché, ordered to additional duty with me. In the meantime, after the convoy system was put into effect and our troops began to move on the high seas, and my responsibilities were thereby greatly increased, almost daily it became necessary that I should have a competent officer for the

Digitized by Google

exclusive handling of these convoys. I therefore sent to the department on June 11 the following message:

Sent: June 11, 1917.
To: Secretary of the Navy.
Through: State Department.

18. Admiralty has requested, and I recommend, that a United States naval officer be assigned to me for exclusive duty in admiralty in connection with convoys and selection of rendezvous and similar important duties concerning movements our Government ships as affected by submarine campaign. Officer should be commander, as head of that admiralty department is a captain. Very important to be carefully selected with view of insuring desirable cooperation and relations. With increase of our military and naval forces in European waters, and their attending shipping for maintenance, the question of a convoy and routes will become increasingly intricate and important.

SIMS.

This recommendation I repeated in my letter of June 20 and in dispatches of July 1, July 3, July 5, July 9, and July 14, without ever receiving an answer, and, therefore, finally I was compelled to order the commander of one of the Queenstown destroyers to duty in London, in order to take charge of this important work, upon which the lives of our troops, as well as losses of valuable cargoes, was dependent.

I only wish that I were capable of describing the conditions existing in my office at this time. We were established in two small rooms in the Embassy, which had been kindly given us by the Ambassador, only at the expense of additional crowding of Embassy officials. Dispatches were pouring in on us every day. This is the period when we got a business man, a former American naval officer, to come in and help us, and also got the assistance of some stenographers from American business firms in London.

Incidentally, that business man paid the salaries of these stenographers for some time.

I will not even attempt to describe this remarkable situation, further than to say that the reason I became so insistent, was that we had reached the limit of the physical endurance of the personnel available.

There were simply not enough minutes in the day to accomplish the work that had to be accomplished—and with such important questions as troops moving on the high seas, dependent upon us for direction and control, it was quite within the range of possibility that a mistake might be made which would have resulted in disaster.

I fully explained the situation to the department, in repeated letters of about this time, as, for example, in my letter of June 20, to the department. [Reading:]

18. I wish again to urge the necessity for greatly increasing the staff under my command. It is wholly impossible for me to keep myself fully acquainted with the situation without an increased staff. The lack for an experienced Chief of Staff, with whom I am thoroughly acquainted, suited to the peculiar existent conditions, has been a great embarrasment. The need for at least one experienced representative, in the Operations Department of the Admiralty, has been pressing, and becomes more important daily. The time and attention of all officers of the Admiralty are fully taken up with pressing daily war duties. They can not keep me fully informed of the problems which may affect me, both owing to the lack of time and also to lack of knowledge of what I need; my information is therefore, chiefly confined to very important questions which require my action, and to that which I deliberately seek.

Digitized by Google

Again I want to point attention to the last sentence of that message, that I was only able to send in information which was confined to very important questions which required my action. I could not possibly send in the information which the department should have had to make it thoroughly acquainted with conditions of the antisubmarine warfare, and the result of that thing was, as you have seen by my previous testimony, a most amazing ignorance of the department, up to the latter period of the war, as to what the whole business was about.

As I have already stated, I received no answers to any of my dispatches regarding personal sent at this time until the 7th of July.

In the meantime I had cabled again to the department on July 1 as follows:

Sent: July 1, 1917.
To: Secretary of the Navy.
Through: Admiralty.

No. 66. I again urgently request the services of Capt. Pratt, and a commander, for duty in Admiralty, in connection with convoys. If Capt. Pratt could come at once, with department point of view, his estimate of situation would undoubtedly be of incalculable value, and remove any misunderstanding of the situation which may now exist.

SIMS.

When I received a cable stating that Capt. Pratt was not available, I did not know then what his duty was. I assumed that he was on duty, as I had known him to be, in the Army War College.

On July 3 I cabled to the Navy Department as follows:

Sent: July 3, 1917.
To: Secretary Navy.

No. 72. Again urgently recommend that a carefully selected commander be sent immediately, for duty under me in British Admiralty in connection with convoys. The Admiralty particularly desires this. If Capt. Pratt can not be sent as chief of staff, is Capt. Twining available?

Having learned, on July 3, of the death of Capt. Chase in Washington, and consequently, of the necessity for retaining Capt. Pratt in the Office of Naval Operations, I cabled again on July 4, as follows:

Sent: July 4, 1917.
To: Secretary of the Navy. (Operations.)
Through: State Department.

No. 75. Request services of Capt. Twining as chief of staff; also request services of Commander Cone for duty on my staff, or under my command.

SIMS.

And on July 5:

Sent: July 5, 1917.
To: Secretary of the Navy, Washington.
Through: State Department (enclair).

No. 78. It is physically impossible to insure efficiency my duty, and safeguard department's and country's interests, without immediate increase of staff. My responsibilities demand immediate dispatch, by first steamer sailing, of chief of staff and minimum of two additional assistants, with war college experience. Request Capt. Twining, Commander McNamee, and Lieut. Coffey.

SIMS.

In answer to this series of messages I received, on July 7, the following dispatch from the department:

Appointment of Capt. Twining as your chief of staff has been ordered.

Digitized by Google

And on the following day I received another message from the department confirming this and stating that a lieutenant commander had also been ordered for duty as aide.

The personnel situation which I had to face, at that time, was summed up in my letter of July 7, 1917, of which the pertinent paragraphs were as follows:

It is impossible this week to submit a full report of operations of our forces, and all other developments of interest and value to the department.

This is on account of the unusual strain which has been placed upon the organization here, and the total inadequacy of the staff available to handle it.

It has now become physically impossible to carry on the work with the personnel available. With all British officials individually engaged in the actual conduct of the war, it is wholly impossible for them to furnish me or my staff voluntarily with all the information which I should have, and it is necessarily incumbent upon me to join into British official activities and ascertain the majority of the information which the department needs by actual contact and observation. Such a course is manifestly entirely dependent upon the size of my staff and the demands made upon the time of myself and my staff.

As previously reported by letter and cable dispatch, the very minimum assistance which is necessary is a chief of staff an dthree subordinate aids experienced in staff work.

As reported by dispatch, it is physically impossible for the organization under my command to accomplish the mission for which it is assigned without an immediate increase of personnel.

In interviews with officers recently arrived from the department they indicate the possibility of a more or less fundamental misunderstanding between the department and myself. The misunderstanding is probably due to various causes, principal among which are—

(*a*) Difference of point of view, each more or less unknown to the other.

(*b*) Lack of full information on my part of the difficulties under which the department is working.

(*c*) The inadequacy of both written and cable communication; that is, the impossibility of fully explaining the phases of the situation or circumstances reported and the danger of misinterpretation of statements actually made.

I will, therefore, urgently recommend that from time to time an officer be selected from the department who is thoroughly in touch with the department's point of view and policies and sent on temporary duty to confer with me with a view of returning immediately to the department.

REQUEST FOR LIAISON OFFICERS.

As I have already pointed out, I had been also repeatedly informing the department of the necessity for capable officers for duty in Europe of a liaison character, in order that the war experiences of the Allies might be made available for the department. I have already referred to my cables in April and May on this subject. On May 16 I sent a letter to the Navy Department on this subject, pointing out how essential it was that competent American officers should be sent for duty in Europe with the various allied naval forces, in order that the department might be kept constantly informed of war experience and new developments. I had received no reply from the department or any indication that they had received or considered my recommendations up to this time—that is, three months after my arrival in London. In the meantime I learned that the various armed guard officers, arriving in English ports on passenger liners, had orders to proceed directly to London, on arriving in English ports, to obtain information for the department on special subjects. Thus, for example, on May 15, 1917, a lieutenant arrived in London and informed me that he had verbal orders form the Chief of Naval Operations "to get information as to the antisubmarine operations of

Digitized by Google

the allied forces; to ascertain if it would be practicable in any way to blockade the German submarines in the North Sea, and, in addition, to obtain any points which might be of value in connection with new submarine construction of the United States."

I should like to comment on that in this way: The Navy Department sends a rear admiral abroad, who is there with certain assistants. He has been there three months. He has been in almost daily communication with the heads of the allied navies. He bears a tremendous responsibility of the safety of all those forces and the safety of our troops. He is devoting all his energies to it. Still, the Department gives an order to a young, comparatively inexperienced lieutenent to run down from the port of arrival in Great Britian to London, pick up what information he can, and go back and give it to the Navy Department, with the avowed object of basing the action of the Navy Department on the result. If anything could possibly be more dangerous in warfare than that, I do not know what it is.

Thus, instead of depending upon the London headquarters to obtain this information, which could easily have been done, if I had had adequate assistance, because of the close relations which existed with the heads and various officials of the allied navies, the department apparently expected to obtain this information by having an armed guard officer spend a week in London during the time before his ship started on its return voyage to the United States. I have a letter addressed to me by this lieutenant, covering the subject which he talked about at the Admiralty, and the information which he obtained. It is too long to read here, but it would be interesting to include in the record as showing the variety of subjects on which he obtained information for the department, and in pointing out the way in which, by this method, the department was necessarily duplicating the work by sending a number of different officers, at different times, to the Admiralty to ask, from the same sections, approximately the same information. This happened so often in the early months of 1917 that at the beginning of August I received from the Admiralty a polite request asking whether it would not be possible to have all requests for information come through one channel, as the Admiralty had found that a number of officers had at different times asked for exactly the same information.

The CHAIRMAN. Are you placing this letter from the lieutenent in the record?

Admiral SIMS. Yes; I will do so.

Senator BALL. It should be placed in the record, I think.

Admiral SIMS. Yes; it is in the record, but it is too long and too technical to read to the committee, I think. It is there.

(The letter referred to is as follows:)

AMERICAN EMBASSY,
London, May 16, 1917.

From: Lieutenant R. C. Grady, United States Navy.
To: Rear Admiral Wm. S. Sims, United States Navy.
Subject: Report to Chief of Operations.

1. Upon my return to the Navy Department, Washington, I will make a report in substance as follows:

2. The trip over was uneventful except for the casualties to the *Conyngham's* circulator and the *Wainwright's* condensor. The casualty to the condenser of the *Wainwright* points to the military necessity of having two condensers.

3. In the vicinity of Queenstown and Fasnet there is an area of submarine activity which it is very important to patrol to safeguard shipping. There will be included in

Digitized by Google

the report of the Queenstown area many minor bits of information, chiefly interesting rather than instructive in character.

4. Before going to the Admiralty, I submitted an outline of my mission in London, a copy of which I will give to the Chief of Operations. This letter was presented to Admiral Jellicoe and sent by him to the division of antisubmarine affairs.

5. At the Admiralty in London an officer—Lieut. Commander Hichens—was assigned to introduce me to various officers who could give me information needed. Mr. Hichens also gave me information of a general character. I talked to Rear Admiral Alexander L. Duff, head of the division which deals with antisubmarine measures, with Admiral Edward S. Fritzherbert, Director of Torpedoes and Mining, and with Capt. Spear, head of the Mine Division.

6. Some of the details of the nets I made notes on but as I learned later that the details and drawings of all nets and mines were to be furnished or else had already been furnished to the Navy Department, I kept no further notes. I also got information as to the probable routes the submarines take in leaving their bases at Zeebrugge, Emden, and Wilhelmshaven through and around the area mined by the British.

7. The British have in general found it impracticable to maintain an adequate patrol in the North Sea which would seriously interfere with the passage of submarines through the North Sea on account of the number of ships needed. Two net barriers or barrages which were established in the vicinity of Dover to prevent submarines from passing through were finally partially carried away by the tide and sea and though parts of them are still in place no one doubts that some of the submarines pass over to Ireland by this channel.

8. Most of the German submarines and particularly the large ones after clearing the mine field off the German coast head directly for Fair Island between the Orkneys and the Shetland Islands and do not hesitate to pass through to the Atlantic. The British have found it wholly impracticable to net this passage. The submarines usually made a landfall at St. Kilda west of the Hebrides and thence down to the vicinity of Fastnet and the Scillys. They are usually out 20 days, eight of which are required for the passage to and fro. Submarines usually spend two-fifths of their time away from their base. As the Admiralty believe that the Germans have 150 submarines there are 60 submarines always out. The Germans are turning out about two submarines a week.

9. In connection with a scheme for effectively closing the North Sea by using mines and nets in conjunction with the patrols, the officers of the Admiralty consider it to be impracticable. The same thing was suggested several times by their own officers but after consideration was disapproved. The objections are given as the lack of necessary patrols, impossibility to maintain nets, impracticability to mine in water over 50 fathoms with anchored mines, and the undesirability of floating mines on account of possible danger to their fleet.

10. Patrols have been withdrawn from the North Sea except near the coast and near the channel. At present the general line of defense is the mined area in Heligoland Bight and the patrol of the areas of submarine operations.

11. The strategy regarding the Grand Fleet is still adhered to, with the view of its meeting the German High Sea Fleet in the near future.

12. The patrols are no doubt as efficient as their numbers make it possible for them to be but on account of the need of certain flotillas being kept ready with the fleet. the patrol is reduced so much in its effectiveness

13. The Admiralty are somewhat reorganized and will no doubt result in improvements, as the heads are relieved of much routine and details.

14. I will state as my opinion that the present lines of effort are defective to some extent.

15. At present the policy of maintaining the fleet is of prime importance and overcoming the submarine menace is of secondary importance. This is wrong because it will be the submarine that will (if anything does) bring about the defeat of the Allies, and not the German High Seas Fleet. As to secure control of the surface it is necessary to operate against the enemy on the surface, so to secure the control of the subsurface it will be necessary to operate against the enemy in subsurface areas. Surface craft could carry out submarine operations by dropping mines and depth charges if they could see the submarine. Not being able to see the submarine the only other way to gain control of the subsurface is to scatter mines everywhere in it so that a submarine can not operate in it. This, of course, can not be done over the entire ocean, but the North Sea presents an area which it is possible to control. Actual attempts to gain control there may prove it to be impossible, but it should at least be attempted. This will require the extensive use of mines and may interfere with the Grand Fleet, but even so, the movements of the Grand Fleet should be subordinated to the antisubmarine measure to whatever extent necessary.

Digitized by Google

16. If present patrols are just maintaining their own, and the German submarine force is to be almost doubled, in a year it will be necessary to double the patrol force.

17. I will also say as my own opinion that every possible chart that can be of service to the Allies in their antisubmarine campaign be immediately sent over. This for two reasons. The first is that there should be no chance for a complaint that the campaign was lost because the United States did not give adequate help in time; the second, that the submarine must be kept from getting stronger until more extensive mining operations can be carried out. It will also recommend that the manufacture of mines on a grand scale be relentlessly pursued in case of any failure of the patrols.

In addition to the armed guard officer of whom I have just spoken, there were many others who came to London with similar instructions from the Navy Department. I would like to include in the record at this point a letter addressed by one of these armed guard officers, to the Chief of Naval Operations, after his arrival in Washington. It is interesting as pointing out the realization which he, like every other officer who came to London, obtained of the problems we were facing once he was able actually to see them for himself and to visualize the situation. In his letter he emphasized the importance of having additional officers abroad to collect information for the department, and to assist in the administration of our forces overseas, and in the coordination of our work with the Allies.

I will submit that letter also for the record, as it is long and technical. The letter is as follows:

NAVY DEPARTMENT,
Washington, D. C., June 19, 1917.

From: Lieut. R. M. Emmet, United States Navy.
To: Chief of Naval Operations.
Subject: Additional personnel and forces in Europe; liaison officers and other matters.
Reference: Letter Vice Admiral Sims re information service, dated from London May 14, 1917, and his dispatches re additional personnel from time to time.

I. Additional personnel and forces in European waters.

(*a*) From observation abroad and discussion with officers of British Navy, I am convinced in a short time department will have to face problem of finding additional officers and enlisted ratings for our forces operating in Europe.

II. Liaison officers.

(*a*) Liaison officers are a development of this war. They were inaugurated by the French and subsequently adopted by British. They are used in both army and navy. They are considered indispensable.

III. Admiral Sims's staff.

(*a*) When I left London the demands on Admiral Sims's time, brain, and energy were enormous. They were increasing by leaps and bounds. There was ample work for almost any number of efficient officers of an active turn of mind, had they been there.

(*b*) It seems to me that both the importance of his mission and the widely scattered character of his command, together with the relatively weighty part it plays in the conduct of the war demand that the admiral receive the most efficient assistance possible.

IV. Explanation of purpose of this letter.

(*a*) Fundamentally I desire to bring to the attention of Operations my conviction of the paramount importance of I, II, and III above.

(*b*) While abroad I became thoroughly imbued with the fact that this war is being surely decided in the waters washing the coasts of Great Britain and France; to a lesser extent the Mediterranean, and nowhere else.

(*c*) From a week's contact with the Navy Department I am fully alive to the demands there are for trained officers.

(*d*) In spite of that, I am convinced that nothing should interfere with maintaining our forces in European waters at the maximum pitch of efficiency.

(*e*) It is possible in great measure to consolidate the functions set forth in I, II, III in the same body of officers, which under the circumstances seems desirable.

V. Discussing I, additional personnel and forces, European waters.

(*a*) I know Admiral Sims, after consultation with far more authoritative sources of information than those open to me, became keenly alive to the necessity of reserve personnel for the destroyer force.

Digitized by Google

(*b*) His dispatches indicate it.

(*c*) I have heard him say time and again that we would find 50 per cent necessary.

(*d*) The irreducible minimum be considered to be one-fifth, which on a basis of 30 boats would mean 6 captains and a proportionate number of junior officers and enlisted ratings.

(*e*) My personal conviction is that in the case of officers certainly, the department will find it must provide nearer one-half than one-fifth.

(*f*) The service is trying. It is work and no play, with a constant tension thrown in.

(*g*) I am sure it is not the admiralty's intention to retain all our forces indefinitely on their present service. It is drudgery. Undoubtedly, as time goes on, some of our destroyers will be transferred to east coast immediately facing enemy. Casualties are bound to occur.

(*h*) Casualties are bound to occur on present stations. There the danger of death and wounds is not so imminent, but we will surely encounter cases where officers must be given a rest.

(*i*) If reliefs are available, a few weeks' or months' change of duty may restore a valuable man to his full efficiency, and in the interim he may perform work of value as a liaison officer or on admiral staff, temporarily in London.

(*j*) If reliefs are not available the loss of efficiency of the force may prove cumulative due to increased strain on officers remaining.

(*k*) There is also the danger that men will be overworked to the extent that their services may be lost to the country for long periods of time, for the rest of the war, or forever.

(*l*) The British have met this time and again. The whole policy of the Admiralty is to make life aboard seagoing ships as livable as possible, even to the extent of sacrificing in some degree military efficiency.

(*m*) We were warned again and again it did not pay to strip ships to the bone, as they did to their cost at beginning of war.

(*n*) I feel absolutely confident that unless this problem is met squarely now it will be very much more embarrassing in the future.

VI. Discussing liaison officer.

(*a*) A number of officers have been sent abroad representing the various bureaus. They will undoubtedly render valuable service.

(*b*) I think arrangements ought to be made to have part of them return home from time to time and make their report personally. I believe if this was done the value of the information supplied department would be many times increased.

(*c*) Business by cable has its drawbacks. I have heard Admiral Sims say in discussing submarine situation, that Admiral Jellicoe had told him that we could not furnish too many mines; that a million was not too many.

(*d*) I have been informed since my return from abroad that the British did not want any mines from us. They must need them, and there must be a misunderstanding at long range.

(*e*) Officers in reserve for our destroyers can gain invaluable experience with the British forces actually facing the enemy. They can be changed from time to time so that the whole force will be leavened with everything our Allies have learned in three years of war.

(*f*) Officers temporarily incapacitated can render valuable service in London, and as opportunity offers, can be sent home to bring the actual seat of operations to the high command here in a way that can never be accomplished by correspondence by cable or by letter.

(*g*) I desire to invite attention to Admiral Sims's letter of May 14, 1917, re "Establishment information and liaison service." The subject of liaison officers is therein discussed at length.

VII. Interchange of information with our allies.

(*a*) Admiral Sims was informed by the Board of Admiralty that they had given orders to all departments of Admiralty that there was nothing confidential as between the two services; that they were willing and anxious to supply us with any and all information on any subject we might desire.

(*b*) I know I reflect Admiral Sims when I recommend that a similar policy of complete frankness be given serious consideration by us.

* * * * * * *

VIII. Need for destroyers.

(*a*) The Admiralty consider at the present time a destroyer to be literally worth her weight in gold.

(*b*) Too many can't be built.

(*c*) In my association with the Office of the Engineer in Chief in the Admiralty, and with various engineering firms, I became keenly alive to the difficulties of obtaining suitable gearing for turbines of our new 35-knot destroyers.

Digitized by Google

(*d*) Even if the gears be cut abroad there is always danger of loss in transit to this country.

(*e*) The need for destroyers is paramount.

(*f*) The British state if they had been able to force Germany's course of unrestricted submarine warfare, they would have now 200 more than at present.

(*g*) They feel confident that with 200 more they could surely control the submarines below the critical point—that is, prevent them sinking more merchant tonnage than the Allies can build. They admit to lack of vision.

(*h*) Our 742-ton destroyers are splendid ships.

(*i*) We know all about them.

(*j*) Every shipyard in the country is supplied with plans and patterns.

(*k*) It would be easy in view of our past experience to turn out quickly many 33-knot boats modeled on the *Jouett* and *Beale*, which were unqualified successes.

(*l*) A boat like the *Beale*, with 4-inch guns instead of 3-inch, and, if you like, three triple instead of three twin torpedo tubes would give a good account of herself against any destroyers in the world.

(*m*) For purposes of antisubmarine warfare she would be fully as efficient as the 1,000-ton boats.

(*n*) Most important of all, such boats can be turned out quickly.

IV. In conclusion, I felt impelled to submit this letter, as I felt in my seven weeks in England I had had an exceptional opportunity to observe conditions affecting the successful conduct of the war on the sea.

R. R. EMMET.

My great difficulty was in getting the department itself to realize this situation, and it was many months before I received any indication that they had come to this realization.

On July 9, for example, I sent the following dispatch:

[Cable dispatch.]

Sent: July 9, 1917.
To: Secretary of Navy.
Through: State Department (on clair).
Urgent: Please give priority.

87. In order to keep the department informed of the information which it requires, and which is essential to efficiency of our cooperation in this war, I must have men of special experience, training, and ability. With my knowledge of situation here, I urge immediate detail of at least three of following, in addition to chief of staff: Cone, Knox, Sterling, McNamee, Cotten, King, Pye, Coffey. Chief of staff must be free for independent and continuous estimate of situation. In addition, I must have competent commander, constantly on duty in admiralty in connection with convoy system and daily movements and operations of our forces, and at least two additional aids in my office. More are required. Replies to department's cables are now being greatly delayed, and other important military matters being postponed, owing to physical impossibility to keep up with current work. It therefore is my duty to urge that other interests be subordinated to the demands of the organization here, upon which efficient United States naval cooperation must necessarily primarily depend. I submit that safety of our ships, as well as efficiency of their operations, is dependent upon availability here of adequate staff.

SIMS.

SAFETY OF TROOP CONVOYS ENDANGERED BY INADEQUATE STAFF.

In further dispatches of July 14, 17, and 23, I again pointed out that the safety of all troop convoys was endangered by my lack of assistance: that the necessary and rapidly increasing work in connection with our cooperation with the allies, with the operations of our own forces, and of the obtaining of information for the department was practically overwhelming myself, my aid, and such members of the naval attaché's office as were able to devote time to assist me. Consequently, when the department cabled me an announcement of their policy on July 10, I replied in a long letter, fully setting forth my estimate of the requirements of my position and of the means

Digitized by Google

which seemed necessary to carry out this policy of the department, so far as operations in European waters were concerned. It would be interesting to read the paragraphs of this letter, dealing with these subjects. It will be noted that I fully stated to the department the necessity of having all plans for operations and the direction of actual military operations handled in the war zone, at a place where all information was available, and where cooperation and coordination with the allied military effort could be accomplished through personal conferences. I recommended this to avoid the inevitable misunderstandings, due to correspondence between men whose minds are running in different channels. My letter was as follows. I apologize for the length of this thing, but I think it is necessary to read it. [Reading:]

Letter No. 27, July 16, 1917:

14. The department's policy refers to willingness to extend hearty cooperation to the allies and to discuss plans for joint operations, and also to its readiness to consider any plans which may be submitted by the joint allied admiralties.

15. I submit that it is impossible to carry out this cooperation, to discuss plans with the various admiralties, except in one way, and that is to establish what might be termed an advance headquarters in the war area, composed of department's representatives, upon whose recommendations the department can depend.

I refer to exactly the same procedure as is now carried out in the Army; that is, the general headquarters in the field being the advance headquarters of the War Department at home, and the advance headquarters must of necessity be left a certain area of discretion and freedom of action as concerns the details of the measures necessitated by the military situations as they arise.

16. The time element is one of the most vital of all elements which can enter into military warfare, and hence delays in communications by written reports, together with the necessity for secrecy, render it very difficult to discuss plans at long range. The enemy secret service has proved itself to be of extraordinary efficiency.

Moreover, I believe it to be very unsafe to depend upon discussion of military plans by cable, as well as by letter. The necessary inadequacy of written or cable communications needs no discussion. The opportunities for misunderstandings are great. It is difficult to be sure that one has expressed clearly one's meaning in writing, and hence phrases in a letter are very liable to misinterpretation. They can not explain themselves.

17. One of the greatest military difficulties of this war, and perhaps of all Allied wars, has been the difficulty of coordination and cooperation in military effort. I am aware of a great mass of information in this connection which it is practically impossible to impart except by personal discussion.

It is unquestionable that efficiency would be greatly improved if any one of the Allies—Italy, France, England, or the United States—were selected to direct all operations, the others merely keeping the one selected fully informed of their resources available, and submitting to complete control and direction in regard to the utilization of these resources.

18. If the above considerations are granted, it then becomes necessary to decide as to the best location in which to establish such advanced headquarters, or what might be called an advance branch war council at the front; that is, an advanced branch upon whose advice and decisions the War Council itself largely depends.

I fully realize the pressure, and the influences, which must have been brought to bear upon the department from all of the Allies, and from various, and perhaps conflicting, sources.

I also realize that my position here in England renders me open to suspicion that I may be unduly influenced by the British viewpoint of the war. It should not be necessary to state, however, that I have done everything within my ability to maintain a broad viewpoint, with the above-stated mission constantly in mind.

19. From the naval point of view, it would seem evident that London is the best and most central location in the war area for what I have termed above the advance branch of our Naval War Council.

The British Navy, on account of its size alone, is bearing the brunt of the naval war, and hence all naval information concerning the war reaches and centers in London.

It will be quite possible for all of our advanced headquarters' staff, or parts or divisions thereof, to visit Paris and other allied admiralties at any time.

Digitized by Google

I wish to make it quite clear that, up to date, it has been wholly impossible for me with one military aid, to perform all of the functions of such an advanced branch of the department.

As stated in my dispatches, it has been evident for some time that I have been approaching a state in which it would be physically impossible to handle the work without an increase of staff.

The present state of affairs is such that it is quite within the range of possibility for serious errors to occur, which may involve disaster to our ships, due to the physical impossibility of handling the administrative and other work with the thoroughness which is essential to safety.

20. I consider that a very minimum staff which would be required is approximately as follows. More officers could be well employed with resulting increase of efficiency.

(1) One chief of staff, who should be free to carry on a continuous estimate of the situation, based upon all necessary information. He would be given the freedom of the operations department of the British and French admiralties.

(2) An officer, preferably of the rank of commander, for duties in connection with shipping and convoy, to handle all the numerous communications in relation to the movements of American shipping, particularly military shipping, and also other shipping carrying American troops.

(3) An officer, at least a lieutenant commander, for duties in connection with anti-submarine division operations in order to insure perfect cooperation in that field of work between our service and other allied services.

(4) An officer, of all around ability and discretion, for duties in connection with general military intelligence. He should be in constant touch with the secret service departments of the admiralties, in order to insure that all military intelligence which in any way affects the Navy Department or our forces is properly and promptly acted upon.

(5) At least two lieutenants, or lieutenant commanders of the line, in my own office, in connection with general administrative questions, in addition to the one now available. The necessity for these additional officers is imperative.

(6) One communication officer to take general charge of codes and communications, both with the department at home, the allied admiralties, and with the various bases of our forces in the war area (at present Queenstown, Brest, Bordeaux, St. Nazaire, London, and Paris).

(7) A paymaster, to have complete charge of all financial matters connected with our naval organization abroad. This officer should be in addition to Paymaster Tobey, who is performing necessary and invaluable service on my staff in connection with all logistical questions.

I very well remember the preparation of that dispatch, and the question arising as to whether we should state what we ought to have, or something near what we thought we ought to get. Anyone who knows anything about military procedure knows that what I asked for there is not what I should have had; but as this was then the 16th of July, and we had not been able to get anything to speak of up to that time, I saw the utter impossibility of success in demanding the kind of an organization that I should have, and that I eventually did have.

Not until some of the authorities in Washington visited the other side, after the sixth or seventh month of the war, and saw the situation did they realize the facts, and begin to give us the staff which was adequate.

In other official letter-reports, written about the same time; that is, on July 14 and July 18, I again pointed out that it had become impossible for the staff then available to keep up with the necessarily increasing work. In letters of July 18 I said:

For this reason, replies to department's cables and adequate reports of operations have been delayed. Although I have only asked for five additional staff officers, there is, nevertheless, ample work for many more, and it would be in the interests of the efficiency both of the department and our forces, if the staff were too large rather than too small.

At the end of July I also pointed out, in cables to the department, how essential it was, in order to insure quickness and certainty in our communications, that I should be sent capable officers, familiar with cable communications, with code work, and with radio.

On July 23 I received a message from the department, finally announcing the sailing of Capt. Twining as my chief of staff, with two lieutenant commanders as aides, and also two lieutenants, for communication and radio duty, for which I had specifically requested assistance.

In my letter No. 52, of July 30, I made the following comments with regard to the action of the department:

In closing, I wish again to call attention to the necessity for an adequate naval staff abroad. I have received the department's notification of certain young officers who are being sent, apparently for staff duty. I have tried to make it clear that the department's interests can not be efficiently served without an adequate staff of experienced men of adequate training.

The young officers who are being sent will, of course, be of assistance in handling routine administrative matters, but the urgent need is for men of much more experience, who will be capable of collecting all information which is available, concerning the general situation, and from it preparing estimates of the situation concerning broad questions of policy, and plans of operations upon which the United States naval efforts may be safely based.

I fully realize the demands being made on the naval personnel at home, but as the naval staff organization abroad is the one coordinating link between the current allied war situation abroad, and the department, I submit that its demands should take precedence over a large majority of other demands, made for training and other purposes at home. I feel and have tried to explain in my previous dispatches and letters, that if I could have here a council of perhaps four officers of experience of the type of Capts. Pratt, Schofield, or Commanders Knox, Stirling, Cotton, I could be assured of accomplishing the mission which I am sure the department expects of me.

TECHNICAL OFFICERS NEEDED ON STAFF.

While I was assured by the department, four months after my own arrival, that five officers would arrive for staff duty, I had yet received no reply to my repeated requests for the sending of technical officers, to report to the different bureaus in the department, and to obtain for them the technical information and data available in the allied navy departments, which it was essential the Navy Department should have for carrying out its own plans for the preparation of our American naval forces for war.

It will be remembered that in April I had requested that Naval Constructor McBride be sent abroad for such duty. He arrived four months later, in August, and was the first of such technical officers to be sent in accordance with my recommendations.

On August 9 I wrote the following to the department concerning his services:

Naval Constructor McBridge has reported for duty. He will be of great service not only in obtaining general information of value to the department and the fleet, but also for staff duty concerning his bureau in connection with the forces here. He will generally keep in touch with any unusual or extended repairs under the Bureau of Construction and Repair, advising me where my action is necessary, and generally acting as a representative of his bureau.

In a cable of August 13 I pointed out how confused the mine and depth-charge situation was, because there was no American officer in London familiar with the Navy Department's plans and policies, and no British officer in Washington at that time fully acquainted with all the British experience and developments; but no such offi-

Digitized by Google

cer was sent by the department. Fortunately I was able to avail myself in this connection of the services of Lieut. Commander Schuyler, who had been sent abroad by the Bureau of Ordnance to inspect shells being purchased by the bureau in Great Britain.

In my letter-report of September 7 I again pointed out the necessity for officers for this liaison duty. I will read one paragraph of this letter:

5. Liaison officers: I would again renew my recommendations that carefully selected liaison officers be detailed for duty with the various units of the allied forces.

It would be extremely useful to me as well as to the department, for example, if a competent officer of general ability were assigned permanently to the main allied fleets and also to detached forces which are not operating in direct conjunction with United States forces—for example, the Harwich light cruiser and submarine force and the British submarine force in the North Sea. I consider that the assignment of an officer to the French, Italian, and British main fleets would be productive of a great deal of useful information to our service, as well as regards questions of policies which arise in the department.

Up to the end of October, 1917, the only officers that I had received from the department for staff duty were the three previously mentioned, the five sent in July, to whom I have referred, and Naval Constructor McBridge, who arrived in August. I had been obliged to detach a number of officers from vessels operating in Europe in order to handle the constantly increasing burden of staff work. It probably would not have been possible to accomplish the work at all previous to this time if I had not been authorized (as I shall point out in a moment) by the Bureau of Navigation to enroll in London nine young Americans, many of whom had been Rhodes scholars or in the service of Mr. Hoover in the Belgian Relief Commission, who had volunteered their assistance and in some cases had been working for me voluntarily and without pay as civilians for a month or more before authorization was received from the Bureau of Navigation to enroll them as naval reserve officers. All of our communications with the department and with the forces, including the coding and decoding of such dispatches, were handled by six of these young men, and my staff was thus relieved of mechanical routine work and permitted to perform other duties of a more strictly military character. Two of these young reserve officers similarly took over the routine of the office administration, secretarial work, etc., and thus further relieved the regular officers of routine duties.

In a letter of August 23 to the department I pointed out the situation which existed and the necessity of increasing the number of trained assistants.

It may be pointed out that on October 1, 1917, there were in European waters 73 naval vessels and 15 shore stations, comprising 652 officers and 9,500 men, and yet to administer these forces, to control operations, and at the same time to keep in constant touch with the allied admiralties, and to acquire information for the department about all allied war experience, I had available in London only six regular offices, sent abroad by the department for staff duty, and two officers whom I had ordered up from the forces afloat. In addition there were four officers in the naval attaché's office who were assigned additional duty on my staff. You may be able to under-

Digitized by Google

stand more completely this need for assistance if I read some extracts from my letter of October 23, 1917. [Reading:]

OCTOBER 23, 1917.

From: Force commander.
To: Secretary of the Navy (Operations).
Subject: Need for an increased staff for the force commander.

1. As the war progresses and the activities of our own forces, increased by the addition of new units to the forces operating in European waters, and as new activities are added, as, for example, the matter of aviation of French and English stations, the purely administrative work at the headquarters of these forces has increased, is now increasing, and may be expected to increase.

2. In addition to the administrative work, which must be disposed of from day to day, if the forces are to be kept in continuous and efficient operation, there is most urgent need for planning and deliberative work, if the operation of our forces are to be intelligently conducted, in full and efficient cooperation with those of the Allied powers.

3. It is plain that the two classes of work can not be performed by one and the same staff of officers, but should be entrusted to two separate staffs, one of which should be purely a deliberative and planning staff and the other purely an administrative staff.

4. I now have, aside from the naval attaché, 12 officers who are either actually attached to my staff in London or are assistants to the naval attaché and doing staff duty in connection with the administration of our naval forces in Europe. The inclosed office memorandum shows the distribution of duties among these officers. One of these officers, Lieut. Gillmore, is a reserve officer (formerly in the Navy), and there are, in addition to the 12, a number of recently enrolled reserve officers who are performing the routine office duties indicated in the memorandum.

5. All of these officers are working to the utmost limit in keeping the administrative work up to date, and the number is still insufficient for present needs, and will be still more inadequate as the activities increase.

6. The immediate needs for increase are as follows:

(*a*) An officer to relieve the chief of staff of the major portion of his administrative work and leave him free to fulfill his more important function of military adviser and chief of the planning staff.

(*b*) An officer to take charge of all aviation matters that must be handled in this office, and act as the liaison officer between myself and the British Admiralty in these matters.

(*c*) An additional assistant to the intelligence officer. A vast amount of military information comes into the office, and much more could be secured, if my staff were large enough to permit of its being properly examined and digested.

(*d*) An officer to whom all personnel matters may be entrusted. Lieut. Commander Ancrum has until the present time handled these matters, but owing to the absolute necessity of furnishing an assistant to Commander Long (who was in charge of the convoys) he has been detailed for that duty, and personnel matters turned over to Lieut. Gillmore, who owing to having been out of the service for some years is somewhat out of touch with service matters, and in any case, should be in a position to devote his whole time to his secretatial duties which are not light.

7. For the planning staff, I believe that it will be necessary that not less than five officers be made available in addition to the chief of staff, who should be the head of this organization. Such a staff could, and would, work in close cooperation with a recently established planning staff of the British Admiralty. By this means close cooperation between the two services could be secured, and facilities furnished for impressing our views on the British Admiralty to a much greater extent than has been possible in the past.

10. I trust that the department will share my views as to the necessity and urgency for increasing my staff in the manner, to the extent, and for the reasons, set forth above, and I request that the necessary additional officers be ordered to this duty as soon as practicable, since every day's delay increases the burden thrown upon me and my existing staff, and makes more urgent the necessity for additional officers.

WM. S. SIMS.

P. S.—With reference to paragraph 7, I wish to make it quite clear that the whole object in establishing a planning staff is to insure that I may be in a position to give the best and most thoroughly considered advice to the department as to proposed operations of our naval forces abroad.

Digitized by Google

It should be especially noted, that, in making requests for officers now, as in previous letters and cables, I distinctly specified that, while I often mentioned officers by name, these names were given to indicate the type of officers required, more than to indicate that that officer alone would be suitable. In many letters requesting personnel, I had specifically pointed out that, with the exception of Capt. Pratt, whom I had especially desired because of our previous relations and our mutual understanding, the officers I had named were only intended to indicate the type of officer. It is, of course, true that I would have preferred the officers that I named, but there were many other officers in the service of similar qualities who would have been equally suitable for the work.

Of course, this lack of staff seriously embarrassed me and rendered my work less effective than it would otherwise have been, as I wrote the Secretary of the Navy, in a personal letter of July 31, 1917, in which I said:

LONDON, *July 31, 1917.*

MY DEAR MR. SECRETARY: You may be sure that I have been doing my best to carry out the department's wishes in the performance of this rather delicate and difficult duty. I have not been able to do so to anything like my own satisfaction and, I fear, that of the department. This has been due to the physical impossibility of doing all that should be done, due to the fact that I have with me only one aid in my office and one aid at the flotilla base. I hope the department will see its way clear to give me a staff of really efficient officers of such size as to enable me to send in all of the important information which became available immediately upon the outbreak of war.

Very sincerely, yours,

WM. S. SIMS.

The Hon. JOSEPHUS DANIELS,
Secretary of the Navy,
Navy Department, Washington, D. C.

Again, in my official letter report to the department, of November 15, I informed the department of the continued necessity for additional assistance. [Reading:]

Letter 2629, November 15, 1917:

8. *Increased staff.*—The necessity for an increased staff grows daily. As previously reported, practically the entire time of the present staff is now taken up with administrative work which can not be avoided and for which the staff is inadequate. It is realized that the department depends to a considerable extent upon this organization to furnish it with complete information of the progress of the war upon which its plans must be largely based.

The British Admiralty has been severely criticized for not having an efficient policy, and particularly for not having plans projected sufficiently into the future to forestall enemy plans. Without going into the merits of these criticisms at all, and viewing the problems from our point of view alone, the question is a serious one as to the best means of insuring our efficient participation in combined naval plans for the future. In view of the vital element of time, and the impossibility of efficiently formulating combined plans at long range, the most efficient course for us is believed to be the assignment of a force of capable officers to actually participate with the Admiralty in the preparation of all plans.

The decision on our part in regard to all plans must of necessity remain in the Navy Department, where the ultimate responsibility rests and where all information bearing upon our participation is available.

The point that it is desired to stress, however, is that, with the present staff here, it is entirely impossible to keep the department informed fully of the progress of the war, and particularly to assist it in the formulation of plans for the future.

In a personal letter to Admiral Benson, of October 9, 1917, I had pointed out much the same condition. [Reading:]

You will note from the reports to be made by Admiral Mayo, the amount of information his large staff was able to dig out in a comparatively short space of time. That

Digitized by Google

sort of work can be accomplished only by men who can devote their exclusive attention each to one specialty.

It was with the object of being able to do this that I was so insistent in requesting more assistance when I first came over here. I am glad to say that the officers and men who have been sent over eased up things very considerably, but I think you should know that conditions in this respect can not be satisfactory to the degree indicated above unless I have a sufficient personnel to be able to keep some of the officers continually at work in departments of the Admiralty. It is only by this daily contact and association that we can keep thoroughly in touch with what is going on. The people of the Admiralty are working to the limit, and we can not expect them to think of and supply us with the things which would be desirable for us.

As an example of what I mean, I may say that I had hoped that when Twining and the others arrived here they would be able to spend at least a considerable amount of their time working with the people in the Admiralty. It was my intention, and theirs, that they should do so, but unfortunately the amount of work to be done is continually increasing and has increased to such an extent that this has proved impossible.

You will realize, I am sure, that I am speaking in this respect only of a certain type of officer. The officer who is the ordinary run of the mine could not be advantageously employed in this manner. It is as specialized and as important a kind of work as that which is being done by your able assistants. The type of man to which I refer are as follows: Stirling, McNamee, Yarnell, Knox, Coffey, Cotton, etc. We should have five such officers if we are to carry on this work efficiently and keep you properly informed.

ARRIVAL OF ADMIRAL BENSON IN EUROPE.

When Admiral Benson finally arrived in England, in the middle of November, 1917, it took him only a few days to convince himself of the necessity of establishing a real advanced headquarters of the Navy Department abroad, with an adequate staff to make possible full cooperation with the Admiralty, to prepare plans for future operations, and adequately to cooperate with the Allies in coordinating all activities. I had been recommending such action for five months, and specifically in my letters of May 16, July 16, and October 23, had pointed out the necessity for the establishment of such an advanced headquarters abroad. Similar recommendation had been contained in many of the cables, as you may remember, which I have read you in the last few minutes.

Then on November 17, 1917, the department sent the following dispatch to Admiral Benson, then in London:

Simsadus.

1160. For Benson. After thinking carefully subject feel that it would be to advantage if we have a permanent War Staff in England, as a part of the plans department of the Admiralty. If this meets your approval, additional officers will be sent to augment those already in England who are fitted for this work. 19016.

BENSON.

As I have before explained "Benson" was a cable signature showing that the message emanated from the office of Naval Operations, so there will be no confusion when you see a message sent from Washington and signed "Admiral Benson," although Admiral Benson is on the other side.

Admiral Benson replied as follows on the following day:

[Very secret.]

1530. Your 1160. Subject has been under discussion with Admiralty several days before receipt your message. Definite plans submitted to Admiralty. Am waiting decision. (Signed) Benson. 15118.

SIMS.

Digitized by Google

On November 19 he sent a further cable, outlining fully his recommendations to carry out this plan. His cable was as follows:

[Very secret.]

To: Opnav, Washington.
1550. For Secretary of the Navy.

I have gone over the situation fully with British Admiralty, and outlined what I believe to be best plans for future Naval Operations, but am convinced that British are not prepared now to offer definite plans of their own for our consideration. From my observations, and after careful consideration, I believe that such plans, satisfactory to both countries, can not be developed until we virtually establish the strictly planning section for joint operations here, in order that the personnel thereof may be in position to obtain latest British and other Allied information, and to urge, as joint plan, such plans as our estimate and policies may indicate. This action appears to be all the more necessary, considering the fact that any offensive operation which we may undertake, must be in conjunction with British forces, and must be from bases established or occupied within British territorial waters.

The officers detailed for this duty should come here fully imbued with our national and naval policies and ideas. Then, with the intimate knowledge they can obtain here, from data available, actual disposition of allies forces, reasons therefor, they will be in a position to urge upon British any plan that promiess satisfactory results.

In order to initiate this policy, I recommend that Capt. Schofield and Commander Know be ordered to report to Vice Admiral Sims and Admiral Jellicoe, first sea lord, for this duty; a third officer to be selected after my return.

This matter is an urgent one, and action should be taken at once.

Capt. Pratt cable me his recommendations for officers to fill vacancies created thereby in department.

Acknowledge. 19319. (Signed) Benson.

SIMS.

The department replied immediately, on November 21, with the following dispatch:

[Very secret.]

Sims due.

1230. For Benson. Your 1550 acknowledged: reply thereto. Schofield and Knox will be ordered.

BENSON.

Thus, a recommendation which I had been making for six months was not carried into effect until Admiral Benson, during his short stay in London, convinced himself it was justified, and recommended to the Secretary the establishment of such a planning section for my staff in London.

It is hardly necessary to repeat that this is merely another instance of the attitude of the department during all of those first critical moments of the war. My recommendation for months were allowed to go unheeded. The efficiency of our cooperation with the Allies was seriously impeded during this period by the failure to act on the recommendations made by their representative abroad, who, in accordance with departmental instructions, was fully cooperating with the allied admiralties, and made these recommendations only after full consultation with them.

The soundness of the policy was again demonstrated by the fact that the department adopted it, and throughout the remainder of the war continued to recognize, though sometimes grudgingly, the necessity for what had been continually recommended and which should have been obvious from the very first.

During the six months following Admiral Benson's visit I continued to be without an adequate number of assistants. This I

Digitized by Google

pointed out in my letter-report of the 19th of December, 1917, in which I said:

[Letter 4844, December 19, 1917.]

STAFF REQUIREMENTS.

The staff work required on shore, both in London and Paris, and at our bases, is steadily increasing. In spite of the additional officers who have recently been ordered to this staff, the necessity for further increases is rapidly developing. This is in accordance with experience of allied Governments and armies. It has been particularly impressive to learn of the requirements of staff work in allied admiralties and in the field. It is, of course, manifest that all operations afloat or in the field are dependent for their efficiency upon planning and administrative staff work. This is work which can not be dispensed with, and must be provided for even at the cost of active combatant personnel.

The planning staff which will be created here on the arrival of Commanders Schofield and Knox will soon be in need of assistance which can not be supplied with the present available officers.

Similarly, in my letter of December 31, 1917, I said:

The demands upon the staff organization ashore upon which the efficiency of our operations afloat are entirely dependent have grown steadily from the beginning, and are still growing. In addition to the direction of the activities of the forces afloat, and the administration work which is unavoidably involved, it is a tremendous task to attempt to keep fully informed of all developments and condition in the allied campaign which may affect our plans.

This same report was made to the department in many later letters, as, for example, in my letter of January 8, 1918, No. 6044, paragraph 10.

In my letter of March 23, 1918, No. 1223, I said:

The peculiar requirements of all staff duty performed abroad, in cooperation with allied services, makes the duty of a nature for which there was no peace training. It has been necessary to depart from all precedents, and to be governed by the greatest care in establishing and maintaining efficient relations between the services. It is for the above reasons that the force commander has so many times in the past, in asking for officers for staff duty, laid stress upon particular types and personal characteristics, and upon the necessity of permanence of assignment.

VALUE OF PERSONAL TOUCH.

I had from the first been impressed with the importance of coordinating the work abroad with the work of the Navy Department. Many misunderstandings inevitably arose as a result of the lack of personal touch, on both sides of the ocean. I was very glad in 1917 to have Admiral Mayo and Admiral Benson come abroad, in order that they could see the situation for themselves, and be in a position on their return to inform the department of some of the problems to be faced in Europe. In repeated letters to the department, personal letters as well as official letters, I had emphasized the importance of having officers frequently exchange between Washington and Europe, in order that the Navy Department and the headquarters of the forces abroad could be brought into more intimate contact with each other, and thus obviate many of the difficulties which arose from inevitable misunderstandings.

These difficulties were increased by the tendency of the department to demand, and require, full and complete explanations of every request made to them, and of every detail of the operations of our forces before they would approve such requests or sanction such operations. I could mention many illustrations of the depart-

Digitized by Google

ment's demands in this respect. Thus, for example, I have already pointed out that in a case of recommendations for an increase in the forces abroad, for the adoption of the convoy system, for the sending of a division of battleships to the grand fleet, for the sending of tugs and submarines as reenforcements, the department failed to act for many months, chiefly because they apparently did not consider that they had full information in Washington, although, as I pointed out repeatedly, such full information could not be communicated under the conditions existing because of the necessity of secrecy, because of my lack of assistants to forward the information desired, and because of the necessary delays and misunderstanding attendant upon cable and letter communications.

A few cases will show the department's attitude. On May 18 I received a cable from the department in which it was stated:

> It is essential that the department be promptly and fully informed of all operations of our vessels acting with the allied naval forces.

In reply I assured them I had outlined the general operations of our own forces, had pointed out difficulties of communications, and had stated that the department would be informed of all important developments or prospective changes in general plans.

In a cable of July 5 the department stated:

> In view of requests made and our efforts to respond, must insist that any plans for operations under consideration be submitted for our study.

In a cable of June 24, replying to various dispatches and letters which I had sent, the department again insisted that while it was willing to cooperate in any way, it would only consider "the question of supplying additional naval forces * * * whenever the advisability of so doing is justified."

The department seemed disinclined to take any action or indorse any recommendations, unless the fullest and most complete explanation could be made, and this was extremely difficult, if indeed not quite impossible. I was at that time working nearly alone, and lack of time and the difficulties of communication made such full explanations quite impossible. In many cases it took weeks to explain to the department something which could have been dealt with in 10 minutes, if I could have gone to the Navy Department and discussed the matter personally. As I have already pointed out, in dealing with the plans for protection of shipping against a battle cruiser raid, it took nearly two months to obtain an agreement upon a plan for meeting these raids.

This could probably have been settled in a few hours of conference. I was in complete accord and in constant consultation with the allied admiralties. No recommendation was made to the Navy Department by me until it had been fully discussed and agreed upon with them. I might say that in those first few months it was infinitely easier for the commander of the American forces in European waters to cooperate with the allied naval forces, in spite of all the differences and difficulties which inevitably exist between allies than it was to obtain action from his own naval department.

In its cable of July 10, 1917, announcing its general policy the department again, while announcing its willingness to cooperate fully with the Allies, yet insisted upon decisions being made by the Navy Department and insisted that the emergency warranting any

Digitized by Google

action should be fully explained to the department. As I have already pointed out, and as the department later came to recognize, it was possible to cooperate with the Allies only by giving the commander abroad and the department's representative in council with the Allies authority to discuss matters with them and to act as the representative of the Navy Department and in that capacity to make decisions as to actual operations required by sound military policy.

Thus on October 13 I reported to the department that a special squadron of yachts had been organized on the French coast. On October 16 the department cabled:

Inform department reason for and mission of special squadron under Commander Freemen.

I replied in my cable of October 17:

[Cablegram sent Oct. 17, 1917.]

To: Opnav, Washington.
Via: N. C. B. 18bR.
Copies to: C. on S., J. V. B., B. A. L.

923. Opnav 594. Special division under Commander Freemen will consist of *Aphrodite*, *Corsair*, *Alcedo*, *Wakiva*, *Noma*, and *Kanawha* and will be used primarily for escort of convoys. Other yachts not suitable for this duty. Reassignment of yachts to divisions in accordance with speed, radius, and so forth will be submitted to department for approval at an early date. 62017.

SIMS.

That is exactly parallel to what would have been the case if the Secretary of War had telegraphed to Gen. Pershing and asked him to report immediately why he had moved a brigade over a couple of miles to the right.

Again in December, 1917, after the arrival of our battleships with the Grand Fleet, it was recommended, after a conference between Admiral Rodman and the commander in chief of the Grand Fleet, that a fifth American battleship be sent abroad in order that, when one of the ships was under repair or docking, there would be a full division of four ships ready to put to sea at any moment. This was essential, as the Grand Fleet was under four hours' notice at all times, and it was imperative that the fighting effectiveness of its squadrons should be at all times unimpaired.

The department, not understanding in detail the reasons for this request, cabled as follows on January 5:

[Very secret.]

Simsadus.

If the reason for asking for the U. S. S. *Texas* to be assigned to group 9 is as stated to make a division of five ships, this reason the department does not consider a valid one, as it breaks up and is counter to our battleship organization. If, however, a real need exists for one more battleship, provision can be made to send one, though the department would prefer to send a division if the supply question will admit, rather than break its organization. 19005.

BENSON.

That is putting a paper organization against the necessities of war. I replied in my cable of January 8, which is as follows:

[Very secret.]

2781. Your 2010. My 2286 did not state reason for asking for *Texas* was to make a division of five ships, but stated that in order to insure four ships continuously in battle line a fifth ship was necessary. A real need does exist for one more battleship and this should be the *Texas* in order that there may always be one ship and usually two with 14-inch guns at our end of the battle line. Need for another division of battleships not sufficient at present to justify additional strain on supply lines.

SIMS.

Digitized by Google

I might explain there that our division was employed on one of the wings of the Grand Fleet, with a corresponding division of British ships on the other end, and it was very desirable to have the 14-inch guns there.

On January 11 the department cabled me that the U. S. S. *Texas* had been assigned to this duty and would sail immediately.

Another case illustrating the same hesitancy of the department to act on recommendations, until the whole matter was explained in detail, is illustrated by the plans proposed for establishing a docking schedule for our battleships in European waters. In a letter of August 13, 1918, I had made full recommendations as to how our ships abroad could be sent home and docked in rotation provided one additional battleship could be supplied by the department.

I might state there that the difficulty on the other side was in finding docking facilities for our vessels in addition to those of the Grand Fleet, and also the desirability of giving our people from time to time a run home. It was a frequent apprehension that the long period of service in the Grand Fleet might eventually get on the men's nerves, and to a certain extent affect the morale; that was the opinion throughout the war in the British Navy; and everybody was delighted to find that that opinion was not a sound one. But it was reasonable to suppose that men who stayed on board ship for four solid years without ever being allowed to leave for more than four hours at a time, and during that period having twice to go to a certain place and see whether a telephone message had not called them back, would be liable to be affected. It would be liable to get on the nerves of any man.

I cabled the department on September 6, 1918, asking early action. On the following day the department replied that an additional battleship was not available, but that the plan was approved, if it could be carried out without this additional battleship. It was, however, quite impracticable to carry out the plan unless the additional battleship could be supplied, as Admiral Rodman informed me in his cable of September 9, when he said:

My proposed plan can not be carried out with only five ships, as it would not be possible in this case to send home one battleship for docking, out of the five available, and still maintain in fighting condition the division of four ships with the Grand Fleet.

The matter was explained as fully as possible to the department by letter and by cable. Then, on October 3, 1918, the department suggested a new plan of its own. This plan involved a rotation of battleships between divisions 6 and 9, which were in European waters (Division 6, comprising two oil-burning and one coal-burning dreadnaughts, had then recently arrived at Berehaven for duty in connection with the battle cruiser raid plan) and divisions 7 and 8, which were in the United States. Due to various difficulties, however, in getting a complete arrangement by cable, with the Admiralty on one side and the Navy Department on the other, no definite arrangements had yet been made at the time of the armistice, four months after the plan had first been proposed by the department.

I will insert in the record without reading some of the cables and letters bearing on this subject to show the difficulties attaching to an apparently simple matter.

There are a great many similar cases that could be cited.

2489. In order to carry out the desires of commander Division 9 as approved by you of sending one ship of that division home at regular intervals for overhauling and at same time keeping up the strength of Division 9 and Division 6 to this present quota, department suggests following plan for consideration: At stated intervals replace one of the ships of Division 9 in rotation by one of the ships of Division 6, upon reporting of ship from Division 6 to commander Division 9 detach one ship of Division 9 to sail for home. One dreadnaught of battleship force 2 will sail to replace ship in Division 6. 1102. 2489.

BENSON.

[Secret.]

OCTOBER 15, 1918.

From: Force commander.
To: Secretary of the Admiralty.
Subject: United States battleships in European waters.

1. In order to provide so far as possible for making repairs in the United States to United States battleships detailed for service in European waters and for the further purpose of affording to officers and men opportunities for leave at home, the Navy Department has proposed the following plan for rotation of vessels composing battleship Division 9 (sixth battle squadron, Grand Fleet) and battleship Division 6 now stationed at Berehaven, Ireland, as a raider guard.

2. It is proposed that on a given date one ship of Division 6 sail for the north to join Division 9 and upon her reporting one of the ships of Division 9 shall sail for the United States.

On the date upon which the vessel sails from Division 9 for the United States, an additional battleship shall sail from the United States to join Division 6.

The department has not stated how frequently such a change would be made, but it is probable that allowing 10 days for the voyage each way across the Atlantic one month overhaul period, and 10 days for contingencies, the cycle would be two months.

Digitized by Google

3. This plan has been pronounced satisfactory by the commanders of both battleship divisions concerned and the commander battleship Division 9 has stated that the commander in chief, Grand Fleet, is in accord with the policy involved. The admiralty's views in the premises are requested.

4. The principal particulars of the vessels involved are as follows:

Name.	Fuel.	Battery.
Now with Division 9:		
Texas	Coal	10 14-inch.
New York	do	Do.
Wyoming	do	12 12-inch.
Florida	do	10 12-inch.
Arkansas	do	12 12-inch.
Now with Division 6:		
Utah	do	10 12-inch.
Nevada	Oil	10 14-inch.
Oklahoma	do	Do.
In United States:		
North Dakota	Coal	10 12-inch.
Delaware	do	Do.
Arizona	Oil	12 14-inch.
Mississippi	do	Do.
New Mexico	do	Do.
Pennsylvania	do	Do.

5. If the Admiralty sees no objection to the proposal in principal, the details can doubtless be arranged. It seems important that so long as a raider guard is maintained at Berehaven there should be at least two oil-burning vessels there, in order to facilitate refueling should the vessels return from a trip and be obliged to proceed immediately to sea on another trip.

6. It would also be the endeavor always to replace a 14-inch gun ship in the Grand Fleet by a 14-inch gun ship, so as not to reduce the battery strength of the United States division.

7. As docking arrangements have already been made for the vessels with the Grand Fleet covering a period from October 21 to January 31, these arrangements would have to be altered in case the policy herein set forth is inaugurated, but this can doubtless be arranged without serious dislocation of plans for British vessels.

WM. S. SIMS.

[Secret.]

OCTOBER 27, 1918.

Simandus.

3923. From Opnav. For Admiral Benson. Recommend battleship assignment to divisions be changed as follows:

November 15: U. S. S. *Arizona*, 8 to 6.
December 1: U. S. S. *Nevada*, 6 to 9.
December 10: U. S. S. *Wyoming*, 9 to 7, and U. S. S. *North Dakota*, 7 to 6.
March 1: U. S. S. *Oklahoma*, 6 to 9.
March 10: U. S. S. *Florida*, 9 to 8, and U. S. S. *Mississippi*, 8 to 6.
June 1: U. S. S. *Utah*, 6 to 9.
June 10: U. S. S. *Texas*, 9 to 8, and U. S. S. *New Mexico*, 8 to 6.
September 1: U. S. S. *North Dakota*, 6 to 9.
September 10: U. S. S. *Arkansas*, 9 to 7, and U. S. S. *Idaho*, 7 to 6.

Foregoing changes will greatly benefit personnel and return to home ports vessels that require overhauling. 13126. 3923.

BENSON.

OCTOBER 27, 1918.

AMNAVPAR, *Paris:*

For Admiral Benson. With reference to Opnav. 3923 retransmitted to you from Washington. The proposal made some time ago by the department for rotation of ships between battleship Division 6 and 9 is now under consideration by Admiralty and commander in chief, Grand Fleet, as to its effect upon Grand Fleet and as to whether oil burning or coal burning ships should be used in Division 9. Recommend final decision on this matter be deferred until Admiralty's ideas have been made known, which should be soon.

SIMS.

The CHAIRMAN. Admiral Sims, it is almost 12 o'clock, and if that is a good place for you to stop, I think we had better suspend here.

Admiral SIMS. Very well.

Senator PITTMAN. Mr. Chairman, for the record, just before we adjourn: I have been necessarily absent from two or three hearings of this committee, and so that it may not appear that there was any discourtesy to the chairman, or neglect of my duty on this committee, I want to state that I have been attending hearings of the Foreign Relations Committee in a matter which was of considerable importance, and in view of the fact that we had agreed that the direct testimony here should be put in first without any interruptions, and it appearing that the direct testimony of Admiral Sims was all prepared in advance, I felt that I could be spared better from the subcommittee here than I could from the Foreign Relations Committee, at that time. I think that the various matters we have had under consideration in the Foreign Relations Committee are now terminated, and if that is so, I expect to be in more active attendance at these hearings. I have been reading these hearings at night, and while I would have liked to have had an advance copy of this, because I could possibly have gone ahead faster, there are a great many questions that have suggested themselves to me which undoubtedly Admiral Sims can clear my mind on, and I assume that it will take to-morrow to complete the Admiral's testimony, at least.

Admiral SIMS. There will be only 10 or 15 pages more to-morrow, and I can finish them in about an hour or an hour and a quarter, or something like that.

Senator PITTMAN. I would like to ask, then, that when the direct testimony is through to-morrow, we adjourn until the next day, by reason of the probability that to-day and to-morrow the most important phases of this treaty matter will be disposed of.

The CHAIRMAN. That is, after the hearing to-morrow it is suggested that we adjourn until Friday?

Senator PITTMAN. Yes.

Admiral SIMS. That is only giving up half an hour, then?

Senator PITTMAN. Yes.

The CHAIRMAN. The committee will adjourn now until to-morrow morning.

(Thereupon, at 11.50 o'clock a. m., the subcommittee adjourned until to-morrow, Thursday, March 18, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

THURSDAY, MARCH 18, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, and Trammell.

TESTIMONY OF ADMIRAL WILLIAM S. SIMS—Resumed.

Admiral SIMS. When I concluded my testimony yesterday we were considering the subject of the negotiations that were being carried on between the Navy Department and the Admiralty and the headquarters abroad, with reference to the rotation of battleships, so that our ships could come home for docking and recreation. Continuing from thereon, I have cited these cases at this time in order to show the delay and confusion caused by the department's failure to send me adequate assistance, and to maintain a sound military policy with regard to the command and administration of the overseas forces.

Of course, when the officers were sent over for a planning section, many of the early difficulties disappeared. This planning section proved to be of great value to the allied cause. The allied naval council was formally organized in December, 1917, and held its first meeting in January, 1918. I was detailed by the department by cable as the American representative in this council, and in the great and increasing volume of work which arose in connection with the consideration of many plans for fuller cooperation between the Allies, and for carrying out new operations, the services of this planning section were of the utmost importance.

In pointing out to the department how easily operation could be coordinated by the use of such a staff, in a letter of January 21, 1918, to the department I said:

> As a result of the activities of the planning section, all questions concerning the northern barrage which required prompt settlement have been taken up for discussion and, with one or two exceptions, have been settled. * * * In my dealings with the Admiralty in this matter of the northern barrage, I found that Admiral Wemyss is very desirous of having his subordinates handle all matters of details, bringing to him only completed solution of all problems presented, rather than to depend upon him for a solution. I believe that the entrance of our planning section into the Admiralty will have a good effect in this respect.

Among other things this planning section drew up a study of the fundamental naval problems of the war, which was transmitted to the allied naval council. As I stated in my letter of February 22 to the department, No. 9489, "this was one of the first problems

Digitized by Google

I requested the planning section to take up after it was organized, as I am of the opinion that at no time in the past has sufficient thought been given by the several admiralties to the general naval situation and to the relations that must exist between the maritime and land strategy of the war."

In a letter of August 15, 1917, I discussed the services rendered by this planning section in the following paragraph:

AUGUST 16, 1918.

The planning section which was formed in December, 1917, has been of the utmost service to the force commander through its studies of important political, strategic, and tactical questions, upon which it has submitted memoranda of great value, not only as meeting existing situations but as forming matter of permanent value in connection with future operations.

Many of the suggestions and recommendations made by the planning section have been adopted, and much of the material prepared by it has been promulgated to the forces in Europe for their information and guidance.

The influence of the planning section upon the British Admiralty has been noticeable as affecting the methods of work of the plans division of the Admiralty and affecting the opinions of the Admiralty naval staff. Planning section memoranda No. 40, which contained some recommendations capable of being construed as critical of Admiralty methods and performances, was given by me unofficially to one of the members of the naval staff, who I felt sure would take it as it was meant, that is, as a study of the situation from the German point of view and in no sense a criticism of the Admiralty. Not only was this paper highly thought of by the officer in question, but it has been most favorably commented upon by the first sea lord, who has directed that a copy be sent to the commander in chief, grand fleet.

This is a good example of how constructive criticism should be received.

Great as has been the benefit to the force commander of the work of the planning section, I am disposed to believe that its chief value has been in its tendency to establish mutual understanding as to methods of thought on military questions as between ourselves and the admiralty.

The number of problems that were studied, and the solutions which were proposed, undoubtedly had a profound effect upon the general agreements and coordination of activities between the various allies. It should be borne in mind, however, that this planning section did not begin its work until the first week in January, 1918, nine months after we entered the war, although I had recommended such action in May, 1917, eight months previously. Consequently, effective as was its work after it was established, much valuable time was lost in those early critical months, because there was not available in London such a group of our experienced and highly efficient officers, familiar with the major lessons of naval warfare, to assist in planning our activities and coordinating them fully with those of the various allies.

DEPARTMENT REFUSED TO PERMIT ENROLLMENT OF AMERICANS IN NAVAL RESERVE.

In my letter of January 7, 1920, which is the basis of the testimony that I am presenting, I also pointed out in paragraphs 70, 71, 72, and 73, that during the first year of the war the department refused to permit me to enroll in the Naval Reserve capable Americans who had special knowledge and who offered their services; that the department refused to trust to my discretion any promotion of these officers, thereby doing a serious injustice to the men themselves, by failing to recognize really distinguished service; and also occasioning me great embarrassment.

Digitized by Google

These officers perform important services, and were frequently of an age and experience much greater than their rank indicated, and were dealing with allied officers of much higher rank. Practically from the time of my arrival abroad, I recommended to the department that I be authorized to enroll in the Naval Reserve for work in my command suitable Americans who were at the time abroad. Many of these Americans, because of years of residence in Europe, and familiarty with European customs and languages and personalities, were in a position to render the greatest service to our naval forces in Europe, especially in positions on shore, which required no technical knowledge of naval duties but required exactly those qualifications which these men possessed preeminently, and which it would be extremely difficult to find among the naval reserve officers being enrolled in the United States.

In April, Lieut. Gillmore, an ex-naval officer of wide European experience in dealing with European admiralties in connection with naval appliances, voluntered his services, and on April 14 the Secretary of the Navy authorized his provisional appointment as a lieutenant in the naval reserve. Lieut. Gillmore provided me personally with office force, and equipment, including typewriter and paper and pencils, and himself paid the salaries of the stenographers during those early critical days of my activities, as the authority for such expenditure had not been granted by the Navy Department. Lieut. Gillmore was the only reserve officer whom the Navy Department authorized me to enroll during the first year of thr war.

On May 7, 1917, the naval attaché requested authority to enroll another American to handle the confidential work in his office.

On May 9, I cabled requesting "general authority to enroll simir lar qualified candidates for naval reserve force as may be useful fo- my command, notifying department in each case."

On May 18, the naval attaché received a cable stating:

Received May 18. Naval attaché.

It is the opinon of the Navy Department and particularly that of the chief of Naval Operations that the services of patriotic Americans abroad can be used to the best advantage by employing them, and it is considered that employing them is preferable to giving them commissions in the Naval Service.

NAVINTEL.

On May 14, in a cable to the department I requested information concerning the department's action on "my request for authority to enroll qualified candidates in the naval reserve. The services of these officers are urgently needed both for staff work here and in France and as relief for officers afloat."

On May 19 the Secretary of the Navy informed me:

The department does not authorize enrollment in the naval reserve at present.

And again in a cable received June 5, the Sercretary stated:

The department disapproves of all enrollment of commissioned personnel. You have authority to employ necessary clerical assistance.

As, however, these assistants were, by the nature of the situation, intended to handle most secret communications and matters, which, by Navy regulations, can not pass out of the hands of commissioned officers, it was practically essential, if my work was to continue, without great embarrassment, that reserve officers should be enrolled to handle this class of work.

Digitized by Google

The idea of having enrolled officers is that as soon as a man is enrolled in the Navy he comes under naval regulations, and is subject to disciplinary measures, can be court-martialed for offenses, and is therefore under more efficient control and distinct authority.

In July and August, as the work rapidly increased, a number of young Americans volunteered their services and came in to help me. Five of them took up work immediately, handling codes and doing the necessary communication work. Another was practically put in charge of the secretarial work.

In a cable of August 12, 1917, I referred to this fact and requested authority to enroll six men in the naval reserve, stating:

> Unless this is done, the services of most of these men will be lost to me, as they naturally do not wish to go through the war as civilian appointees, and need not do so, as one or two of them already have opportunities for obtaining commissions in American Army in Europe.

Two days later I received a dispatch in reply stating:

> Necessary steps have been taken. Armed guard officer will inform you upon arrival.

There was no other information but that "necessary steps have been taken. Armed guard officer will inform you upon arrival."

At the time this cryptic message was not understood, but when the armed guard officer arrived 10 days later it was found that he had brought with him the necessary forms for the enrollment of 12 reserve officers and the necessary authority from the Bureau of Navigation. Immediately upon receiving this authority eight men were enrolled in the naval reserve in London, and later one additional man was enrolled in London and three in Paris, all being employed on work in the Paris or London headquarters, and thereby making it unnecessary to employ regular line officers so badly needed for other duties. Repeatedly throughout the following year I requested authority to enroll further officers in the reserve as the requirements grew, but received no such authority until March, 1918, and then only for five officers.

PROMOTION OF OFFICERS.

Similarly with regard to the promotion of these reserve officers, no regular method of promoting officers in the naval reserve forces on duty in European waters was established until late in the war. In the meantime many of these officers, especially those naval coast defense in class 4, for whom no promotion could be made except by special recommendations, were rendering most valuable service in positions normally held by officers of higher rank. For many of them I considered it in the interests of the services that their work should be recognized and rewarded and that they be promoted not only for the sake of the morale of the service, but also as an actual help to me, because of the greater facility it would give them in their relations with Allied officers of higher rank with whom they were dealing. The situation was especially aggravated among the reserve personnel on duty abroad as they began to discover that many men with whom they had served in the United States and who had remained on duty in the United States in more or less routine posts were being regularly promoted, sometimes one grade, sometimes two, while for the arduous and important service in the war zone practi-

Digitized by Google

cally no promotions at all were being made at this period among reserve officers. For example, many aviation officers who rendered the most distinguished service in actual flying were recommended by me for promotion and these recommendations disapproved, although other men, who had remained at home, were promoted by the department, and finally when they came to Europe a few months later were superior in rank to the pilots who had had many months' experience and who had rendered most distinguished service in the war zone. This I pointed out in a letter of April 28, 1918, but no action was taken.

On August 29, 1918, I sent the following cable, concerning the matter, to Admiral Benson, but the action I recommended was not taken:

[Dispatch to be sent. Simben.]

Date: August 29, 1918.
To: Opnav, Washington.
Prepared by A-1.

Simben 33. Our letter A-1, 15766 of April 21, 1918, recommended Ensigns J. R. MacNamara and P. F. Ives, Reserve Force, for promotion to rank of lieutenant (junior grade), in recognition conspicuous service rendered. Ensign MacNamara was officially credited with having seriously damaged enemy submarine on March 21, and Ensign Ives with having made a successful attack against enemy submarine, but his bombs failed to explode due to no fault of his own. On June 8 our cable No. 9234 again recommended these two ensigns for promotion together with 16 other deserving cases. Of the 18 officers recommended the only one promoted was Lieut. (junior grade) C. F. Fuller, Reserve Force, attached to my headquarters to the exclusion of those officers recommended for gallant conduct in war zone.

Our cable No. 3741 of August 29 again recommended Ensign J. J. Schieffelen, Reserve Force, for promotion to lieutenant (junior grade) in recognition of his having seriously damage enemy submarine off east coast of England August 9.

In order to maintain esprit de corps and high standard of efficiency of U. S. Naval Forces, Foreign Service, urgently request that my recommendations for promotion due to gallant conduct in the face of the enemy be accorded prompt recognition. The arrival of officers holding the rank of lieutenant (junior grade), from the United States, senior to those ensigns mentioned above, can not fail to cause a spirit of dissatisfaction and discontent which will ultimately break down the excellent esprit de corps now existing. This is particularly true in the case of Ensigns Ives and MacNamara, who were recommended for promotion in recognition of their conduct in the face of the enemy over four months ago. 033730.

SIMS.

In a personal letter of August 30, 1918, to the Secretary of the Navy, I had pointed out to him also what injustices were being done by the failure to promote those brave and efficient officers in the reserve flying corps in the following letters. [Reading:]

Admiral Sims's personal file.

AUGUST 30, 1918.

MY DEAR MR. SECRETARY: I should like to invite your personal attention to a matter which, in my opinion, very intimately concerns the efficiency of one of the branches of the forces over here, namely, the Naval Aviation Service. The young men of this service are performing their duties in a manner of which the Navy Department should be very proud. They are risking their lives every time they make a flight. They are losing their lives at the rate of about one per day. They have received very high commendation from the Allies with whom they are serving.

In some respects they are the Allies' hope of the future in this service, as they come to their duties with the fresh enthusiasm of a country that has not been at war for a number of weary years as these people over here have been. It seems to me that when they perform conspicuous acts of gallantry they should be promptly rewarded by the Navy Department. Some such reward is necessary to keep up the admirable spirit they have at present. I am afraid that the treatment they are now receiving

Digitized by Google

can not but affect their morale. For the most part, they are carrying out their duties from isolated stations, and something is necessary to keep up their enthusiasm.

It is for this reason that I have recently recommended by cable certain officers of the rank of ensign for promotion to the grade of junior lieutenant.

I understand that it is a regulation or a policy of the department that all promotions shall be made only upon the recommendation of a certain board in Washington. I may be misinformed upon this subject, but the point I wish to make is this, that in order that these rewards should have the effect that I believe to be necessary, I think that upon the recommendations made from this side that these young men should be promoted without the slightest delay.

It would not be unprecedented at all, to entrust me with this power of promotion in the case of young men who perform these gallant actions. It certainly would not be unprecedented to trust my judgment in this matter and to immediately promote these officers upon my telegraphic recommendation. It seems to me that, in the interests of getting along with the war, an exception might be made in the case of the commander of the forces over on this side.

I beg you to believe that I do not make this recommendation with any other object than to increase the efficiency of our naval aviation forces.

I like to believe that you would have sufficient confidence in my judgment and integrity to be sure that a privilege of this kind would not be abused.

In my cable of August 29, 1918, I recommended Ensigns MacNamara and Ives of the reserve force for promotion to junior lieutenant, in recognition of the conspicuous service they have rendered. Both of these officers were officially credited with having seriously damaged an enemy submarine. Subsequently I again recommended these officers for promotion together with a number of other deserving cases. Of all of those recommended only one promoted to lieutenant (junior grade), namely, Ensign Fuller of the reserve force, who is attached to my headquarters. I also recommended Ensign Schieffelen for promotion in recognition of having seriously damaged a submarine off the east coast of England.

It is more particularly to be regretted that these officers are not promoted because of the fact that officers are arriving on this side holding the rank of lieutenant, and this of course can not fail to cause a great spirit of dissatisfaction and discontent and thus can not fail to lower the enthusiasm and the morale of these splendid young men who are doing such excellent war service.

Similarly, with regard to reserve officers who were doing important work in London and Paris, I repeatedly recommended their promotion. In the case of a number of officers in London headquarters, I recommended promotions on March 31 on their fitness reports. I cabled on July 15, requesting to know what action had been taken. Again, on July 17. I received no reply from the department until August, when I received letters of July 22 and August 2, which I will read. [Reading:]

N-32-R/CS. 871-172.

NAVY DEPARTMENT,
BUREAU OF NAVIGATION,
Washington, D. C., July 22, 1918.

To: Force commander, United States naval forces operating in European waters.
Subject: Promotion of officers recommended in reference (*a*).
Reference: (*a*) Cablegram to Bureau of Navigation No. 9622. (*b*) Cablegram to Bureau of Navigation No. 1335.

1. Receipt of the cablegram, references (*a*) and (*b*) recommending certain officers for promotion is acknowledged. The board for the assignment of higher provision rank to officers in the United States Naval Reserve Force has not had an opportunity to act on these recommendations.

2. The importance of assigning higher rank to office, deserving promotion is fully realized by the bureau, but owing to the immense amount of extra work in the bureau incidental to the war which has had to be accomplished by an untrained force, it is impossible to act upon such recommendations with the dispatch that is desirable.

3. As it is inevitable under present conditions that considerable time must elapse between the receipt of these recommendations and the day they can be acted upon, it is suggested that in the future such recommendations be made through the regular mail channels. It is also desirable that a separate letter be submitted on each officer

Digitized by Google

recommended for promotion. If separate letters are submitted the individual cases can then be acted upon without loss of time and with much more convenience to the bureau.

L. C. PALMER,
Rear Admiral, United States Navy;
Chief of Bureau.

In reply refer to No. 13J. N-10-ED-P. 31-9-1.

NAVY DEPARTMENT,
BUREAU OF NAVIGATION,
Washington, D. C., August 2, 1918.

To: Force commander, commanding United States naval forces, operating in European waters.
Subject: Promotion of officers, reserve force, class 4.

1. Promotion of officers in classes 1 and 2 of the Naval Reserve Force is provided for automatically by assigning to such officers running mates of the Regular Navy. It is the bureau's desire to have as many officers of class 4 qualify for duties in class 2 as is possible and to transfer such officers to that class, whereupon they will be assigned running mates and attain their promotion automatically.

2. The bureau will allow certain promotion of class 4 officers, subject to the following restrictions: Ensigns who have attained the age of 24 years, performing shore duty only may be promoted to the rank of lieutenant (j. g.) after 12 months active duty as commissioned officers. Ensigns doing duty afloat should be required to qualify for duties in class 2 and be transferred to that class. The length of service required for such transfer will depend only upon the officer's ability to attain the qualification, but not sooner than three months' duty afloat. No promotions will be made above the rank of lieutenant (j. g.) until officers have qualified for duties afloat and been transferred to class 2.

3. The bureau reserves to itself the right to promote or not to promote in any individual case, depending upon the ability of the officer concerned, dependent upon his record.

L. C. PALMER,
Rear Admiral United States Navy,
Chief of Bureau.

I finally was informed by the department that before any promotions could be made complete fitness reports must be submitted, and that in any case the bureau would have to be furnished evidence of faithful service and of qualifications for promotion before such promotion could be made. It was not until after the armistice that I received authority to make the promotions which I had been recommending in many cases for nearly a year, and then only a certain number of those I recommended were authorized.

Early in September, 1918, an officer who had recently been on duty in the Bureau of Navigation was available for temporary duty at the London headquarters. This officer had been ordered to Europe for duty in the forces, but with instructions to make a study of the personnel situation in the forces and to submit a report thereon to the Bureau of Navigation before reporting to me for such duty as I might assign. In the course of his studies he visited all of the stations occupied by us in the British Isles and many of those in France, and thus acquired a very intimate knowledge of the situation and of the conditions under which the forces were operating.

After he had completed his study and submitted his report, I directed him to make a particular study of the subject of reserve officers, and prepare for me, for submittal to the department, a letter on "Policies with regard to promotion of United States Naval Reserve Force officer personnel serving in the war zone." His report was submitted under date of September 11, 1918, and he handed it to me with the remark that before beginning his work, he had been of the opinion that promotions should not be made by me, but should

Digitized by Google

be made in accordance with the policy set forth in the Bureau of Navigation's letter of August 2, 1918, which I have just read and in which the bureau stated that it reserved to itself "The right to promote or not to promote in any individual case, dependent upon the ability of the officer concerned, dependent upon his record," but that in the course of his investigations he had entirely changed his mind and was convinced that it was essential that the power to promote should be placed in my hands, and that he had therefore been able to prepare a letter recommending that policy.

This incident illustrates perfectly the fact that, generally speaking, sounder decisions can be reached by those living in the atmosphere of the war zone than those who are far removed therefrom. In other words, it is safest to entrust to the commander in the field all possible discretion and all powers which can legally be so entrusted, and to repose trust in him rather than to attempt to control his actions from a headquarters far removed from the scene of his activities.

This letter is entirely too long to read, but I will insert it in full in the record and will merely state, for the present information of the committee, that it recognized fully the difficulties with which the Bureau of Navigation and the Navy Department had been confronted in administering the Naval Reserve Force, and expressed concurrence in nearly all of the rules and policies laid down by the Bureau of Navigation, governing the appointment and promotion of officers in the reserve force, pointing out, however, how in some particulars these rules and policies operated to the disadvantage of officers serving abroad as compared with those serving at home. The letter includes certain specific recommendations regarding the placing in the hands of the commander of the European forces the appointment, promotion, and demotion of reserves officers, the policies of the bureau being strictly followed. The letter referred to is as follows:

SEPTEMBER 11, 1918.

From: Force commander.
To: Secretary of the Navy (Bureau of Navigation).
Subject: Policies with regard to the promotion of U. S. N. R. F. officer-personnel serving in the war zone.

1. A careful study and analysis of all the letters, instructions, circulars, and orders issued since the inception of the Naval Reserve Force, with particular regard to the appointment, classification, precedence, and promotion of officers, has been made by the force commander. It is noted that the bureau has repeatedly invited comment and recommendations; this letter contains certain comment, conclusions, and recommendations based on giving due regard in every case to the following considerations:

(*a*) A vigorous prosecution of the war.
(*b*) Fairness and justice to the personnel.
(*c*) The present necessary policies with regard to naval personnel as a whole.
(*d*) The naval personnel situation after the war.

2. The force commander has been greatly impressed by the magnitude of the bureau's task, the farsightedness that is in evidence throughout the policies, the painstaking efforts to achieve fairness to all, and the consistent effort to build up a reserve force with seagoing qualifications. The bureau's very obvious objectives are thoroughly appreciated.

3. While the force commander is concerned first of all with the vigorous prosecution of the war by the forces under his command, he desires to emphasize the fact that so far as the recommendations contained in this letter are concerned, he has given careful thought in such case to the possibility that the policy which, at the moment, may best serve military ends, may be detrimental to best serving them later on. The future as well as the present is, therefore, carefully taken into account. The bureau's viewpoint as well as the European forces' viewpoint is considered. The bureau's relation to influence and authority entirely beyond its control is considered.

4. Such parts of the act of 29th August, 1916, as established the reserve forces were couched in extremely general terms, so that all provisions admitted of great flexibility and latitude in the instructions for the administration and organization of the force. The general order promulgating the establishment of the reserve force virtually gave a free hand to the Bureau of Navigation in all matters. The organization, in order that it might fit the practical requirements and the needs of the service, has undergone an extensive evolution, so that the various classes in effect to-day are not those in effect immediately after the passage of the act which created the reserve force. It has been necessary to carry out a continuous reconstruction of policies. The policies of January, 1917, were widely different from the policies of January, 1918. This has been necessary because the bureau has had to meet changing conditions. The reserve force had to be organized quickly, for the personnel was needed. The bureau decentralized its authority, and naturally turned to the naval districts. The districts produced the personnel and gave it initial training; the bureau gave certain personnel more training; the forces afloat gave, and are giving, further practical training; and the redistribution of the trained personnel is taking place continuously according to the needs for their services. The success has been great, and has been due to the splendid cooperation between the Bureau of Navigation and the forces on shore and afloat.

5. It has been necessary to change the policies to meet the changing conditions; the conditions as they pertain to the naval districts and to vessels in home waters are not the same as those pertaining to the forces operating against the enemy. The bureau has taken the second named conditions into consideration, but it is the opinion of the force commander that some variation from the general policy is necessary to fit the conditions at the front. Decentralization has extended, generally speaking, only to the naval districts, and to the supervisors representing the bureau. Meanwhile, the forces in Europe have increased to a point where both in officers and men they number more than the personnel of the entire Navy immediately prior to the war.

6. There are now attached to the forces operating in European waters approximately 3,700 officers and 55,000 men. These figures include none of the trans-Atlantic transports, but include only the personnel under the commander of the United States naval forces operating in European waters. Six months hence, the personnel will very probably have increased 50 per cent. Of the total number of officers, approximately 1,800 are U. S. N. R. F. The remaining 1,900 are regulars and temporary officers.

7. The act of July 1, 1918, absorbed the National Naval Volunteers into the newly legalized class 2, and fixed precedence, stating however, "That during the present emergency the date of precedence of all officers of the Naval Reserve Force shall be as prescribed by the Secretary of the Navy." This authority may, of course, be delegated by him to others and rigid rules are not mandatory. The bill further specifies how promotions of reserve officers shall be effected; the force commander has received an advance copy of the bureau's memorandum of July 22, 1918 drawn up pursuant to this act

8. The memorandum mentioned in the preceding paragraph, and such parts of the previous instructions, etc., as are still in effect are assumed to include all the policie now in operation pertaining to Naval Reserve officer-personnel.

9. The comments which follow will relate to the various classes of reserve officer personnel, and to reserve officers-personnel in general.

10. *Class 1 officers.*—The rules and policies regarding the precedence and promotion of officers of this class are considered to fit the conditions in the forces in Europe excellently.

11. *Class 2 officers.*—The rules and policies regarding the precedence and promotion of such officers of this class as were National Naval Volunteers are considered to fit the conditions in the forces of Europe excellently.

12. As regards officers in class 4 for 1, who, it is stated, will be transferred to class 2, the rules state: "Will have the precedence from the date of their designation as class 4 for 1"; and, as regarding all class 2 officers—"at the time an officer (line or staff) is appointed in, given a provisional rank in, or transferred to class 2, his running mate in the Navy will be the officer who is at the bottom of that rank and grade, and promotion will follow as outlined under (1) (*d*)."

These two rules are apparently at variance. There will be numerous cases in which officers whose dates of designation as class 4 for 1, and of transfer to class 2 will be separated by considerable periods of time.

In other words, all administrative delay will operate against the officer, and therefore the farther away from the adminsitrative center the officer is, the lower down the list will his ultimate running mate be found. The officer in Chesapeake Bay will have considerable advantage over the officer in the North Sea. Furthermore, any class

Digitized by Google

4 for-general-service officer who has been doing duty on shore in the war zone will receive no credit for this service when finally designated as class 4 for 1, and transferred to class 2, as the precedence and promotion rules do not take into account any of this class 4 for general-service employment. This will be decidedly discouraging to a number of officers who have been performing excellent service in various parts of this station, frequently in hazardous billets. It is considered that some differentiation should be made between the employment on shore of class 4 for-general-service officers in the United States, and those on shore duty with the fighting forces. The conditions are entirely different, and the duties differ widely. It is not maintained that their service is more arduous or more important, but it is more trying in every way, and they feel that it is more intimately connected with fighting the enemy.

13. *Class 3 officers.*—The rules and policies regarding the promotion of officers of this class are considered to fit the conditions in the forces in Europe excellently.

14. *Class 4 officers.*—The rules and policies for precedence of class 4 officers are considered entirely satisfactory. There is no necessity for their having military authority outside of their own special assignment to duty, and the rules state they shall have none. Attention has been invited in paragraph 11 to the fact that the rules for precedence and promotion for class 2 officers who have been transferred from class 4 for 1 are apparently at variance, and to the fact that no account is taken of the service performed by the class 4 for 1 officer during the time that he was a straight class 4 officer. The class 4 officer takes precedence from the date of nis provisional assignment or rank.

Let it be assumed that an ensign, class 4 (general service) was given his provisional rank May 1, 1917. (There are many ensigns on this station who were appointed at approximately that time. His date of precedence is then May 1, 1917. On September 1, 1918, it has been found possible to release him from duty at Dunkirk, and send him to sea for training to qualify for class 4 for 1. He immediately ranks below all ensigns in the Navy and all ensigns of class 1 and class 2. His precedence drops lower and lower during his period of training, so far as it concerns officers of the other three classes just mentioned. By January 1, 1919, it is decided to recommend that he be designated as class 4 for 1. The recommendation is forwarded to the bureau, and, while he is awaiting action on this recommendation, his precedence continues to fall lower. After two months, he receives notice that he has been designated as class 4 for 1 and his transfer to class 2 follows. He now takes precedence from the date of his transfer to class 2. Thus after nearly two years' service in Europe he finds himself below all ensigns of the Navy and all class 1 and class 2 officers. His original date of precedence has fallen two years, because he has not had the good fortune to have been at home where he could be trained and made an ensign (T), or to have been sent afloat for training. His duty on shore in Europe has been necessary to the carrying on of active operations, and the force commander could not release him without loss to the effectiveness of the prosecution of the war. The two years this ensign did duty before at last finding himself at the foot of the class 2 list of ensigns, and junior to all ensigns in the Navy have given him no official recognition whatsoever; the only advantages are those of having added to his experience by doing work in a field of naval activity that was, unfortunately for him, not at sea.

15. Not let it be assumed that an effort was made to promote this ensign, while he was still ashore, and serving as a class 4 for-general-service ensign. For a long time the only rules that applied to such a case are those found on page 12 (4) (*a*) of the Regulations Governing the Organization and Administration of the Naval Reserve Force, 1917 (issued in May, 1918). Prior to receipt of these regulations there were numerous circulars, etc. bearing on the subject. It should be noted that in none of these instructions has mention ever been made of the numerous bases in Europe from which forces operate against the enemy. Naturally enough, the bureau's principal thought was of the naval districts and other shore establishments which were and are the sources of supply of new personnel to meet the ever-increasing demands for officers. To date not a single letter from the bureau pertaining to policies regarding officers of the United States Navy Reserve Forces has mentioned personnel doing duty at the numerous active basis on the front line. What then is the policy applying to the class 4 officer in Europe? In the absence of any mention of this particular personnel, it may be assumed that the rules relating to class 4 officers in naval districts should apply, but no notice to that effect has ever been given. The conditions in a naval district and those in a base in Europe, from which operations are conducted against the enemy, are by no means analogous. All forces are told to make their recommendations in the fitness reports on the officers whom it is proposed to recommend. Some of the class 4 officers were promoted, but the greater number recommended were not. The officers recommended expected to hear the results of their recommendations for promotion. Only those who were promoted, after considerable delay, received any notice

Digitized by Google

whatsoever. The force commander resorted to the use of the cable, and was requested to take up the matter of recommending officers for promotion, by letter only, and has lately been informed that individual letters in each case are desired.

16. The force commander does not desire that the preceding paragraph be considered in any way as an adverse criticism of the bureau. He feels that the bureau has done the very best that could have been done under all the circumstances, but the condition of affairs has not been conducive to the betterment of the morale of the class 4 officers in Europe, as may well be imagined.

17. At about the same time the pamphlet of Regulations was received, the bureau's memorandum of May 25, 1918, was received. The latter qualifies the former extensively, and new policies are announced in it.

18. The memorandum of May 25, 1918, makes no mention of class 4 serving in Europe, and, as in the case of all previous announcements, is based absolutely on the naval district plan. Attention is invited to paragraph 5, which reads:

"Having in view the general policy outlined above, recommendations and suggestions regarding this complement are, however, requested, in order that any future change may be made uniformly in all districts."

If it is to be assumed that class 4 officers in Europe are to be promoted as such according to the naval district plan (and the force commander has never been so informed) how will complements be established in Europe? The bureau's policy, and rightfully, is based on mobilization organization. The bases in Europe are changing and there will be no United States naval bases and stations in Europe after the close of the war. If it is intended that the stations and bases in Europe be assigned class 4 complements, when will it be done, and how will it be done? If it is not intended to do this, what then is the existing policy with regard to class 4 officers in Europe?

19. If the bureau intends that class 4 officers in Europe be promoted to fill vacancies in complement, it will find such a plan to be absolutely impracticable. Shore complements in Europe can never be definitely and permanently established any more than can a complement for a line of trenches or an ammunition depot behind the lines. The base or station that is necessary and important to-day, may be unnecessary and unimportant next week, etc. The force commander alone will be able to estimate the necessary base and station complements essential from day to day to carry on the operations that are in hand. In May, 1917, the naval forces in Europe consisted of a few hundred officers and men, to-day there are 3,700 officers and 55,000 men.

20. It is, therefore, concluded that there is no policy in effect that is applicable to the promotion as such of class 4 officers in Europe, other than the bureau alone will decide which class 4 officers recommended for promotion shall be promoted, and which shall not.

21. *Class 5 officers.*—The bureau's pamphlet states (see p. 12, (5) (*a*)):

"The number of officers allowed in each rank in class 5 shall be established by the Bureau of Navigation, and higher ranks may be given to fill these vacancies as outlined in (4) (*a*)."

22. The bureau's memorandum of May 25, 1918, states that, "as there is no Naval Flying Corps at present, a class 5 reservist can not be assigned a running mate in this corps. During the present war, aviation duties will be performed almost entirely by reservists of class 5 and a complement in the various grades has been established. This complement will be modified from time to time," etc. The bureau's memorandum of July 22, 1918, as far as it pertains to class 5 officers, is precisely the same as the memorandum of May 25, 1918. It is safe to assure, then, that the actual effect upon the policies relative to this class of officers by the act of July 1, 1918, consists only in extending the provisions of promotion by selection to officers of and above the rank of lieutenant commander, as these provisions apply to the whole reserve force.

23. There have been class 5 officers in Europe since May, 1917. The number is now 751. In the early part of 1919, the number will be about 2,000, provided the casualties do not become greater than has been anticipated. Up to the present time, no announcement as to the quotas in the various grades to make up the class 5 complement has now been received. Neither has any information been received as to the basis upon which the complement will be established. A policy has been announced, but the terms upon which it is to be operated in order to be in effect, as a policy, have not been made known. Therefore, so far as the force commander and the class 5 officers in Europe are aware, there is not yet any policy in operation, other than that the bureau alone will decide which class 5 officers recommended for promotion shall be promoted, and which shall not. To date, the class 5 officers in Europe represent the largest proportion of any class of reserves who are actually fighting the enemy. Furthermore, the casualties, in battle, sustained by this class of officers are greater than the combined casualties of the Navy and all other classes of reserve officers.

Digitized by Google

The casualties will become greater and greater as the northern bombing group gets into full fighting strength, and as the seaplane stations get into full operation. The average operating life of an officer pilot in Europe is three months.

24. Had the gallant work of the class 5 officers, who (unfortunately for purposes of publicity) have been compelled to fly foreign-made planes, received the wide notice that it deserves, it is felt that the subject of their promotion would naturally have received proportionately more prompt and serious consideration.

25. Page 12 (3) of the bureau's pamphlet states: "Officers in class 3 may be promoted in accordance with the position they held on a merchant ship or naval auxiliary (table Art. 207)." This excellent rule, by which promotion is governed by the position which the officer holds in the organization of which he is a part, should be applied as far as possible to class 5 officers—personnel in Europe, but applied within reason, of course. A ship requires an organization. The bureau would never assign a captain with the rank of ensign, and nine other ensigns, as the officer complement of a 10,000-ton transport. Yet there are fighting organizations of class 5 personnel in Europe of which the head and all his officers are ensigns. These numerous anomalies in the naval flying forces in Europe are not conducive to high morale, good organization, discipline or fighting efficiency. The splendid work of class 5 officers has been due to their universally high intelligence, keenness, interest in their work, and their courage. Meanwhile, on account of their relatively low rank, the naval service, of which they are a part, is subjected continuously to embarrassment and humiliation. There are many ensigns who have been fighting the enemy in positions that are filled by captains and majors in the various allied air forces in conjunction with whom they are fighting. Flying organizations—both tactical and administrative—are instituted in precisely the same manner as are military fighting organizations. The platoon, the company, and the battalion each has its counterpart in the flying services. A thoroughly established order of things exists in all the allied flying forces. They promote their officers precisely as the bureau promotes the class 3 officers "in accordance with the position they hold." They no more consider assigning a sublieutenant to a major's billet in the flying service than do they consider assigning a sublieutenant to command a battalion of infantry.

It would not be the part of wisdom to jump ensigns into the grades of lieutenant commander, even though they satisfactorily fill a fighting position which should entitle them to this rank. However, any system of promotion for class 5 officers in Europe that is not established along the same general lines as the class 3 system will be unsatisfactory and unsound. The bureau will apply the present excellent rule 3 to the 20,000 class 3 officers; it must provide in meeting the gigantic personnel demand involved in the Navy's operation of the various transports now building projected. A similar system should be applied, and immediately, to the promotion of class 3 officers in Europe.

26. From the present methods of promotion as applied to class 5 officers in Europe there have resulted many unreasonable and unfortunate situations. First of all, there has been invariably long delay in receiving the bureau's action on the recommendations. Some of the officers were, in the meanwhile killed, interned or captured. Among a number (18) of officers recommended in the past were Ensigns Ives and McNamara, both of whom had received letters of recommendation from the Secretary of the Navy for gallantry in action with the enemy. Up to September 3 but one of the 18 officers had received the promotion recommended. Unfortunately, this one officer was stationed at the Naval Headquarters, London. While it is a mere coincidence that this particular officer received his promotion, it is but natural that many class 5 officers ascribe his good fortune to the fact that he was on duty at headquarters. On September 4, following receipt of the force commander's dispatch on the subject, Ensigns Ives and McNamara and one other officer were promoted by the bureau's cable. The remaining 14 officers are as yet unpromoted. The promotion of Lieut. Fallon, during his presence in the United States, naturally created false impressions among a number of class 5 officers. Lieut. Fallon was recommended following distinguished conduct in action, for promotion to lieutenant (junior grade). He not only received his promotion to which recommended, but an additional promotion while in the United States. Meanwhile, his former fellow officers at the same station in England, who have been fighting the enemy during Lieut. Fallon's absence, have remained ensigns.

27. The beneficial and stimulating effect of the prompt recognition of meritorious or gallant conduct is lost if the promotion proposed as the recognition of demonstrated ability, courage, and fitness for higher rank, is delayed.

28. Numerous awkward situations have arisen due to the fact that newly arrived class 5 officers, with the rank of lieutenant (junior grade) must necessarily be sent out as second pilots with ensigns who have been in active service in Europe for some time.

Digitized by Google

29. *Reserve officers in general.*—The reserve officers in Europe have done little complaining; this is a very gratifying fact when it is considered that they are new to the naval service and are unaccustomed to the naval way of taking summary action on requests and recommendations. They have had much to discourage them, yet their morale has been high. It is the opinion of the force commander that it is incumbent on all concerned to give careful thought to the manner of dealing with reserve officers. They have not had the benefits of four years at the Naval Academy, and rightfully expect more of a human touch in informing them of what can be done for them and what can not. The force commander realizes the many difficulties in the bureau's way in its earnest endeavor to do the square thing by the reserve officers, and to secure their loyalty to the naval service. A great number of them are prominent and influential citizens, and it is encumbent upon all to insure a solid service loyalty on the part of these reserve officers. One of the best ways to accomplish this is to make them feel that their personal welfare is being intimately and carefully looked out for. The reservists in Europe have not the inspiriting example of patient, careful, and intimate administration of their personal affairs by the regular establishment that the regular establishment desires that they should have.

30. One of the most disheartening conditions, to the minds of the reserve officers, is the necessarily long delay involved in taking action on recommendations for their promotion. The many instructions regarding their appointment, classification, and promotion have, as may well be imagined, been most mystifying to the majority of the reservists. The numerous instructions have been necessary in order that the policies may fit the ever-changing conditions. As a result instructions are always forthcoming, the policy is never up to the minute, and by the time many instructions are received they are out of date, not applicable, or further instructions are announced as being in process of preparation to complete indefinite features, or to qualify other features of the current instructions. It takes approximately six weeks to two months to send a letter from most parts of this station to the department and receive a reply thereto.

31. The forces in Europe are on the front. Conditions on the front change rapidly. The personnel policies must meet the conditions and must meet them promptly. There is only one way that the details of policy can meet conditions on the front promptly, and that is by making the details of policy on the front, and carrying them out on the front. Policies based on the conditions of three months ago will not do for the conditions of the moment. Operation policies on the front must be up to the minute; so must the details of personnel policies. The Army has found it absolutely imperative to promote and demote where the fighting is going on, and the authority for this has been given. The Bureau of Navigation is just as desirous that the methods employed in carrying out the details pertaining to the promotion of reserve officers in Europe be improved as is the force commander. The following is an extract from the bureau letter of July 22, 1918:

"The importance of assigning higher rank to officers deserving promotion is fully realized by the bureau, but owing to the immense amount of extra work in the bureau incidental to the war which has had to be accomplished by an untrained force, it is impossible to act upon such recommendations with the dispatch that is desirable. As it is inevitable under present conditions that considerable time must elapse between the receipt of these recommendations and the day they can be acted upon, it is suggested that in future such recommendations be made through the regular mail channels."

32. It is considered important to mention that while it is undoubtedly not feasible to conduct examinations for confirmation during the continuance of the war, it is unfortunate that the confirmation of a number of class 1 officers was not deferred until the termination of the war, in order that the other classes of reserves might feel that all are being treated alike. It is not fair to the other classes of reserves to assume that all that they desire is the two months' retainer pay that goes with confirmation, for they have proven their unselfishness in too many ways to warrant that assumption. However, while this condition can not be altered now, it is important to note that it is a condition with which all reservists are familiar and one that inevitably appears to them as an example of discrimination although it is well known that discrimination was never intended. This is mentioned in order that the necessity for improving such conditions as do permit of improvement may be emphasized.

33. *Recommendations.*—After giving the entire subject mature consideration, and after giving due regard to the relations of the personnel situation to (*a*), (*b*), (*c*), and (*d*), as indicated in paragraph 1 of this letter, the following policies with regard to United States Naval Reserve Force officer-personnel in Europe are strongly recommended; and, furthermore, it is urged that they be put into effect at the earliest possible date:

Digitized by Google

(*a*) Upon receipt of the new Bureau of Navigation's circular with regard to appointment of reserve officers, appointment authority will be established in Europe, and appointments consummated in Europe, the instructions contained in the circular being followed exactly.

(*b*) Designation of reserve officers, as of class 4 for 1, and class 4 for 3 (as necessary from time to time) will be made in Europe, following the policies established by the Bureau of Navigation.

(*c*) The transfer of officers from class 4 to class 3, and from class 4 for 1 to class 2, and from class 3 to class 2 (as necessary from time to time) will be effected in Europe, following the policies established by the Bureau of Navigation.

(*d*) Appointment, promotion, and demotion of class 3 officers will be done in Europe, following the policies established by the Bureau of Navigation.

(*e*) Promotion and demotion of class 4 officers will be done in Europe, following the policies and the spirit of the Bureau of Navigation's instructions.

(*f*) The promotion and demotion of class 1 officers and of such class 2 officers as were formerly National Naval Volunteers will be done only by the Bureau of Navigation.

(*g*) The promotion and demotion of class 2 officers, except those who were transferred to this class from National Naval Volunteer status, will be done in Europe, following the policies established by the Bureau of Navigation.

(*h*) The promotion and demotion of class 5 officers will be done in Europe, following the spirit of the general policies with regard to reserve personnel, and upon a complement basis, the complements to be established in Europe and varied from time to time as necessary, to meet the operating policies of the fighting forces.

(*i*) The promotion authority established in Europe will not extend beyond the grade or rank of lieutenant commander, and promotion will always be made one grade or rank at a time. In the staff corps, in which a grade may include more than one rank, promotion will be made so that one rank only will be the amount of the advancement at any one time.

(*j*) Promotion will follow only in the cases in which all qualifications will have been unquestionably established, and the promotion authority in Europe will be used conservatively.

(*k*) Every effort will be made in Europe gradually to replace class 4 officers not serving afloat, by class 2 officers, and to send the class 4 officers—thus released—to sea for training and ultimate transfer when qualified, to class 2.

(*l*) The administration of all personnel affairs of class 3 officers will be carried out in Europe.

(*m*) The Bureau of Navigation will be promptly notified of the appointment, promotion, demotion, and transfers between classes, of all officers.

(NOTE.—The foregoing policiesr elate only to United States Naval Reserve Force personnel under the command of the commander, United States naval forces, Europe.)

34. There are no legal obstacles whatsoever in the way of the accomplishment of the foregoing proposed policies.

35. *Administrative machinery necessary to carrying out proposed policies.*—To carry out the foregoing proposed policies, the following would be necessary:

(*a*) Establish an appointment division in the personnel section of the United States naval headquarters in Europe.

The head of this division should be a lieutenant commander of either the Regular Navy or Naval Reserve, class 1. He should have had some legal experience, should be broad-minded, and should be tactful and patient in dealing with reserve officers. He should be satisfactory to the Bureau of Navigation.

NOTE.—The force commander nominates Lieut. Donald Craig, U. S. N. R. F. (class 1) for this duty. This officer is about to be advanced to the provisional grade of lieutenant commander.

(*b*) The head of the appointment division should have enrollment and recruiting authority, and should have authority to sign appointments, promotions, etc., for the Bureau of Navigation over the phrase "By direction." The same applies to one or more assistants in the division.

(*c*) He should keep in close touch with the Bureau of Navigation (for the force commander), and should also keep in continuous touch with all conditions on this station.

(*d*) All appointments, changes in classes, designations, etc., should be on forms identical with those used in the bureau.

(*e*) It is suggested that the bureau send an officer who has had experience in its reserve division (officers) for temporary duty at naval headquarters to assist in getting the appointment section in smooth running order.

(*f*) The bureau should be furnished a copy of every appointment, oath, and acceptance, designation, etc., accomplished by the office here, to insure that its records are complete.

Digitized by Google

(*g*) Assign to the staff of the flag officer commanding base 29 (Cardiff, Wales) an officer whose duty shall be the supervision of the personnel of the class 3 reserve on duty in European waters, his position and duties being analogous to those of a supervisor of naval auxiliary reserve.

(*h*) The force commander will establish a personnel board at his headquarters, and no promotions will be made except on the recommendation of this board, approved by the force commander. The officers on the board (with the exception of the head of the appointment division) will be of the Regular Navy.

(*i*) In the event of the bureau's approval of the policies and practice proposed in this letter no new policies will be initiated and put into effect without the bureau's advice and approval in each case.

35. The bureau's telegraphic approval of the policies proposed is requested in order that the force commander may proceed to carry out this plan at the earliest possible moment.

WM. S. SIMS.

I would like to say in connection with that subject that there was nothing at all personal in my request to be allowed either to enroll a certain number of reserve officers over there or to be allowed to promote within certain limitations.

In order to carry on business with an admiralty abroad and with a great number of business firms that we had to do business with, it was necessary to have men who knew the ropes, who were accustomed to that sort of thing, and the men referred to in my dispatches were American business men who had been doing business on the other side for years, who had personal associations with the people we wanted to get in contact with, and who could have been of the greatest possible use to us; say men of 40 or 45 years of age; men getting salaries from $10,000 to $20,000 and $25,000 a year, who were perfectly willing to come into the office and give us the benefit of their experience and advice, and to work for us. The Navy Department refused to allow these men to be enrolled, saying that we ought to employ them in a civil capacity. Well, a red-blooded American does not take to that sort of thing, and he simply promptly goes over to the American Army and gets enrolled there. He wants to wear the uniform and wants to it for his future, etc. That was all refused.

Now, as to the promotion of young reserves that we had over there, who were doing more fighting than any other of the American forces on the other side—naval forces—those were the aviation fellows; living in an outlying station, 20 miles from the nearest village, risking their lives every day, having a loss on the average of 1 to 1½ men a day. Those men were doing splendid stunts reported to us by the British, with whom they were associated. All I wanted was authority to make that man immediately a lieutenant. But it could not be done. That is an authority that is very commonly given to a commander in the field. It is called promotion on the field of battle. Not only was I refused permission to do it, but the people in Washington who had not been to the front at all, had not risked their lives or lost a man, were promoted and came out there with superior rank to these people that I wanted to promote.

Then another reason why I wanted to employ those very experienced Americans in London in the naval service was to get them into uniform, because that gives them a pass to all the activities of the Government, the admiralty, etc., that you could not expect to get for a man in civilian clothes.

TOTAL PERSONNEL IN EUROPE.

Before concluding these remarks on the question of the personnel provided me by the department for the administration of our forces and for the representation of our Navy Department with the Allies, I should like to invite your attention a moment to the actual number of officers that were on duty at different periods throughout the war, at the naval headquarters in Europe and in the European forces, and also to the amount of work that had to be accomplished. I have before me a table, which I will include in the record, which shows the approximate number of officers and men on duty in European waters at different periods during the war, together with a statement of the number of vessels and shore stations which were under my command in European waters at these periods.

Table I shows the number of personnel at naval headquarters on the first of each month during 1917 and at the beginning of each quarter during 1918. This table will show that, while late in the war the staff available became sufficient for handling the problems we had to face, the number was pitifully insufficient during the most critical period in the first half of the war, when it was vitally necessary that our preparations should be pushed with the utmost celerity, and that we should coordinate at once our activities with those of the Allies. This table will also show the long delays in making the weight of the United States Navy felt in the war because of the department's inaction in those early months so far as cooperating with the Allies was concerned.

Several tables produced by Admiral Sims are here printed as follows:

Officer personnel on duty at United States Naval Headquarters, London, England, Apr. 1, 1917–Nov. 11, 1918.

	Duty on staff.				Communication office and administration.				Total officers.	Enlisted men.
	(1)	(2)	(3)	(4)	(1)	(2)	(3)	(4)

[1] Office of naval attaché: 1 line officer; 1 pay officer; 1 medical officer.
[2] 2 armed guard officers on brief temporary duty.
[3] 1 armed guard officer on temporary duty.
[4] 1 armed guard officer on temporary duty.
[5] Naval attaché's office increased by 1 naval constructor, and 1 officer on special ordnance inspection duty.
[6] Increase due chiefly to transfer of aviation headquarters from Paris.

NOTE.—Following is explanation of meaning of figures in above columns: (1) Regular officers sent from United States by department for this duty; (2) reserve officers sent from United States by department for this duty; (3) regular officers ordered by Admiral Sims to this duty; (4) reserve officers enrolled in London or ordered by Admiral Sims from other forces for this duty.

Data not available for year 1918, but a small percentage of increases were ordered for specific staff duty.

TOTAL UNITED STATES NAVAL VESSELS IN EUROPE.

Table II shows month by month for 1917 the number of vessels that were available in European waters and the same information quarter by quarter for 1918. This table shows that our effective weight was not really thrown into the war so far as the Navy was concerned until well along in 1918. As I have already pointed out it was primarily either the department's failure to have our forces prepared when war began or the lack of whole-hearted cooperation with the Allies during the six or eight months of the war to which this delay must be attributed.

VOLUME OF CORRESPONDENCE CARRIED ON BY UNITED STATES NAVAL HEADQUARTERS IN EUROPE.

The rapid increase in the number of forces and in the amount of administrative work thereby involved can well be imagined, and I would submit for the record at this point a series of tables showing the growth in the volume of correspondence and cables handled daily and monthly during 1917 and 1918. It will be noted from this table that during the month of July, 1918, a total of 353 letters and 268 cables were sent and received from my headquarters. These numbers increased greatly in the succeeding months, and by the time of the armistice we were handling daily over a thousand individual pieces of correspondence. Thus in the month of September, 1918, alone, 11,500 cables passed through my headquarters. Nearly 8,000 letters were received and 7,000 letters sent, making over 30,000 communications that were handled during this one month.

GROWTH OF ADMINISTRATIVE WORK AT NAVAL HEADQUARTERS.

The following tables have been prepared in ordered to show the rate of growth of the number of correspondence and dispatches passing through Admiral Sims's headquarters.

The number of papers handled monthly has grown from an average of 700 per month in the second quarter of 1917 to an average of nearly 15,000 per month in the second quarter of 1918.

In July, 1917, an average of 22 letters and 24 dispatches were received or sent daily. Three months later these averages had grown to 60 in the case of letters and 65 in the case of dispatches, making a total of 125 papers handled daily. In January the daily business had grown to 151 letters and 131 cables, or a total of 283; in April the numbers were 224 letters and 203 cables handled daily, and in July 353 letters and 268 cables daily.

The accompanying graphs will illustrate the rate of growth by months and quarters. In the first nine months that Admiral Sims worked in Europe a total of 25,160 papers passed through the files. In July, 1918, alone 19,275 papers were received or sent, while there was on August 1 a total of approximately 125,000 papers in the files.

MEMORANDUM ON THE WORK OF THE FILES.

The following statistical data has been prepared to illustrate the work done by the central registry.

The first table shows the number of letters and cables handled by Vice Admiral Sims and his staff, month by month, from April, 1917.

The second table shows the average number of papers handled per day during each month.

The third table gives data concerning the methods used in filing papers.

ORGANIZATION OF EUROPEAN COMMAND.

As a further indication of the magnitude of the task imposed upon these headquarters in Europe, I will present for the record a chart showing the organization of the forces in European waters. Some idea of the complexity and wide variety of questions involved in the command of these forces can be gathered merely by a glance at this chart.

ORGANIZATION OF UNITED STATES NAVAL HEADQUARTERS IN EUROPE.

For the information of the committee, I will also present for the record at this point a copy of a memorandum which was drawn up in August, 1918, for the information of the Committee on Naval Affairs of the House of Representatives then making an inspection tour abroad, which explains the function of each section of the naval headquarters and covers the general operations of the forces under my command at that time

Digitized by Google

(The memorandum referred to is as follows:)

A BRIEF SUMMARY OF THE UNITED STATES NAVAL ACTIVITIES IN EUROPEAN WATERS, WITH OUTLINE OF THE ORGANIZATION OF ADMIRAL SIMS' HEADQUARTERS.

[Prepared by Intelligence Section of Admiral Sims' staff, August 3, 1918. Prepared for Naval Committee of Congress on tour of inspection abroad.]

GENERAL ORGANIZATION OF THE UNITED STATES NAVAL FORCES IN EUROPEAN WATERS.

Since the predominant naval effort in this war is British, due to the size and range of activities of the British Navy, and since the British Navy is controlled from the Admiralty in London, Admiral Sims selected London as the location of his headquarters for the purpose of directing the participation of the United States Navy in the naval campaign in European waters.

Since France is an invaded country, it is but natural that the predominant national interest of France is centered in its armies; as a result the French Navy has undoubtedly suffered, and has not been able to expand to any considerable degree during the war.

The naval attachés of Paris and Rome are the medium of communication between Admiral Sims and the ministries of marine in France and Italy, and they keep him in constant touch with the naval situation in these countries. The Admiral makes frequent trips to Paris and an occasional trip to Rome. Our naval attachés in Holland and Scandinavian countries keep Admiral Sims constantly in touch with all information they obtain.

There is direct telephonic communication between the British and French Admiralties, and in addition, the French Admiralty keeps an Admiral with a staff on duty in London, who cooperates with our staff.

The organization of the British Admiralty includes a highly efficient intelligence division, through which all important naval information is made available to Admiral Sims in all times. It is therefore unnecessary for Admiral Sims' organization to include a large staff for collecting information; it must and does include a small intelligence section for collating, digesting, and disseminating information.

It was at first proposed to establish Admiral Sims's headquarters in the British Admiralty, but on account of the congested condition of the Admiralty offices it was finally decided to establish the United States naval headquarters near the embassy.

Admiral Sims attends the daily conferences of the naval staff at the Admiralty, and in addition each officer of the Admiral's staff keeps in close touch with the corresponding division of the Admiralty.

In order to facilitate communications between the Admiralty and the United States naval headquarters and to establish a liaison service a British naval officer assigned to Admiral Sims's staff has an office at the Admiralty and a desk at Admiral Sims's headquarters; any division of the Admiralty desiring any information from or consultation with individual members of Admiral Sims's staff are enabled to do this through this officer. Similarly, officers of Admiral Sims's staff are enabled to quickly obtain information from the Admiralty.

Special telephone and telegraph wires have been installed between the Admiralty and the United States naval headquarters.

The Allied Naval Council, consisting of the representatives of France, Great Britain, Italy, Japan and the United States, meets frequently in London or Paris to discuss important questions concerning the naval campaign and particularly the disposition of forces.

The natural inclination of a naval service, which is a team by itself, is, of course, to operate together as a team. Admiral Sims believed from the beginning, however, that the only effective way to throw the weight of the United States Navy into the war without delay was to use its available units to strengthen the weak spots in the other navies, and thus effect a more vigorous conduct of the war already so thoroughly under way in all areas.

There would have been much wasted effort and time if any attempt had been made to take over any particular area and operate it entirely with United States Naval Forces. Hence, as the various naval forces have been rendered available by the Navy Department, the question of the best location for them has been discussed with the representatives of the other navies, and the disposition has been the result of common agreement.

Admiral Sims' headquarters may be considered the advanced headquarters of the Navy Department in the field. The Department deals only with Admiral Sims' headquarters, and Admiral Sims in turn directs and coordinates the work of all of the various groups under his general command.

Digitized by Google

All groups, wherever located, report regularly to Admiral Sims concerning their activities and operations, their condition as regards material, and supplies, their needs, and their plans, together with recommendations or suggestions for changes in plans or policies. Admiral Sims in turn keeps the Department informed by general reports of the activities of all the forces under his command. Daily matters of importance or of current interest are handled by telegraph or cable.

UNITED STATES NAVAL HEADQUARTERS—EUROPE.

In order to carry out the organization and meet the demands outlined above, Admiral Sims' headquarters is divided into various sections. The following is a list of these sections with very brief outlines of their functions.

1. *Chief of Staff.*—The Chief of Staff handles only important questions concerning plans and policies and disposition of forces, and renders decisions on questions affecting the various sections of the Staff.

2. *Planning Section.*—The Planning Section is composed of three Captains and a Lieutenant Colonel of the Marines, all of War College training, who have no administrative duties. It is their mission to keep themselves informed of the general situation, to carry on a constant study thereof, and to prepare and submit studies or plans covering proposed future operations or changes in present operations and methods, whenever in their opinion these are advisable.

Whenever new problems are encountered, the Planning Section is asked to make a comprehensive study of them before decisions are taken.

The Planning Section works in close cooperation with the corresponding Planning Section of the Operations Division of the British Admiralty.

In addition to making studies of problems and preparing plans for future operations, the Planning Section also fulfills the function of a critic of the organization and methods in effect in the forces.

3. *Operations Section.*—The Operations Section handles the convoying of all United States Navy and United States Army shipping, keeps track of the location of all United States Naval and merchant ships and, in close cooperation with the Admiralty, acts upon all cablegrams dealing with the routing of convoys and the assignment of escorts. The Operations Section prepares all orders to forces which affect their employment.

The Operations Section also has charge of the antisubmarine work and the operations of submarine chasers.

4. *Material Section.*—The Material Section keeps itself informed of the requirements of all forces as regards supplies of all description, including money, fuel oil, coal, food and clothing, and repair materials.

It also supervises all financial dealings with foreign Governments in connection with expenditures for the Navy. Arrangements have been made with the allied Governments by which our ships can put in to any of their naval bases and obtain urgent supplies just as if they belonged to the Navy of the country. Commanding officers of such vessels sign the necessary receipts covering the supplies they receive and these finally reach the Admiralty of the Ministry of Marine, as the case may be, and are referred to United States Naval Headquarters for auditing and reimbursement.

5. *Repair Section.*—The Repair Section keeps in touch with the needs of all forces in the matter of overhauling and repair, arranges with the different allied services for repair and docking facilities and keeps the department informed in regard to the material which must be provided from the United States.

6. *Ordnance Section.*—The Ordnance Section keeps in close touch with the requirements of all forces as regards guns, ammunition, depth charges, and ordnance equipment of all kinds. It also follows closely mining operations and cooperates with the Admiralty and with the Mine Force in carrying them out.

7. *Medical Section.*—The Medical Section has general supervision over all naval hospitals, keeps informed of the location of all sick and injured, and of their disposition and arranges to have them cared for in allied hospitals wherever they can not be treated in our own naval hospitals. There are at present three naval hospitals in commission in Europe; one at Strathpeffer, Scotland, one at Queenstown, Ireland, and one at Brest, France. In these, and in certain Red Cross hospitals devoted entirely to naval use, there are more than 3,000 beds.

8. *Aviation Section.*—Before the Naval Aviation Service could begin operations, it was necessary to establish aviation stations, to equip them, provide planes, and train the personnel. This work was placed under the direction of Capt. H. I. Cone. Capt. Cone established headquarters at Paris and the aviation section of Admiral Sims's staff has had as its chief function the work of assisting Capt. Cone in every possible way, and particularly by establishing the closest cooperation with the British Air Service.

Digitized by Google

As fast as the stations that are being built and equipped are ready for operation they are placed under the commanders in the different areas, who direct their operations just as if they were surface naval craft. There are at present 27 United States naval air stations in England, Ireland, France, and Italy, with a total personnel of 300 pilots, and 11,000 machinists and other assistants.

9. *Intelligence Section.*—Since the time of all officers of the various sections of the staff is completely taken up by their immediate duties and the current business, it is necessary to have a section for the single purpose of obtaining and and furnishing information which may affect the work of the various sections. For example, the Intelligence Section follows the movement of all enemy submarines, studies their method of operation, and keeps the Operations Section informed of the latest information available in order that convoys may be safely routed and handled. The different sections of the staff call upon the Intelligence Section to collect and prepare information on a great variety of subjects.

Examples of the questions received are as follows:

(*a*) What has been the percentage of sinkings by submarines in the various areas for the past two months?

(*b*) What is the proportion of shipping passing into the English Channel to that passing into Gibralter?

(*c*) What information is there available as to engagements of United States naval vessels with enemy submarines and the results of these actions?

The Intelligence Section is constantly engaged in making summaries of information and compiling statistical and other data in convenient form for the information of the other sections of the staff.

The Intelligence Section also transmits all important information received and the results of its own investigations to the department, to Army Headquarters, and to the operating forces. It works in close cooperation with the Intelligence Division of the admiralty, and one officer, who is especially detailed, spends a great part of his time in the Admiralty Intelligence Division. In this way it is possible to obtain for the department all information available concerning enemy submarines and the submarine campaign, methods of attack and operations of the enemy, and information as to their future plans, which is obtained by the admiralty from prisoners or through their own intelligence service.

10. *Disbursing Section.*—The Disbursing Section has general supervision over all financial disbursements for personnel, and those required for the administration of the United States Naval Headquarters.

11. *Communication Section.*—The Communication Section arranges all lines of radio, cable, and telegraph communication between the forces operating under Admiral Sims and with the Navy Department. The cable and telegraph office established at Admiral Sims' headquarters is operated by United States naval personnel. There are direct wires to the cable and telegraph lines of communication throughout Europe. All dispatches to and from the Navy Department and the forces in European waters pass through this office. During the month of June the average traffic in received and sent messages was 13,500 five-letter code groups each 24 hours.

Practically all naval dispatches are handled in Navy codes and ciphers.

The Communication Section also works in close cooperation with the Signal Division of the admiralty, supervises the use of codes, ciphers, and radio communications of the forces under Admiral Sims, and looks after the distribution of codes and ciphers to these forces. Trans-Atlantic radio stations in France and the United States are being used for certain classes of dispatches, and a system is being perfected for the use of trans-Atlantic radio in case of the breakdown or cutting of the trans-Atlantic cables. A trans-Atlantic radio receiving station is installed at headquarters, which receives messages from the United States, France, Germany, and Italy.

The head of this section is a member of the Inter-Allied Signal Conference and of the Inter-Allied Radio Commission, which meet quarterly for the purpose of administering the communications of all the allied forces.

The Communication Section is also in close touch with the admiralty and Royal Air Force Radio Material Divisions and supervises all radio material for naval vessels and shore stations under Admiral Sims. Radio telephones and United States naval aircraft. Radio repair bases are being established at convenient shipping points throughout Europe.

12. *Personnel and Secretarial Section.*—The Personnel Section, under the direction of the flag secretary, keeps a record of the location of all officers and men in Europe, issues all necessary orders, and provides transportation for all officers and men.

There are at present 47,000 enlisted men and 3,542 officers of the Navy serving in European waters (including naval aviation personnel). There are now over 250 vessels, including 77 submarine chasers, under Admiral Sims' command. Twenty-five other chasers and numerous other vessels are designated or en route.

Digitized by Google

This section also administers the handling of all correspondence and supervises the mail service for the forces in European waters. A complete card index of all men serving in European waters is maintained, and many thousands of personal letters are forwarded each week to the proper addresses. This section also provides and supervises the clerical staff at headquarters, and administers the headquarters' buildings.

13. *Administrative section.*—All correspondence and telegraphic communications pass through one office, whose function is the coordination of the work of the various sections. This office, directed by the Assistant Chief of Staff, is thus enabled to make sure that the members of the staff do not work at cross purposes. If letters or telegrams originating in one section affect other sections, they are referred to them before being sent out.

UNITED STATES NAVAL FORCES IN EUROPEAN WATERS.

United States naval forces operating in European waters may be briefly grouped as follows:

(*a*) The force based on Queenstown handles certain merchant convoys coming to France and to the United Kingdom and also fast British liners carrying United States troops. This force is composed of 24 destroyers, 2 tenders, and 3 tugs. Two additional destroyers of this force are temporarily assigned to duty at Plymouth with the submarine chasers, and one is in the United States for the renewal of her boilers.

(*b*) The force based on the French coast escorts troop ships into the French ports and out to sea, assists the French in escorting coastal convoys up and down the French coast and across the channel to England, and aids the French in keeping the channels clear of mines. This force consists of 33 destroyers, 16 yachts, 9 mine sweepers, 5 tugs, 4 repair ships, 1 barrack ship, 2 barges, and 1 tug which is temporarily assigned to duty in the Azores.

(*c*) The force based on Gibraltar works with the British in escorting allied trade in and out of the Mediterranean. This force consists of 2 scout cruisers, 5 destroyers, 6 Coast Guard cutters, 5 gunboats, and 10 yachts. In addition 1 destroyer and 1 gunboat of this force are now in the United States for a general overhaul.

(*d*) At Plymouth, England, there are 41 submarine chasers with 2 destroyers and 1 tender. These are engaged in hunting submarines in the entrance to the English channel. There is also 1 submarine from Berehaven at Plymouth on temporary duty.

(*e*) At Berehaven are six submarines with a submarine tender engaged in hunting enemy submarines off the entrance to the Irish Sea and the English Channel.

(*f*) At Corfu are 36 submarine chasers with a tender, which are engaged in hunting submarines in the Adriatic Sea.

(*g*) With the Grand Fleet are five battleships operating as a battle squadron of the fleet.

(*h*) The mine force, based on Inverness and Invergordon, is working with the British in the laying of mines in the North Sea. This force is composed of 10 mine planters, 1 repair ship, and 2 tugs.

(*i*) The force based on the Azores is engaged in patrolling in the vicinity of the Azores to keep the route clear in order that our submarine chasers and other craft can safely use the port for coaling and obtaining supplies while en route ro Europe. This force is composed of four submarines, one gunboat, one monitor, two yachts, and a marine detachment on shore. There is also one tug from the Brest force on temporary duty at the Azores.

(*j*) There is a fleet of merchant ships engaged in carrying coal for the United States Army from England to France, which are under Admiral Sims's general control; 73 such ships have been commissioned or orders have been given for their commissioning.

(*k*) There are at Southampton four cross-channel transports engaged in carrying troops across the channel. These are commissioned ships under Admiral Sims's command.

(*l*) At Murmansk, Russia, there is one cruiser cooperating with the allied forces in Russia.

(*m*) At Genoa there are two tugs, which have been placed at the disposition of the Italian Government.

(*n*) At Liverpool there are two tankers.

While the United States Navy is doing its bit and doing it well, a sense of proportion must not be lost. Our effort is small compared with that of our Allies.

In this connection the following approximate percentages are of interest as giving a comparison between the naval effort of the allied powers. The percentage of the various types of vessels engaged in the antisubmarine campaign in British waters and eastern Atlantic is about as follows:

Digitized by Google

	Great Britain.	France.	United States.
	Per cent.	*Per cent.*	*Per cent.*
Destroyers	80	6	14
Submarines	78	17	5
Miscellaneous patrol craft	86	11	3

The following percentages give a similar comparison of the naval situation in the Mediterranean:

	Great Britain.	France.	Italy.	Japan.	United States.
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
Destroyers	27	38	26	7	2
Submarines	13	37	50	.....	.....
Miscellaneous patrol craft	22	66	4	.....	8

In the Grand Fleet Great Britain has about 91 per cent of the major fighting forces and the United States 9 per cent.

Of the total number of all patrol craft operating against enemy submarines in British and eastern Atlantic waters, the American patrol forces constitute less than 5 per cent of the total number. In the Mediterranean the United States supplies 5 per cent of the patrol forces.

As a comparison between the naval aviation effort of Great Britain and the United States the following data is of interest:

Great Britain had about four and one-half times as large a naval aviation personnel as the United States, and about three times as many naval aviation stations. Great Britain has approximately fourteen times as many seaplanes as the United States, and those British machines patrol eight times as many miles during the week as the American machines.

On August 1, 1918, it has been estimated that the British Navy has on active service in European waters approximately over three times as many officers and over four times the enlisted personnel of the American forces operating in European waters. This estimate must be assumed as low because it does not include the hundreds of officers and thousands of men the British have in their so-called auxiliary patrol service.

MEMORANDUM ON ATLANTIC CONVOY SYSTEM (AS REQUESTED BY THE HOUSE NAVAL COMMITTEE).

A further significant illustration of the relative parts being played by the United States Navy and the allied navies is given by a study of the Atlantic convoy system and by the protection and escorting of American troop convoys to Europe.

Taking into consideration the whole Atlantic convoy system, that is, all shipping in the Atlantic, whether French, Italian, American, British, or neutral shipping in allied interest; also United States troop transports and troop convoys bound for the Mediterranean, the shipping is protected by the naval vessels of the Allies in the following proportions:

Great Britain provides destroyers for 70 per cent of all convoys.

United States provides destroyers for 27 per cent of all convoys.

France provides destroyers for 3 per cent of all convoys.

All convoys at sea in the Atlantic are protected by cruisers so as to guard against attack by enemy raiders. The cruisers necessary for protecting the allied shipping in the Atlantic in this way are provided as follows:

	Per cent.
Great Britain	61
United States	35
France	4

Great Britain has organized and arranged and provides the signal codes and instructions for the entire convoy system; also commodores and signal men for the great majority of all convoys.

The convoy system usually carries the shipping as far as the European coast, where it is generally diverted on a coastal route as to its destination. This necessitates a

Digitized by Google

great amount of coastal escorting. Great Britain provides coastal escorts for the Irish Sea, English Channel, and North Sea, and, in general, throughout all coastal waters of the United Kingdom.

Great Britain also provides destroyers for all Allied shipping across the North Sea; escorts for practically all shipping across the English Channel between England and France, and also keeps all channels in British waters clear of mines.

There is very little coastal escort required on the French Channel coast as all shipping follows the English coast. On the French Atlantic coast, the United States furnished three-eighths of the coastal escort and France furnishes the remaining five-eighths. The United States also furnishes about one-third of the mine-sweeping forces on the French Atlantic coast.

British destroyers are now rendering the following protection to United States shipping:

United States troops.—(*a*) British destroyers escort 52 per cent of the United States troops that come into England. (*b*) British destroyers escort all of our troops that cross the English Channel going to France. (*c*) British destroyers escort all United States troop ships bound up or down the English Channel.

Army store ships.—(*a*) British destroyers bring into the English Channel about half of the store ships that carry supplies for the United States Army. (*b*) British destroyers escort into Scottish ports all United States mine carriers bringing mines for the North Sea barrage.

United States merchant shipping.—(*a*) British destroyers provide the coastal escort for United States ships along the south and east coast of England. (*b*) All United States trade with Scandinavia is escorted by British destroyers. (*c*) All United States trade with Holland is escorted by British destroyers. (*d*) All United States ships bound out of the English Channel from either French or British ports are escorted to the westward by British destroyers.

(Intelligence Section, United States Naval Headquarters, London, August 3, 1918.)

NAVY'S SPLENDID ACHIEVEMENTS IN THE WAR WERE IN SPITE OF DELAYS, INACTION, AND VIOLATION OF MILITARY PRINCIPLES BY THE HIGH COMMAND IN FIRST MONTHS OF WAR.

The statistical tables and the memorandums which I have just referred to will give a sufficiently comprehensive idea of the growth and importance to the Navy Department of their advance headquarters in Europe after they had once adopted the policy which they announced in July, 1917, of cooperating wholeheartedly with the Allies. Of course, when once the available naval forces for operations afloat and a sufficient number of capable officers to administer these forces, to control their operations and to coordinate our activities with those of the Allies were available, there could be no longer any question of the effectiveness of our help. The Allies themselves have repeatedly assured us of the vital services rendered by our Navy to the allied cause, and we of the Navy can take pride in the record that was achieved. Great as this record was I think I have said enough to convince you that it would have been infinitely more effective if the policies ultimately adopted by the Navy, and which can be found set forth in the Secretary of the Navy's Annual Report of 1918 had been put into effect from the moment when we entered the war instead of after dangerous delay of many months.

Furthermore, it seems to me that these achievements of the Navy should gain greater importance in the public mind when it is realized as has not been generally realized, outside of the service, that they were accomplished not because of an equal amount of efficiency in the higher command which directed them, but rather in spite of long delays, inaction, and violations of fundamental military principles committed by the high command in the first months of the war. In other words, the personnel of our Navy afloat, in accomplishing

Digitized by Google

the mission assigned them had to struggle with the enemy and also endure the handicap of an uncertain policy and of misdirection such as I have repeatedly pointed out in the cases which I have reviewed before this committee.

Let me state in connection with this and other tables that I submitted that they are compiled from the records that we have available. It is barely possible that you might find that instead of six ships arriving at a certain time, there might have been seven or might have been five. There may very probably be inaccuracies of that kind, but the tables are presented as an illustration of the general flow of the forces to the other side, and the inaccuracies would not interfere in the slightest with the impressions that they would convey.

COMMANDER NAVAL FORCES IN EUROPE NOT ALLOWED TO SELECT PRINCIPAL SUBORDINATES.

In paragraphs 74 and 75 of the letter which I addressed to the Navy Department on January 7, 1920, I called attention to the violation by the department of a fundamental principle of military command. In No. 7 of my summary of conclusions, I stated:

> The department's commander in the critical area of hostilities was never allowed to select his principal subordinates and was not even consulted as to their assignment. A fundamental principle of the art of command is here involved.

I think I may say that without exception the commanders of the subordinate units operating in European waters under my command were selected by the department without previous reference to me and without observing this principle of the art of command. Practically from the time of the sending of the first forces abroad, I endeavored to convince the department of the necessity of securing the closest coordination and harmony in our forces abroad by the selection of commanders subordinate to me who would be in sympathy with my policies and that I should be at least consulted before their selection. I am, of course, unaware as to the policy which governed the department in making these selections; but in practically every case the first intimation that I had of an officer being assigned to a subordinate command was the information that he had sailed to take up this command. Thus, the first official information which I received concerning the officer to command on the French coast was a dispatch I received from the department on July 5, stating that this officer would arrive on the coast of France on July 5. Similarly, with the commander of the first force sent by the department to Gibraltar, the first intimation I had of the selection of this commander was in the middle of July, two weeks after the department had informed me of their intention to send vessels to Gibraltar.

I repeatedly requested officers for definite subordinate commands in Europe, based on my knowledge of the requirements, of the position, only to have these recommendations disapproved by the department. It will hardly be necessary to go into details in this regard to substantiate this point, because it is a principle so elementary that it only needs to be stated to be proved, and if I were to enter into a discussion of this particular point it would inevitably

Digitized by Google

involve the discussion of personalities, which I consider as quite apart from the purposes of this investigation. I have at no time during this investigation made any reflections upon any naval officer in our service, and I have no intention to do so. It would serve no useful purpose and would not contribute to the good of the Navy, which is the one interest which actuates me.

In a personal letter addressed to Admiral Benson on July 28, I fully stated the reasons which had led me to request that I be permitted to nominate for subordinate commands officers who were completely in sympathy with me and in whose ability and loyalty I could have complete confidence. The paragraphs of this letter of interest are as follows:

(12) In case it should be your intention to send additional flag officers for the above-suggested places, or for others, I hope that you will give me a chance to select the officers or at least to exercise choice within such limits as you may think it necessary to prescribe.

You know, of course, to what an extent personality counts for efficiency under the circumstances which now exist over here, and how highly important it is that we should have officers on duty in European waters in positions of responsibility who are not only willing to cooperate with our Allies here whole-heartedly and loyally but who have the necessary tact and personality to render this cooperation successful.

Perhaps it is equally important that the officers indicated should be in sympathy with me and my methods. You know the difficulty that has arisen through lack of sympathy of this kind. I feel that this particular point should be given very serious consideration, because not to do so might add very considerably to the strain which I necessarily have to bear.

In a cable sent on August 9 to Admiral Benson I nominated an officer for the command of the base at Cardiff, stating in full my reasons for making the request, but this officer was not chosen.

In later cables of the same month I made other suggestions as to appointments abroad, with similar lack of result.

On September 30, in cabling to Admiral Benson, I therefore said:

Simben 37. Referring to my letters explaining the regrettable difficulties and resulting inefficiency caused by the assignment of officers to vitally important positions who have in the past been opposed to me in official matters and who are not in sympathy with my methods, I respectfully request that if none of the officers mentioned in my cable number Simben 27 are available the department cable me the names of those who are available, so that I may recommend the officer who in my judgment is best qualified to successfully cooperate with me and the French and British admiralties in carrying out the increasingly complicated convoy system upon which depends the safe arrival of our troops and their supplies, and to enable me efficiently to discharge my responsibility to the department.

SIMS.

CONCLUDING STATEMENT.

I have now concluded my introduction of testimony and documentary evidence in substantiation of the statements made in my letter to the Navy Department, of January 7, 1920, regarding the military errors committed by the Navy Department in the initiation and conduct of the war. The official documentary evidence incorporated in the hearings establishes the following facts:

1. That, in spite of the fact that war had been going on for nearly three years, and our entry into it had been imminent at least from February 2, 1917, the vessels of the Navy were not ready for war service when the United States entered.

2. That the first few months after America entered the war were extremely critical ones for the whole allied cause, due to the success of enemy submarines.

Digitized by Google

3. That this critical situation was made clear to the Navy Department a few days after America entered the war, and repeatedly thereafter by cables and letters, and supported by independent advices to the Government from the American ambassador in London and by Mr. Hoover in person.

4. That the Navy Department supplied me with no plans or policy covering our participation in the war for three months after our entry therein.

5. That, having information as to the critical situation of the Allies, the Navy Department did not promptly assist them, and thereby prolonged the war by delaying the sending of antisubmarine vessels, none reaching Europe for nearly a month after war was declared, and three months elapsing before 30 vessels arrived.

6. That the Navy Department failed to appreciate the military value of time.

7. That the Navy Department violated fundamental military principles in attempting to formulate war plans of operation without having sufficient knowledge of the whole situation.

8. That the department's representative with the allied admiralties was not supported, during the most critical months of the war, either by the adequate personnel or by the adequate forces that could have been supplied.

9. That the Navy Department violated fundamental military principles in dispersing forces away from the critical area in order to meet diversions of the enemy.

10. That the Navy Department, in the first months of the war, attempted the direction of details although 3,000 miles distant from the scene of active operations, where the situation was changing from day to day.

11. That the Navy Department, in not clearly defining the responsibility and delegating authority to its representative in Europe failed to follow sound principles, common alike to the business and military professions.

12. That the Navy Department, by controlling the operations and movements of certain forces within the war area, violated the fundamental military principle of unity of command.

13. That the Navy Department failed to keep its representative abroad completely informed as to its plans affecting dispatch and disposition of forces in the war zone, and frequently reached decisions in such matters through information gained from sources other than its representative in the war zone.

In no part of my testimony have I charged the responsibility for any of the failures enumerated against any person, but I have tried to make it clear that the responsibility for these failures rests, in my opinion, upon the Navy Department as an organization rather than upon any individual. If any individual was responsible, wholly or in part, for the failures I have pointed out, the fact would necessarily have to be developed by persons who were in a position to know the inner workings of the department during the period in question.

My official knowledge extends only to the doors of the department and not beyond them. The fact that numerous letters and cable dispatches which I have submitted in evidence bear the signature of this or that person, is not to be taken as an indication that I believe

Digitized by Google

the signer personally responsible for the action indicated. They merely indicate that the letter or dispatch was official and written with the authority of the Navy Department as an organization.

To point out violations of well known and generally accepted principles of warfare such as have been shown by my testimony is in itself to suggest the remedy which is obviously to avoid such violations in the future. It not having been shown up to this stage of the investigation whether these violations of principle were due to faulty organization of the Navy Department or to faults of personnel I am not, at present, able to submit well-founded recommendations looking to the adoption of measures to insure us against similar violations in the future.

My testimony has been devoted almost entirely to pointing out defects in the administration of the Navy in the first few months of the war. This does not mean that I have been insensible to the splendid work done by the Navy at large or by the bureaus and other offices of the Navy Department. I have, at different times, in letters to the chiefs of the bureaus of the Navy Department, and to other officials, including the Chief of Naval Operations, expressed my personal satisfaction at the splendid way in which many of my requests had been met, particularly during the latter part of the war.

Taking the service as a whole, I have the most profound admiration for the manner in which the officers and men of the regular Navy, Naval Militia, and Reserve Force carried on their duties in this war, and have expressed this admiration in a series of articles now being published. Not only from the war zone, where events were constantly before me, but from home and remote areas, reports reached me which showed, beyond any doubt, what a magnificent body of officers and men we had in the Navy. You may be sure, gentlemen, that the Navy, if loyally and properly supported and directed, may be counted upon to maintain the finest traditions of the service.

It is a source of the greatest pleasure to testify to the pride and gratitude I feel for the manner in which the Naval Militia and the Reserves—in many instances at great personal sacrifices—came to the aid and support of the regular Navy. Without their invaluable help much of the work done by the Navy in this war could not have been undertaken. It would require volumes to tell of the hundreds of ways in which their splendid services made success possible. The outstanding feature of their service was the cheerful and loyal support which they gave to the regular Navy at all times and under all conditions. I can not commend too highly their services to the nation.

It is furthermore a great pleasure and satisfaction to me to be able to testify to the magnificent way in which the many enterprises were undertaken and pushed to a successful completion by the united efforts of bureaus of the Navy Department, and the naval personnel engaged in the operations. I can not pretend to enumerate completely the operations of this nature which contributed to the winning of the war. I may mention, as typical examples, the northern barrage, the railway batteries, the transport of troops, and the training of officers and men in the ships of the Atlantic Fleet that remained in home waters.

Digitized by Google

It is, of course, to be expected in connection with an investigation of this sort, particularly of a war which was won by great sacrifices and gallant, patriotic services of the entire Nation, that the first thought which occurs to mind is that hindsight is better than foresight, and that it is always easy, in the light of hindsight, to point out our errors committed in any undertaking. I submit, however, that, as the issue here under investigation is one vitally affecting our future national safety, we should not let such thoughts carry us away and blind us to dangers which the lessons of the past have clearly indicated. Hindsight must not be blindsight.

I wish also to repeat and to emphasize at this time that no claim is made that my recommendations or advice should have been accepted because they were mine, but they should have been heeded and acted upon because of my position in continuous consultation with the heads of the allied navies. There should be no question as to whether I merited the confidence of my superiors. If I did not, then an additional violation of a fundamental military and business principle was committed in leaving me at my post. I should have been removed as soon as there was the slightest loss of confidence in me.

If I have shown that there was a lack of conviction or clear understanding on the part of the Navy Department as to where its efforts should be directed; if I have shown that the Navy was hampered by a lack of preparedness, by lack of essential plans, and by being held back in the beginning; if I have demonstrated that victory was won not because of these errors but in spite of them, and that such errors were only nullified by a combination of circumstances which we would be foolhardy indeed to count upon in the future—then I will feel that I have been fully justified in submitting my letter of January 7, 1920.

That finishes my statement, Mr. Chairman.

The CHAIRMAN. As Senator Pittman has asked that the cross-examination be put over until to-morrow, we will now stand adjourned until to-morrow morning.

(Thereupon, at 11 o'clock a. m., the subcommittee adjourned until to-morrow, Friday, March 19, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

MONDAY, MARCH 22, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office building, Senator Frederick Hale presiding.

Present, Senators Hale (chairman), Ball, Keyes, Pittman, and Trammell.

The CHAIRMAN. The committee will come to order. Senator McCormick has been obliged to retire from the subcommittee, and Senator Page has appointed Senator Keyes in his stead.

TESTIMONY OF ADMIRAL WILLIAM S. SIMS—Resumed.

The CHAIRMAN. At the meeting on March 9 it was decided that each witness be permitted to finish his direct testimony before any cross-examination takes places, or anything in the nature of cross-examination, and that thereafter any member of the committee be permitted to cross-examine, and that his cross-examination be finished before being interrupted by any other member of the committee, so as to have an orderly process of examination. We shall accordingly follow that procedure unless it is found by the committee that it does not work satisfactorily.

Admiral Sims, in your letter to the Secretary of the Navy of January 7 you stated:

> No formal instructions or statement of the Navy Department plans or policy were received at that time, though I received the following explicit admonition: "Don't let the British pull the wool over your eyes. It is none of our business pulling their chestnuts out of the fire. We would as soon fight the British as the Germans."

The committee would like to know, Admiral Sims, who made that statement to you, who were present at the time, and what were the circumstances under which it was given,

Admiral SIMS. If the committee will permit, before answering that question, I should like to make a short correction in the statement I made at the last hearing. My attention has been invited to a misinterpretation of my statement in the hearings, that the routes followed by all United States convoys through the war zone were furnished by my headquarters in London. I intended to convey the fact that it was the European organization which did this routing rather than the Navy Department itself. While the general plans of this routing were of necessity formulated in London, in harmony with the whole allied convoy system, a great amount of detailed routing was necessarily done, and very successfully done, by Admiral

Digitized by Google

Wilson, in command of all naval forces on the French coast, also by Admiral Niblack at Gibralter, Admiral Dunn at the Azores, and other commanders.

This has been corrected in the hearings.

In reference to the question that you have asked me, you have noticed that in all of my testimony I have avoided any personal references, and that I have not attempted in any case to fix any personal responsibility. I have tried to make it clear that my criticisms referred to the organization known as the Navy Department and not to any individual; that my criticisms stopped at the doors of the department. I am not informed as to what took place, completely, in the department during the war, and if the committee wants to know that, it must be brought out by others.

I think that in answering the question I had better relate the circumstances under which it was given to me. I was telegraphed to at Newport to come to Washington. Everything was very secret. Secrecy is one of the things that Government departments love. I was told not even to come to the Navy Department, but to telephone to the department, as I remember to the Chief of the Bureau of Navigation, for instructions, probably to arrange an interview. I tried to do so and could get no reply at all from the department, so I went there and reported to the Chief of the Bureau of Navigation, who was then Rear Admiral, now, Captain, L. C. Palmer. He told me that I was to be sent abroad to confer with the allied admiralties. He said that I was to go secretly, under an assumed name, and not even to take uniforms with me.

I was then taken in, or rather sent in, to see the Secretary of the Navy, as nobody went in with me and nobody was present at the interview. The interview was very brief. In substance the Secretary said that I was being sent abroad to confer with the admiralties on the other side, and to use the cable freely in advising them as to how best they could cooperate with the allied navies, in case we were unfortunately drawn into war. He also told me that the reason I was being sent over was because of a request from the then ambassador in London, Dr. Page; that an officer of high rank should be there, as officers of the rank of rear admiral were representing other countries I believe the Navy Department had taken the initiative in suggesting that an officer be sent over to confer with the other admiralties.

He gave me a copy of the telegram from Ambassador Page. I can submit a copy of that if it is required. We have it.

In his testimony on the awards, the Secretary of the Navy stated that he had reminded me of the indiscretion that I committed in 1910 in the speech at the Guildhall. The Secretary's recollection on that point is thoroughly mistaken. No reference whatever was made to the Guildhall speech by anybody in the Navy Department on this occasion.

When I came out from the Secretary's room, or just before I went in—I can not remember now which—in somebody else's office, I think it was the office of the Chief of the Bureau of Navigation, and while my recollection is not clear on that, I think he was present, at all events he told me that he was present; and it was there that the admonition in question was given to me by a certain official of the Navy Department. As I said before, I wanted to avoid all personalities,

Digitized by Google

and I should much prefer now to relate the incident and explain why I put it in my letter, without referring to the name of the individual.

The CHAIRMAN. I think the name of the individual should be brought out, Admiral Sims, and the committee would like to have you give it.

Admiral SIMS. The person who gave me the admonition was Admiral Benson, the Chief of Naval Operations. I had no interview with him. I received no instructions from him. The remark was preceded by nothing and was followed by nothing. It was told to me in all seriousness, and with bitterness, and I turned around and left the office immediately.

The CHAIRMAN. Was anyone present in the room when he told it to you?

Admiral SIMS. That is where my recollection of that particular incident is not clear, but Admiral Palmer has told me that he was in the room at the time, and that he remembers a remark of that character being made, although he is not able to recall exactly what it was.

The CHAIRMAN. There was no one else present excepting Admiral Palmer?

Admiral SIMS. As far as I can recollect; that was, as I remember now, pretty late in the afternoon of the day that I arrived in Washington.

The next day I had to go to the Navy Department to get papers, etc., before leaving, and I met Admiral Benson again, not in his own office or in that office, and there, in the presence of a number of officers, whether within their hearing or whether they heard or not I do not know, he repeated to me exactly the same remark, preceded by nothing and followed by nothing.

The CHAIRMAN. You do not remember who the other officers were?

Admiral SIMS. I do not know who they were, but I could probably find out. About six months later in my office in Paris he made a similar statement; at least, to the effect that I was not to allow the British to pull the wool over my eyes or to pull their chestnuts out of the fire, or something to that effect. I will admit that I had completely forgotten the incident. It was recalled to my mind by a member of my staff who was present, and who heard it. I think that the reason that I did not remember that distinctly was because I regarded this as a personal idiosyncrasy of the admiral. I had known the general opinion that he was intensely anti-British, but it did not affect me particularly.

The CHAIRMAN. I think it should be made perfectly clear that Admiral Benson in his second statement did not state to you that we would as soon fight the British as the Germans.

Admiral SIMS. Not at all; no.

The CHAIRMAN. To be fair to Admiral Benson, that ought to be made very clear.

Admiral SIMS. I want to make that very clear. He did not, of course, say that. I have regarded this always as simply a personal prejudice, you may say, on the part of Admiral Benson.

I would also like to say that I have always had the best possible relations with Admiral Benson. I regard him as an upstanding and honest man who has exceedingly strong convictions, and who is very

Digitized by Google

firm in adherence to these convictions. I believe everything he has done during the war has been done conscientiously, and to get along with the war. I believe that it is due to Admiral Benson alone that I was given the opportunity to serve in this war as the commander of the forces abroad. In fact, he told me that his insistence upon my being put in command of those forces abroad had brought upon him the enmity of pretty much all the senior officers of the Navy, that being due to the fact that when I was appointed I was the last name on the list of rear admirals in the Naval Register at that time. I state this in order to make it clear that there is nothing whatever personal about this.

Now, my reason for putting it in the letter may not be so clear to a civilian as it is to a military man, but the spiritual foundation of every war is the will to victory, and if any man, no matter how honest, has an invincible prejudice against the people that we are fighting alongside of, it is very probable that it has an unconscious influence upon him; and that is the reason that in submitting this letter for the consideration of the Navy Department, I put that in there, as one of the most important things in the letter, that if ever we go into a war again we want to make sure that the spiritual foundation of our organization, the will to victory, is sound.

Now, I would like to touch on one other thing.

Senator PITTMAN. Is this in answer to the chairman's question?

Admiral SIMS. In answer to the chairman's question; closely related.

Senator PITTMAN. I think that I am at liberty to guard against any more letters coming in.

Admiral SIMS. Any more letters?

Senator PITTMAN. I think that I am at liberty now, in view of prior experience, to guard against any extraneous matter coming into the record.

Admiral SIMS. This is not extraneous. It relates to the same subject, and it is this, that in his testimony before this committee on the awards, Secretary Daniels, in reference to me and in reference to this particular incident, said, "as a naval officer, he had no business to think who was the enemy." That, to me, is a perfectly astounding statement. I received no instructions; I received no expression of policy. Manifestly, no plan can be based upon anything except the knowledge of who your enemy is going to be; and I had every possible business to think who my enemy was. That is all I have to say on that particular subject.

The CHAIRMAN. Admiral Sims, you are still under direct examination. Have you any further matters that you wish to bring out?

Admiral SIMS. No; I think not.

The CHAIRMAN. Have you any questions to ask of Admiral Sims, Senator Ball?

Senator BALL. No.

The CHAIRMAN. Have you, Senator Keyes?

Senator KEYES. No.

The CHAIRMAN. Have you any questions to ask Admiral Sims, Senator Pittman?

Senator PITTMAN. Yes. Admiral Sims, this statement that you attribute to Secretary Daniels, that it was not your business to

Digitized by Google

consider against whom you were going to war, or words to that effect, that was made in his testimony here, was it not?

Admiral SIMS. Yes, sir.

Senator PITTMAN. That was not given you as a part of your instructions when you went to Europe?

Admiral SIMS. No, sir; it was not.

Senator PITTMAN. You state that Admiral Benson told you that it was upon his insistence that you were sent over on this mission at the time you were sent?

Admiral SIMS. I am not quite sure whether it was on his initiative that I was sent over, but I wanted to convey the impression that it was on his insistence that I remained over there as the officer in command of the forces. I was sent there first as a liaison officer, and it was subsoquently to that—we can give you the date if you want it—that I was put in command of the forces that were going over there.

Senator PITTMAN. You have stated that Admiral Benson is antagonistic to the British; that he is prejudiced, you might say, against the British. I do not remember your exact language, but it was to that effect. You do not think that Admiral Benson desired to retain you over there, thinking that you held the same sentiments, do you?

Admiral SIMS. Yes; I do, sir.

Senator PITTMAN. That he thought you were antagonistic to the British?

Admiral SIMS. No, sir; he did not think I was antagonistic to the but he thought that I was pro-British.

Senator PITTMAN. Yes.

Admiral SIMS. But he had reasons for retaining me over there in spite of that.

Senator PITTMAN. Then, as a matter of fact, if that be true, and Admiral Benson desired you to go over there, he wanted some one to go over there who was pro-British, and with whom the British would be confidential; is not that true?

Admiral SIMS. I do not know, I am sure. He wanted somebody over there that he thought could hold down the job. There were a good many reasons, as I see it, why I should have been sent over there as liaison officer, and why I should have been retained in command. Those reasons are as follows: That I knew a great many of the British officers, as I had gone over there from 1900 to 1907 or 1908, five or six times, in order to talk with the then leading officers of the British Navy about progress in gunnery, Admiral Scott, Admiral Jellicoe, who was then Chief of the Bureau of Ordnance, Admiral Bacon, who was there, and Admiral Madden, and men of that stamp; so that I knew them all more or less intimately, had corresponded with them when neither of us knew much about shooting.

I had also been naval attache in Paris from about the beginning of 1897 until about 1900, or nearly four years. I know those people. I had gone over there in 1899 and spent a year in Paris for the object of acquiring a certain facility in handling the language.

For those reasons I was sent over there as a liaison officer, and for the same reasons, I assume, I was retained there in command, it being assumed, I suppose, that a man who had these relations and acquaintances with all these people, and who knew their methods and habits

Digitized by Google

of thought and action, and who could speak both the French and the British languages with reasonable facility, was the logical man for the position, at least to begin with.

Senator PITTMAN. If Admiral Benson did not send you over there because he thought you would probably be treated with some confidence by the British admirals, but sent you over by reason of the facts that you have just stated, then Admiral Benson is a very broad-minded executive naval officer, is he not?

Admiral SIMS. I have always considered him a perfectly fair and square and honest man in all respects. I do not know just what "broad minded" means in this connection.

Senator PITTMAN. You would not consider that he was very narrow, or that he was controlled by his prejudice, if his motive in recommending you being retained over there is such as you have stated?

Admiral SIMS. I should.

Senator PITTMAN. You should what; think that he was prejudiced?

Admiral SIMS. I should think that a man who was intensely anti-French and anti-British would insensibly be controlled, as any other men is, by those sentiments, to a certain extent.

Senator PITTMAN. That was not my question. I stated that if he were moved by the considerations that you have suggested, that is your supposed eminent fitness for that position, at the same time being bitterly prejudiced against the British and believing that you were a pro-Britisher, and in spite of all that he was moved by the motives that you urge, then he is a man that is peculiarly above prejudice in determining what is in the interest of the Navy.

Admiral SIMS. I should not say so at all. I should say that he was a perfectly fair and square and high-minded gentlemen to have acted as he did; but. all the same, that he would in all probability be insensibly influenced by his anti-British feeling.

Senator PITTMAN. When you were sent over there we were not at war?

Admiral SIMS. We were not at war, but I was sent over there because we were going into the war immediately.

Senator PITTMAN. We were going in immediately?

Admiral SIMS. Yes.

Senator PITTMAN. Do you not know that that was a matter that could solely be determined by Congress?

Admiral SIMS. Yes, I know that.

Senator PITTMAN. And, you knew that we were going into the war immediately?

Admiral SIMS. Yes, I knew it perfectly well.

Senator PITTMAN. Of course no one else knew it. That preknowledge of yours is remarkable.

Now let us go a little further into the letter. At the time that Admiral Benson is alleged to have repeated the warning to you not to let the British pull the wool over your eyes, he did not make the additional assertion in regard to that we had just as leave go to war with one country as another?

Admiral SIMS. You mean six months later?

Senator PITTMAN. Yes.

Admiral SIMS. No, sir.

Senator PITTMAN. Because at that time we were at war with Germany.

Digitized by Google

ADMIRAL SIMS. At that time we were at war.

Senator PITTMAN. I do not remember exactly what your testimony was when you first came in. I will probably pick that up later, on this hearing. But there was some excuse given by you why this letter of January 7 was injected into the middle of our proceedings. But there have been several publications attempting to explain why that letter was made public at that time—your letter of the 7th of January. I have had occasion to read them. Before reading one of these articles I want to call your attention to the fact that in the hearing you warned the committee that if they would read the World's Work that was coming out, they would get some facts with regard to various matters you were dealing with.

Admiral SIMS. No, that is not what I said. I said that if they would read the articles that I was writing in the World's Work they would get some facts. I do not know what else appeared in the World's Work.

Senator PITTMAN. Yes, You have been publishing a number of articles in the World's Work?

Admiral SIMS. Yes.

Senator PITTMAN. Who are the editors of that magazine?

Admiral SIMS. Doubleday, Page & Co.

Senator PITTMAN. Those are the proprietors of the publishing company, but who are the writers, generally, in the magazine?

Admiral SIMS. I do not know any of them at all, except perhaps Arthur Page himself, and Burton J. Hendrick. Those are the only two I know.

Senator PITTMAN. Have you ever discussed with Burton J. Hendrick your articles?

Admiral SIMS. Yes.

Senator Pittman. That you are writing?

Admiral SIMS. I am writing them in collaboration with him.

Senator PITTMAN. You are writing them in collaboration with him?

Admiral SIMS. Yes, I am writing them in that way so that people can understand them; so that they will not be too technical.

Senator PITTMAN. He has written some articles over his own signature in the World's Work, describing what you did over there; your connection with the war.

Admiral SIMS. Yes.

Senator PITTMAN. He is very well acquainted with your views on this subject?

Admiral SIMS. No; he is very well acquainted with the operations of the forces on the other side. We have talked over those matters, necessarily.

Senator PITTMAN. He is very well acquainted with your views, is he not?

Admiral SIMS. No, sir; I do not think so.

Senator PITTMAN. Then he guesses them very accurately. Now, in the World's Work for March, in an article on page 425, under the heading, "Admiral Sims and Mr. Daniels," we find the following [reading]:

The paper which Admiral Sims prepared was an official document. It was the carefully reasoned work of himself and his staff; it was written in official form and in official language; and was addressed to Admiral Sim's official superior, the Secretary

Digitized by Google

of the Navy. Had the admiral sent his report to the public press or to any one except the one person entitled to receive it—the Secretary of the Navy—he would have committed a serious breach of discipline. Had he even made public the fact that such a paper existed he would have likewise been guilty of an impropriety. But the man who took the reporters into his confidence, and is thus responsible for all the publicity which has followed, was Secretary Daniels himself. The day the report was received he informed the press that Admiral Sims had sent him a letter which was "critical" of the Navy Department in the World War.

Naturally public curiosity was vastly piqued. A few days afterward Admiral Sims appeared before the Naval Committee of the United States Senate. This committee formally demanded that the admiral produce a copy of this letter. The Congress of the United States is a governmental body superior to Secretary Daniels himself and the Naval Committee of the Senate has the right to demand all available information on the conduct of the Navy Department. Neither could Admiral Sims have declined to furnish the report demanded. To have done so would not only have made him subject to contempt proceedings, but would have placed him in the unenviable position of insulting and defying the legislative powers of the nation. The letter, therefore, went upon the records and thus became public property. If there is anything in the nature of a "scandal"—

The word "scandal" is in quotation marks—

or a "controversy"—

And the word "controversy" is in quotation marks—

or a "washing of dirty linen in public"—

And those words, "washing of dirty linen in public," are in quotation marks—

Secretary Daniels is solely responsible; for, had he not made his public announcement that the report existed, the Senate committee would not have demanded its presentation.

Do you agree with that statement?

Admiral SIMS. I do not agree with the statement, I do not want to agree with it one way or another; but I want to say this: I did not know anything about that until I saw it in the World's Work. I did not know that it was projected, or anything about it at all, and I do not think there is anything in there that has not been published in other reviews and in newspapers, and so forth. In fact, the information there is simply a compilation of what was practically public property. I had nothing whatever to do with it, at all, in any way.

Senator PITTMAN. Where do you suppose he got that expression, a "washing of dirty linen in public"?

Admiral SIMS. Out of the press. I have seen it a number of times.

Senator PITTMAN. Did you ever testify to that on the stand?

Admiral SIMS. Testify to what?

Senator PITTMAN. Use that expression in your testimony?

Admiral SIMS. I may have. I can not remember now.

Senator PITTMAN. I will tell you later.

Admiral SIMS. But I have seen it in the press hundreds and hundreds of times. In fact, there is a cartoon to that effect.

Senator PITTMAN. That was an expression used here by yourself, Admiral.

Admiral SIMS. Yes; but if it was used by the people in the press, it can have no significance so far as I am concerned.

Senator PITTMAN. Yes. Let us go on a little further. This article there says that this letter was not shown to anyone else until it was presented to this committee—shown by you. Is that a fact?

Digitized by Google

Admiral SIMS. No.

Senator PITTMAN. To whom did you show this letter?

Admiral SIMS. I showed it to perhaps half a dozen of my people who used to be on my staff on the other side.

Senator PITTMAN. I would like to know who they are.

Admiral SIMS. We can give you the names of those. Capt. Cone, Capt. Pringle, Capt. Knox, and Commander Babcock, and Capt. Chandler, and Lieut. Kittredge.

Lieut. KITTREDGE. No.

Admiral SIMS. You never saw it?

Lieut. KITTREDGE. No.

Admiral SIMS. They were Capt. Cone, Capt. Pringle, Capt. Knox, Commander Babcock, Capt. Chandler, and my aid, Lieut. Commander Edwards. There is only one other person I showed that letter to, and that was Mr. Davison, in New York. What are his initials?

Commander BABCOCK. H. P. Davison.

Admiral SIMS. H. P. Davison. I was a guest in his house on going to New York to attend a dinner given to Mrs. Whitelaw Reid, and I showed him a copy of that letter on that occasion. To the best of my knowledge, nobody else saw a copy of that letter at all. I did not even put it in my own files, but I kept a file copy myself, and I kept it in my pocket. I did not put it on my own files in Newport.

Senator PITTMAN. And yet you have testified that this letter was written as an official document solely for the Secretary of the Navy, as a naval officer; is not that true?

Admiral SIMS. Yes, sir.

Senator PITTMAN. Do you consider that it was proper, before sending this letter, to have submitted it to a civilian in New York City?

Admiral SIMS. No, I do not think it. That was an indiscretion upon my part. I should not have done so.

Senator PITTMAN. That is the only indiscretion that you have committed?

Admiral SIMS. So far as I know.

Senator PITTMAN. You stated in your testimony, presumably because the department had published its existence, of a general nature.

Admiral SIMS. That is what I thought at the time, but I was mistaken.

Senator PITTMAN. Did that letter contain everything that is now in it, at the time that you showed it to Mr. Davison?

Admiral SIMS. Did it contain everything that is now in it?

Senator PITTMAN. Yes.

Admiral SIMS. Yes; the identical letter.

Senator PITTMAN. The identical letter?

Admiral SIMS. It was not changed in any respect; no.

Senator PITTMAN. Upon what date did you show that to Mr. Davison?

Admiral SIMS. I can find the date by looking back and seeing what time that dinner took place in New York; but along about the middle of January it was.

Senator PITTMAN. About the middle of January?

Admiral SIMS. I should think so; about there.

Digitized by Google

Senator PITTMAN. It was prior to the time you mailed it to the Secretary, was it?

Admiral SIMS. Prior to the time?

Senator PITTMAN. Yes.

Admiral SIMS. After the time.

Senator PITTMAN. After the time?

Admiral SIMS. After the time.

Senator PITTMAN. That you mailed it to the Secretary?

Admiral SIMS. I must have mailed it immediately after its own date, probably the 8th or 9th, or something like that.

Senator PITTMAN. At a dinner at Mr. Davison's house?

Admiral SIMS. No; in his private study. I was a guest at his house, and spent the night there.

Senator PITTMAN. Who else was there?

Admiral SIMS. There was another man in the house and his family, and his son, and so forth; but I can not remember anybody else, and it was only shown to him.

Senator PITTMAN. You can fix that date, can you?

Admiral SIMS. I can fix the date, easily.

Senator PITTMAN. Will you fix the date before you leave here?

Admiral SIMS. I will try to. I can find out about it. I may have to write to Newport and get the correspondence; but it was about the middle of January.

Senator PITTMAN. About the middle of January?

Admiral SIMS. My aid thinks it was the 14th, but I can not be sure. It is easily fixed because of the date of that dinner, you see.

Senator PITTMAN. On the 14th of January an article appeared in the Washington Post under the signature, or the name, rather, of Mr. Albert W. Fox, entitled "Sims attacks Daniels's policies. Army medal inquiry by the House. Admiral again writes frank criticism to the Secretary. Sees Navy's morale hurt. Fearless exposé of what he believes blunders and mistakes. Expected to bare conditions":

Secretary Daniels has received another letter from Admiral William S. Sims, which will prove of great interest to the service and the country if the Secretary does not succeed in suppressing it. It is a frank and fearless exposé of the hopeless story of maladministration, mistakes, and blunders into which the American Navy has fallen as a result of Mr. Daniels's policies, and it tells the Secretary things that became evident to the admiral during the war, and are even more evident now.

It is, in effect, an attempt by the officer who was commander in chief of the American naval forces in European waters during the war and is perhaps foremost among ranking officers in the service to rescue the morale of the United States Navy from the Daniels policy by appealing directly to the men responsible for it all.

Admiral Sims is now president of the Naval War College at Newport, R. I., and the letter was sent to Mr. Daniels from there.

* * * * * * *

If this officer, who is generally regarded here and abroad as one of the most competent naval authorities in the world, finds it necessary to expose Mr. Daniels's management of naval affairs and frankly and fearlessly undertakes the task it is not probable that senators will show lack of interest.

Every one admits that there is something vitally important to the Nation involved in naval efficiency or inefficiency and the big, broad question at issue is how Mr. Daniels's policies are affecting the service.

That is on the 14th day of January. I will ask you if you saw any publication in regard to that testimony of yours prior to that time.

Admiral SIMS. I do not understand your question.

Senator PITTMAN. I ask you if you saw any publication intimating that there was such a letter as that, prior to the morning of the 14th day of January?

Digitized by Google

Admiral SIMS. Prior to that time?

Senator PITTMAN. Yes.

Admiral SIMS. Not that I recollect. I understand there was a squib in the papers; but I only found it out before I came down here to this investigation.

Senator PITTMAN. I would be very glad if you would have some of your convolutions hunted up in regard to this matter.

Admiral SIMS. In regard to what?

Senator PITTMAN. In regard to this matter. This is the first mention we have heard of this—have been able to find.

Admiral SIMS. Probably that is the first. I think that is the first.

Senator PITTMAN. I would be very glad to have you pursue it in any manner you can.

Admiral SIMS. I did not follow that carefully.

Senator PITTMAN. Because it would indicate great carelessness on our part.

The Post of January 15 has something else about this; not by Mr. Fox, however.

It is headed "Daniels mum on Sims. Stopped reading letter just when it became 'critical.' "

Then the article goes on:

Secretary Daniels admitted yesterday that he had received a "critical" or "controversial" letter from Admiral Sims, but said he had not yet read all of it. He stopped reading it just as it was becoming critical, he explained, and therefore could not comment on the charges against his management of naval affairs made by the admiral.

Then there is something else down here in the same article:

NEW POINTS MAY BE DEVELOPED.

Besides getting Admiral Sims's views on the actions of Secretary Daniels in the matter of naval awards, which the admiral has described as bringing condemnation and ridicule upon Mr. Daniels and the service and lowering the morale to the last degree, it may be that the committee will develop points having an important bearing on the present condition of confusion and chaos in the Navy.

It seems that some one was wise at that time.

Now, then, here is an article from the New York World under date of January 15, 1920, sent from Washington. The heading reads:

Sims writes long letter to Daniels criticizing Navy. Communication discusses "Lessons of the war." Secretary has no comment.

Then the article says:

Admiral Sims has been called to appear before the subcommittee of the Senate Committee on Naval Affairs Friday in connection with the committee's investigation of the award of decorations to officers and men of the Navy.

MAY CRITICIZE MISTAKES.

There are intimations that Admiral Sims on that occasion may discuss the Navy in general, the mistakes made during the war, causes for the present low state of morale, etc.

Secretary Daniels indicated to-day that he may have nothing to say regarding Admiral Sim's communication until after the admiral has had an opportunity to lay his views before the committee, should he desire to do so.

Asked whether the letter is "critical" of his policies and management of the Navy, Mr. Daniels said that the portions he had read were rather critical.

"If he (Admiral Sims) has given it out as being critical, I suppose the letter is critical," said Mr. Daniels.

* * * * * * *

Digitized by Google

Those portions of the letter which Mr. Daniels has read contain no mention of the award of decorations which Admiral Sims criticized severely in a letter made public by Mr. Daniels some time ago.

There is a similar statement in the New York Times.

So that the first intimation made public was in the article of Mr. Fox in the Washington Post on the morning of January 14.

Admiral SIMS. Are you asking a question?

Senator PITTMAN. No; I am just stating a fact first, and then I wish to comment on it.

Admiral SIMS. Yes, sir.

Senator PITTMAN. The article purports to know the general tenor of that letter. It suggests that that may be made public unless Secretary Daniels suppresses it.

These other articles written by Washington newspaper men indicate that the Secretary was suppressing, and would not even discuss it. So much for the inference in this article, and also your testimony, that the Secretary was responsible for you placing that letter before the public through the medium of this committee.

Now, as to the inference that you were forced to produce this letter by the committee——

Admiral SIMS. Yes; will you allow me to make some comment upon what you have just been reading? You did not ask me any question about it.

Senator PITTMAN. No; because I want to connect it up with the hearings, and then let you answer it all at the same time, if you will.

Admiral SIMS. Oh, that is all right.

Senator PITTMAN. It will be better, and it will be more intelligible.

Admiral SIMS. That is all right, sir.

Senator PITTMAN. Now, then, as to the reflection upon the committee, that this committee here forced the letter out into public.

Admiral SIMS. Who made this reflection?

Senator PITTMAN. That reflection is carried in this article that I have read; and not only that, but I take it that it is carried in your testimony when you state here——

Admiral SIMS. I did not use any such expression as "forced." I said that it was asked for by the committee.

Senator PITTMAN. Yes. Well, if you do not want to use that word, that you were compelled to present it, I am perfectly willing, that you did not.

Admiral SIMS. Did I use it?

Senator PITTMAN. Well, were you compelled to present the letter by the committee?

Admiral SIMS. I was asked for it, and I presented it. I understand so.

The CHAIRMAN. Senator Pittman, in quoting Admiral Sims if you will stick to the record and quote him from the record and not from what you think he said, you will have less trouble.

Senator PITTMAN. The Admiral is here, and he is just as bright as the Chairman.

The CHAIRMAN. Nobody can remember what was said exactly. You have the record before you to quote from.

Senator PITTMAN. Possibly no one but the Admiral can.

The CHAIRMAN. I do not think we need any discussion ot the matter.

Digitized by Google

Senator PITTMAN. No.

The CHAIRMAN. Nor will we have it.

Senator PITTMAN. No; I do not intend to stand for it. I am conducting this cross-examination.

The CHAIRMAN. And when it is not being properly conducted, I shall interfere, right along.

Senator PITTMAN. And I shall pay no attention to it.

The CHAIRMAN. We will not proceed.

Senator PITTMAN. I realized this morning that you were going to try to break up this cross-examination.

The CHAIRMAN. There is no attempt in any way to break up the cross-examination. Now, go on.

Admiral SIMS. May I say now, in reference to this, that I welcome this cross-examination, because if you continue it through my testimony, I believe it will be the means of bringing out possibly information that I did not bring out. Naturally, I want to bring out everything I can.

Senator PITTMAN. I will help you, Admiral.

Admiral SIMS. I am trying to help the department. I want it understood that as I made this statement from day to day, I passed it in to everybody on the other side, including the Secretary of the Navy. I want the whole thing to be brought out, and I am here to help you.

Senator PITTMAN. Now I want to know whether or not you were compelled to produce that letter by the committee.

Admiral SIMS. I understand that a request made by a committee of the Congress for testimony compels you to give it.

Senator PITTMAN. Admiral, if there were a matter within your knowledge, or any letter that you had written that you would consider that the publication of the same would be injurious to our vernment, would you publish that, simply upon the request of neone who did not know its contents, without suggesting that it tained matter that might be prejudicial to our government?

lmiral SIMS. Certainly not; I would submit it to the committee d closed doors. But when it is something that I know will be nely beneficial to the Government, I do not think that procedure is necessary at all.

Senator PITTMAN. I see. That answers my question exactly. You would have submitted it behind closed doors if you had not considered that it was very beneficial; and therefore you did not suggest to the committee that they consider it behind closed doors?

Admiral SIMS. I did not. It was not any of my business to.

Senator PITTMAN. You made no intimation to the committee that there was a statement in there that might be offensive to another Government?

Admiral SIMS. No.

Senator PITTMAN. Did any member of this committee know what was in that letter?

Admiral SIMS. Nobody except the people you have mentioned there, to the best of my recollection, knew anything about the letter at all.

Senator PITTMAN. Yes.

Admiral SIMS. Or, certainly, not what was in it.

Digitized by Google

Senator PITTMAN. Yes. You had the letter in your pocket at the time, did you not?

Admiral SIMS. I had carried it in my pocket ever since the original was submitted. It never was out of my possession.

Senator PITTMAN. At the time this letter was presented, you were testifying in a proceeding dealing with naval awards, and the chairman stated to you this, and I call your particular attention to it so that you can determine whether he was referring to the letter in your pocket. I admit I did not know he was referring to the letter in your pocket. [Reading.]

The CHAIRMAN. Admiral Sims, I think in connection with this matter if you have had any further correspondence with the Secretary of the Navy about the question of awards and their effect on the morale of the service, it would be well for you to give that correspondence to us at the present time.

Admiral SIMS. Will you read my reply?

Senator PITTMAN (reading).

Admiral SIMS. It does not bear particularly upon the question of the awards, but it does bear upon the question of the morale of the service.

The CHAIRMAN. Then I think it is decidedly germane to the issue.

Admiral SIMS. As I said before, the action of the Board in the awards is only the last straw in this whole business.

Senator PITTMAN. May I finish this line of examination with regard to this particular subject?

The CHAIRMAN. If the admiral has expressed himself in regard to this matter in any letter that will throw light upon the subject, we should have it.

That subject was the subject of naval awards. [Continuing reading.]

Senator MCCORMICK. My sentiment is that we should give the admiral an opportunity to furnish us these letters before we get too far away from the subject to which they refer.

Senator PITTMAN. It seems to me the admiral has had plenty of opportunity to put anything in this record he desired to insert. I am not making any objection to it, but I have started an inquiry right now with regard to the difference of opinion.

Then the chairman goes on again:

The CHAIRMAN. Now, Senator Pittman, with your permission we will go ahead with the question I put to the admiral, if the admiral cares to proceed.

That is the history of the way this matter became public. That is the history of the way the committee is alleged to have forced it from your possession.

One other question along this same line, and then I will let you answer it all, so as to connect it all up. Prior to January 6 you wrote a letter, and made it public, with regard to naval awards, did you not?

Admiral SIMS. No, sir.

Senator PITTMAN. You did write a letter with regard to criticising the naval awards?

Admiral SIMS. But I did not make it public.

Senator PITTMAN. What date did you write that letter?

Admiral SIMS. It was dated the 17th of December. The date is in the record. Have you a copy of the printed hearings on naval awards? You will find it in the record there.

Senator PITTMAN. I think that is near enough—the 17th of December?

Admiral SIMS. Yes.

Digitized by Google

Senator PITTMAN. That was written from Newport?

Admiral SIMS. Yes.

Senator PITTMAN. Did you show that letter to anyone?

Admiral SIMS. Oh, yes; I consulted a good many people there about it, because it concerned those officers there so intimately, and I sent copies to a certain number of officers who were concerned, that is to say to officers that I had recommended for a certain decoration and who had only got another one. I wanted those officers to know what I had done about it.

Senator PITTMAN. You had that letter mimeographed?

Admiral SIMS. I had the letter mimeographed in order to send it to the officers concerned.

Senator PITTMAN. There were quite a number of the officers that you considered concerned, I suppose?

Admiral SIMS. I sent out, I suppose, a couple of dozen copies.

Senator PITTMAN. Then it found its way into the press?

Admiral SIMS. I do not know how it found its way into the press.

Senator PITTMAN. It is just as much a mystery as how Fox got his information.

Admiral SIMS. I know how Fox got his knowledge about it, but you have not asked me any questions about that.

Senator PITTMAN. I will ask you how Mr. Fox got the knowledge about the letter?

Admiral SIMS. I considered those letters you have read there from the press a very distinct tribute to the enterprise of the press in getting that information.

Senator PITTMAN. You said you knew who gave Mr. Fox the information.

Admiral SIMS. Do not be impatient, and I will tell you. I did not say I knew who gave Mr. Fox the information, but I said that I had been told that—I could tell you how Mr. Fox got the information; and I have been told—I have not seen him at all since I have been in Washington but I have been told that Mr. Fox got the information in the usual way from the Navy Department. Now, let me——

Senator PITTMAN. You have been told that?

Admiral SIMS. Yes; I have been told that.

Senator PITTMAN. I wish you would tell me who told you that.

Admiral SIMS. I could not tell you who told me, but some one came into the room where we had a number of people and said that was what Fox said, and you can easily ask Fox, if you want to.

Senator PITTMAN. I probably will.

Admiral SIMS. Let me tell you something. I went into the Navy Department on the 17th of January and I found copies of that letter you are talking about now, of January 7, in the Navy Department. It had been recopied, and it was there. You can not recopy a thing without somebody copying it. I know there were a number of copies gotten out and passed around the Navy Department. One minute; let me finish. I know that a letter that comes into the Navy Department is seen by a good many people before it is ever placed before the people who have to consider it. The ordinary procedure is for a letter to come to the file room, and there it is read by a clerk who makes on a yellow card a sufficient abstract so that you can recognize it—what is in it—and gives it a number, etc., and puts it in the proper basket, and it goes through. Anything that comes into the Navy

Digitized by Google

Department is known to a number of people. If any one of those people wants to tell a newspaper man on the outside about it, he can do it. He ought not to, but it is very frequently done, and I understand that that is where this information came from—out of the Navy Department, where a great deal of other information of a similar character does come out.

Senator PITTMAN. Now, you say——

Admiral SIMS. But let me make this statement first.

Senator PITTMAN. Certainly; go right ahead.

Admiral SIMS. But nothing that I did, nothing that any of the officers in my entourage in Newport did, had anything to do in any possible way with the giving out of the fact that there was such a letter, let alone giving out the contents of the letter itself.

Now, the game was played perfectly fairly and squarely. I am no spring chicken in this business, and I am not putting my head into a noose unnecessarily. I saw that the letter was confidential, of course, and I took particular pains to see that it did not get out to any of our own people, and I even carried the only copy in my own pocket, so that I would be able to say that it was always there, and be sure that it was there; and I had it in my own pocket when I came down here.

Senator PITTMAN. When was it you say you were in the Navy Department and saw a copy of that letter?

Admiral SIMS. The same day I read it to you.

Senator PITTMAN. Before or afterwards?

Admiral SIMS. Directly afterwards.

Senator PITTMAN. Yes; I thought so.

Admiral SIMS. Directly after that.

Senator PITTMAN. Yes; directly after that?

Admiral SIMS. Yes; but it was only about two hours afterwards. The morning of Saturday that I read that letter here, the 17th of January, I received a telephone message while I was in the room here that the Assistant Secretary of the Navy wanted to see me that afternoon at half past 2, and I went down there, and I knew then, he told me, that the letter had been copied and circulated, and he showed me one on his desk.

Senator PITTMAN. Yes; he showed you one on his desk. To whom did you address that letter?

Admiral SIMS. To the Secretary of the Navy.

Senator PITTMAN. The Secretary of the Navy?

Admiral SIMS. That is, under the regulations, to address a letter to the Secretary of the Navy, and if it wants to go to a bureau, you put in parentheses "Bureau of Navigation," or "Bureau of Ordnance," or whatever bureau it may be.

Senator PITTMAN. And on the 14th Mr. Fox not only knows of the existence of a letter of that kind, but he has given a very accurate description of the general subject matter.

Admiral SIMS. I noticed that; yes. Now, you are trying to fix that on me, as to my giving it out. I tell you I had absolutely nothing to do with that.

Senator PITTMAN. I am not trying to fix it on you as to giving it out.

Admiral SIMS. What are you trying to do, then?

Digitized by Google

Senator PITTMAN. No, no, no; far be it from me to try to fix anything on you.

Admiral SIMS. Well, cheer up; I am glad to know that. Go on.

Senator PITTMAN. But you, you see, got a little confused in your testimony when you testified so rashly here a while back with regard to the possession of this letter, and it now develops that you let Mr. Davison in New York, who was a civilian, read that letter before you put it in the record.

Admiral SIMS. Yes; that is right.

Senator PITTMAN. Before you made it public.

Admiral SIMS. No; I did not make it public. I showed it to Mr. Davison, that is all. He is an honorable man, and you can call him before this committee and he will tell you that he did nothing with it. That was an indiscretion. I have said so. You do not need to pound away on that. I acknowledge that thing.

Senator PITTMAN. I am very glad you acknowledge that. Now then, another thing; you were complaining that we are trying to pin something on you——

Admiral SIMS. Oh, I was not complaining at all.

Senator PITTMAN (continuing). You stated in your testimony presumably the letter was called out because the department had published the fact of its existence and its general nature. Now, as a matter of fact, is there any evidence here that the department had published its existence and its general nature?

Admiral SIMS. That is what I thought at the time; but I told you a little while ago that I was mistaken, and did not find that out until I came here and found those articles. I do not take the Washington Post, and I had never seen those articles you have read here, and I did not know about it; that is all. What I was referring to at the time was this, that I supposed that in the interview that takes place daily with the press and Mr. Daniels somebody on the press asked him about this. I have since been told, but I have not verified it, that the day before that thing there was a little squib in the newspapers saying that the letter had been received; but I did not know it when testifying. I did not know it until I came down here this time and somebody told me about it. [Reading:]

Presumably the letter was called for because the department had published the fact of its existence and general nature.

That is in my preliminary statement. There was a published interview in the paper with Secretary Daniels, in which they asked him about the letter, and he said, "Yes; there was a letter of a critical nature."

Senator PITTMAN. When was that?

Admiral SIMS. I do not remember when it was.

Senator PITTMAN. I have read when it was. It was subsequent to the Fox article.

Admiral SIMS. That is an attack on the Secretary of the Navy. I haven't got anything to do with that.

Senator PITTMAN. I say, the first notice of that was the Fox article. I presume that is connected with the leak, all right.

Admiral SIMS. That is something that concerns Mr. Fox and not me, because you said you were not trying to pin it on me and it does not concern me.

Digitized by Google

Senator PITTMAN. It certainly, though, affects the Secretary of the Navy.

Admiral SIMS. Yes.

Senator PITTMAN. And by reason of the fact that you had publicly given the testimony you did here, which is a direct reflection that he gave publicity to it.

Admiral SIMS. Why should they not give publicity to it?

Senator PITTMAN. For the simple reason that it contained matters that were offensive to a Government which we were at peace, and on friendly terms; because it contained a communication that was a voluntary statement that was confided to a high admiral, in strict confidence.

Admiral SIMS. It was not in strict confidence.

Senator PITTMAN. In such confidence that it was not even transmitted in writing.

Admiral SIMS. It was not in confidence. It was before other officers.

Senator PITTMAN. Why Admiral, it was before the three men that have charge of matters of that kind.

Admiral SIMS. Excuse me, sir; it was in an office where there were a number of people. The second day it was stated to me——

Senator PITTMAN. The second day it was before naval officers?

Admiral SIMS. It was.

Senator PITTMAN. Before naval officers, who are supposed to respect the confidence that is reposed in them by superior officers, and who would hold sacred a secret of the navy that was essential to the protection of the Government.

Admiral SIMS. It was not told to me in that way, at all.

Senator PITTMAN. And you do not consider that the making public of such statements as that would be improper?

Admiral SIMS. For who to make it public?

Senator PITTMAN. Anyone.

Admiral SIMS. No; I do not.

Senator PITTMAN. You do not?

Admiral SIMS. No, I do not, where the interests of our service are at stake. We naval officers have made up our minds to one thing, and that is this, that we will never go into a war in that condition in which we went into this. Do not make any mistake about that?

Senator PITTMAN. That statement is all right, and I accept your statement also with regard to what you consider the duty of a high naval officer. That is all I have to ask you on that subject.

Admiral SIMS. Are you asking a question?

Senator PITTMAN. No, sir, I am through now on that. That is the end of that subject. There is another subject that I want to take up.

Now, Admiral, part of your criticism involved in this matter has been the lack of centralization of command in London.

Admiral SIMS. The lack of what, sir?

Senator PITTMAN. Of command.

Admiral SIMS. The lack of centralization, you said?

Senator PITTMAN. Yes, the lack of centralization of command in London. Is that not true?

Digitized by Google

Admiral SIMS. No, I do not recall any such criticism. The command abroad was centralized in London perfectly, with the initiative to the subordinate commanders. I think we may misunderstand each other about the significance or drift of that question. Perhaps you will modify it a little.

Senator PITTMAN. Yes; I probably will. Now in letter No. 27, under date of July 16, 1917, from Vice Admiral Sims to the Secretary of the Navy, subject, concerning policy of United States naval cooperation in war and allied subjects, I read from paragraph 3:

3. The first course open to us which naturally occurs to mind is that we should look upon our service as part of the combined allied service, of which the British Grand Fleet is the main body and all other allied naval forces disposed throughout the world as necessary branches thereof.

On November 15, 1917, in a communication to the Secretary of the Navy by you, and called a general report, I read the following extracts from paragraph 11:

From the American point of view it appears necessary to accept as a fact that an increasing amount of American tonnage must be contributed to support the Allies entirely outside of the demands of our military and naval forces. If this is accepted, it appears that the extent of our military participation is only dependent upon the rate of American shipbuilding, and that our military participation must be viewed with great anxiety until the rate of production of new tonnage commences to exceed the losses. It has even been suggested that in view of the present situation a good proportion of our national army could perhaps be more efficiently utilized in prosecution of the war by actually utilizing it as labor in American shipyards.

I now read a communication from Admiral Sims to Admiral Bailey, under date London, January 24, 1918.

Admiral SIMS. To whom?

Senator PITTMAN. Admiral Sir Lewis Bailey, of the British Admiralty.

Admiral SIMS. Yes.

Senator PITTMAN. I may state that this letter comes from your historical section at London.

You will be interested to know that the question I mentioned to you about the best way to use the man power of America on the western front is now up for very serious consideration. It has evidently been presented on the other side with very great force, because the chief of our war staff, who has recently passed through London and who is a member of the Allied War Council, is of the opinion that we should utilize this man power in the way indicated in our discussion when I was at Queenstown. He believes that if we persist in the original scheme of organizing a large army based upon new ports, with adequate means of transportation, and so forth, that our army could not be made effective until 1919. The whole matter will come before the Allied War Council and be considered by the prime ministers of the countries most concerned and doubtless a decision will be forthcoming before long. I don't see how this decision can be anything much different from what we believe it should be.

In this connection, if the decision is made as indicated above, it will change to a certain extent the employment of our various groups of destroyers. According to the general, the scheme would be not to proceed with the development of the facilities in the ports on the west coast of France but to let them remain as they are and to use these ports for the supply of the troops already in there and for the supply of their reinforcements, and to divert the tonnage which is now carrying in all equipment and installation for handling a big army to the bringing of troops in to the western ports of the British Isles in order that they may be passed through the British camps to the western front.

If this is the decision, it will mean that there will be few army convoys going into the west coast of France, and consequently that these can be handled only by the destroyers now based on France with the possible addition of a certain number from Queenstown.

Digitized by Google

On the other hand, there would be more troop convoys coming in either to the north or the south of Ireland, and provision would have to be made to escort these additional convoys. However, this is a bridge that does not need to be crossed until we get to it.

Admiral SIMS. That is a dandy letter, all right. I am proud of it.

Senator PITTMAN. Now, Admiral, I will ask you about this——

Admiral SIMS. I should like to explain that to you.

Senator PITTMAN. I will ask a few questions, and then you can explain all of it.

Admiral SIMS. Yes.

Senator PITTMAN. What was the question that you mentioned to him about the best way to utilize the man power of America on the western front?

Admiral SIMS. I was reporting to him what Gen. Bliss had told me, and what he told me he was going to put up to our Government when he went back, that until we could get a large number of troops in there and until we could put them through a long series of training so that they would be capable of taking over a whole section on the western front themselves, what would help to win the war the best at that time would be to do what the British were doing with their own raw troops that they were putting in there, and what Napoleon did with his troops throughout his whole career. That was, when he got a new contingent of raw recruits, instead of making an army out of them and putting them through from 6 to 8 or 10 months' drill to fit them to go into battle by themselves, he put them in small groups, in among the veterans on each side of them, so that they could be guided by the veterans among whom they were placed, which would fit them for fighting inside of two months; and I am very glad to say that the ideas of Gen. Bliss on the subject prevailed, and that the American army did do that exact thing at the time that he was talking about, and they put them on the western front in among the British, who spoke the same language, and they fought alongside the British, brigaded with them, as the expression is, a group of Americans with a group of British on each side, and so on, and they did most excellent service, and you probably remember that when they were put in under Gen. Haig to fight alongside of the Australians, when somebody asked the Australians how these raw American troops did, the reply was that they did first rate, but they were a little bit rough.

Now, that was what Gen. Bliss had recommended, and that is what I was talking about there, and that was a wise thing to do, as Gen. Bliss saw, and when he got back he proposed to our Government to that effect, and that is exactly what they did. Later, when they had so many troops in there that they constituted an army, after those fellows had gotten a good deal of experience, after those troops had fought under Gen. Haig, a certain number of them were withdrawn to form the nucleus of the army of the Argonne, and so forth. It all went forward as projected there.

Senator PITTMAN. So, on November 15 you were in favor of putting our soldiers to work in the navy yards as laborers, and on January 24 you were in favor of brigading our soldiers with other troops?

Admiral SIMS. At a certain time I was in favor of putting a certain number of them in the ship yards, in the same way as the British did, in order to get the tonnage. We all realized, and Gen. Pershing did,

Digitized by Google

and whenever you are ready to hear about that I will tell you what he had to say on the subject, that the tonnage question was the very basis of the whole business, and if that was not solved the war could not possibley be won with the assistance of the American Army. Therefore it was necessary, not to take all the men who were enlisted for the Army and put them in the shipyards, but to take what were necessary in order to solve this tonnage situation. Great Britain proposed to do it and did do it. She withdrew men from her veteran army who were shipwrights and put them in her shipyards. That is all that was. It was simply to accentuate the fact that instead of putting into the Army men who were shipwrights, who understood how to build ships, it was so essential at that time that we have ships in order to get the Army over and to get the supplies over, that these men, instead of going into the Army, should have been employed in the shipyards. That is only ordinary American common sense.

Senator PITTMAN. Was Gen. Pershing, on January 24, favoring a separate American unit over there, or was he favoring your proposition of putting them under the British?

Admiral SIMS. I do not know.

Senator PITTMAN. You really do not know that?

Admiral SIMS. I do not know that. I do not know when he came out, but I know that he did come out and say, "I am willing to brigade my troops in any possible way." He said that at a certain date, but when he had the original idea I do not know.

Senator PITTMAN. When did you come out openly for a separate Amreican unit over there?

Admiral SIMS. I did not come out for it. It was none of my business and I did not come out for it, officially or in any other way. I naturally discussed it with Gen. Bloss when he came through there, and when I saw him on the Allied War Council at Paris, naturally those things were discussed with him, and he agreed that he would advise them when he went back, and he told me that when he came back to America he did so advise our Government at that time. It was not a question of brigading our troops with foreign troops at all times; it was only to get over an emergency. We would have to go into a great deal of testimony in order to establish all the facts in a case of that kind; but what I was advocating, or talking about in my letter to Admiral Bayly was what Gen. Bliss had told me was the decision of the Supreme War Council. That is to say, the Army people that discussed the whole matter thought that it was necessary at that time to put the troops in, and did put them in, and it succeeded admirably.

Senator PITTMAN. Now I read another paper from your historical section—

Admiral SIMS. Will you allow me to say also that in no case should it be considered that I, a naval officer, attending to my own business, was recommending anything at all. I wanted to know what they were going to do, because it might have a marked influence on how my forces should be handled. If they should decide, as they did later, to send a large body of troops through Great Britain, it would affect the disposition of my forces, in order that those things should be properly transacted. In the later period of the war, when the crisis came, it was found that this advice about sending them through Great Britain was exceedingly important, and when the

Digitized by Google

rush came, after March 21, 1918, from that time on—I just make a rough guess that 50 per cent of the troops went into Great Britain and across the channel; so that all those things that I discussed with Gen. Bliss—not recommending them but trying to find out about them—were all done exactly as explained in that letter to Admiral Bayly; and we, as two sailormen, were discussing what would be the disposition of the forces that were escorting the troops, in case that did come off. I am pleased to death with that letter, and I am glad I wrote it.

Senator PITTMAN. Here is another statement, Admiral, sent over by your historical section in London at the same time with this letter, to the archives here:

There was a small dinner last night at which were present Balfour, Cecil, and Reading and the host, a very important person.

Admiral SIMS. Balfour, Cecil, Reading, and who else?

Senator PITTMAN. Balfour, Cecil, Reading, and the host, a very important person.

There was also present another man who holds somewhat radical views as to the most efficient way to employ America's man power on the western front, instead of organizing a separate Army with its own lines of communication and supply.

The gentlemen above mentioned were greatly interested in the expression of these views and highly approved of them and the discussion turned upon the means to be employed to realize them.

During the discussion the following facts were brought out:

First. This proposition was presented by the House mission upon its return home.

Admiral SIMS. Gen. Bliss was with the House mission.

Senator PITTMAN. (reading):

Second. The President asked Pershing for his views as to the advisability of the scheme, and, in case he did not approve of it, to state why he did not approve.

Third. Gen. Robertson went to France to discuss the matter with Pershing, and came back "much disappointed."

Manifestly, the pressure in favor of the scheme is increasing. It is becoming apparent that the bulk of the tonnage assigned to transport the Army is being used to bring over the material to create the facilities for handling and supplying a projected army so large that it can probably never be landed in France—at least not in time to get into the game.

It is believed that the pressure is now, or soon will be, such as to endanger the positions of those who continue to oppose the scheme.

It is, of course, desirable to increase this pressure as soon and as much as possible.

The reasons in favor of the scheme are so plain and simple as to be readily understood by the man on the street.

The reasons opposed to it are purely sentimental—national and state pride, and ambition for personal distinction. There is no sound military reason against it.

Therefore, it is of the first importance that this matter be clearly explained to the man on the street.

It is up to you and the men of your cloth.

Admiral SIMS. What is the date of that?

Senator PITTMAN. January 14, 1918.

Admiral SIMS. From whom?

Senator PITTMAN. It says, "Admiral Sims's personal file."

Admiral SIMS. Who wrote it?

Senator PITTMAN. I am asking you who wrote it.

Admiral SIMS. I am asking you who wrote it.

Senator PITTMAN. I have not the slightest idea. It is in your personal files.

Admiral SIMS. Then I have not anything to say about it. It may be a paper in my personal files, but if you want to question me about a paper that you read to me you must tell me who wrote it.

Digitized by Google

Senator PITTMAN. It came with the Bayly letter, which is dated January 24, 10 days after this memorandum.

Admiral SIMS. I can not comment on it. Is it a letter?

Senator PITTMAN. The Bayly letter is a letter. This is dated January 14, 1918, and is marked "Admiral Sims's personal files. Memorandum."

Admiral SIMS. There were 50,000 papers in among those things, and if you will not tell me what it is about I can not comment on it.

Senator PITTMAN. If you do not know what your historical section had——

Admiral SIMS. Of course I do not know. They sent over to me and told me to send over all the stuff we got there, and it is up to them to sort them. I do not know what this is. That is not my files. That is the Navy Department historical files.

Senator PITTMAN. Very well. I call your attention to the fact, however, Admiral——

Admiral SIMS. Evidently it is somebody writing to me his opinion.

Senator PITTMAN. No; Admiral——

Admiral SIMS. It is not mine, evidently.

Senator PITTMAN. It seems to be so in accord with your letter to Admiral Bayly——

Admiral SIMS. Oh; most people were in accord with me. That is the reason I got along so well. I did not write that, and I do not know who did.

Senator PITTMAN. I enjoy affording you amusement. I am going to afford you some more amusement now. This letter of Bayly's——

Admiral SIMS. Let me state that——.

Senator PITTMAN. Just a minute. I am asking you a question.

Admiral SIMS. I only want to say that the probability is that that was a memorandum sent me for my information by Dr. Page, the ambassador, himself.

Senator PITTMAN. By Dr. Page?

Admiral SIMS. By Dr. Page, the American ambassador.

Senator PITTMAN. Did you discuss these matters with Dr. Page very frequently?

Admiral SIMS. No; I saw him very rarely about those things. I only went to see him when I wanted help from him.

Senator PITTMAN. Do you mean to say Dr. Page would send you a memorandum of this kind in the nature of propaganda?

Admiral SIMS. Not in the nature of propaganda, but for my information.

Senator PITTMAN. Admiral, it is evident that this is intended as British propaganda to be used against the effort of Gen. Pershing to establish a separate army.

Admiral SIMS. Gen. Pershing at that time, or a little while after, announced himself in favor of brigading those troops in England, until the army was fixed up, and they did exactly what is recommended there.

Senator PITTMAN. You say on January 14——

Admiral SIMS. No; I do not say on January 14, and I did not say that. I said before I did not know what date it was, but I do know that when the crisis came he came out in the most splendid way and said, "I am willing to brigade my troops in any way that will help along the allied cause."

Digitized by Google

Senator PITTMAN. This memorandum says, "The reasons opposed to it are purely sentimental—national and State pride, and ambition for personal distinction. There is no sound military reason against it." This is a propaganda against the establishing of a separate American unit. Whether it was written by you——

Admiral SIMS. It was not written by me.

Senator PITTMAN. Or by Dr. Page to you, do you think Ambassador Page would engage in such propaganda?

Admiral SIMS. I absolutely object to calling that propaganda. It is perfectly good, sound military sense that at the crisis those things should be put in there. Of course, you had to put them in against personal ambition and all that sort of thing. It is exactly what was eventually done. It was a perfectly sound military reason, and it was what Gen. Bliss recommended, and it is what Gen. Pershing eventually did when the crisis came. That is not propaganda. That is ordinary, plain, common military sense, that is all.

Senator PITTMAN. I am glad you view it in that light, because it will connect up your actions later on very admirably.

Admiral SIMS. I can tell you one thing. I do not know who wrote that paper, do not know anything about it at all, so what is the use of my trying to discuss a paper I do not know anything about?

Senator PITTMAN. I am very pleased to know that you approve of it.

Admiral SIMS. I did not say that I approved of it at all.

Senator PITTMAN. It is practically your point of view.

Admiral SIMS. Then I absolutely deny that I approved of it. I have not anything to say about that paper at all, except that it predicts exactly what took place. It is not up to me as a sailorman to approve of military procedure at all. All the expressions of opinion I made on the subject were repetitions of what had been said by Gen. Bliss, who was a soldier, and who had just come from consultation with Gen. Pershing and Foch, and so-and-so in the Supreme War Council, and I simply discussed this thing with Admiral Bayly and Admiral Jellicoe, and so forth, to see what our disposition would be. That simply predicted what would have to take place in order to win the war, and it did take place, so what is the use fooling about it?

Senator PITTMAN. I am very glad to know you approve of this propaganda.

Admiral SIMS. You can keep on saying I approve of it, and you can keep on calling it propaganda, but that does not make it so.

Senator PITTMAN. I simply accept your first testimony instead of your last, just as I have done several times.

Admiral SIMS. Oh, well——

Senator PITTMAN. Now, I want to insert in the record here without reading again—and my purpose in inserting it is this——

Admiral SIMS. Before you leave that subject, Senator, I note that in reading from the letter of November 15 you quoted a paragraph in which it is said, "If this is accepted, it appears that the extent of our military participation is wholly dependent on the rate of American shipbuilding, etc." I simply refer to that to identify the paragraph. That is taken out of the letter after the following paragraph:

Digitized by Google

Although it is difficult to obtain accurate figures of current production of new tonnage of both the United States and England, it appears in round numbers that the October losses are at a rate not far from double the rate of production. This means that if the present rate of loss continues the curve of available tonnage is on the down slope at a dangerous angle, and the present estimate for future production of new tonnage in England indicates that, on the most optimistic basis, a rate of 250,000 tons per month will not be reached in less than a year and only then provided the United States can assist by supplying a portion of the necessary steel, particularly plates. This indicates that until the United States production of new tonnage can be brought to the rate of 300,000 to 400,000 tons a month the existing tonnage will continue to decrease.

Now, this tonnage situation was the gist of the whole thing. As I have explained in my testimony, the hope of victory on the part of the enemy was that he could cut the lines of communication. The business of the allied navies was to prevent that and to preserve the lines of communication, and Gen. Pershing understood that thing perfectly. I would like to read this extract from Gen. Pershing's report to show how solicitous he was in that matter. [Reading:]

MILITARY SITUATION, 1915 (P. 7).

Although the British Fleet has established its superiority on the sea, yet the German submarine blockade had developed into a serious menace to allied shipping.

MILITARY SITUATION, SPRING OF 1917.

In the five months ending June 30 German submarines had accomplished the destruction of more than three and a quarter million tons of allied shipping. * * * Her battle lines were held on foreign soil and she had withstood every allied attack since the Marne. * * * It can not be said that the German hopes of final victory were extravagant, either as viewed at that time or as viewed in the light of history. Financial problems of the Allies were difficult, supplies were becoming exhausted, and their armies had suffered tremendous losses. Discouragement existed not only among the civil populations but throughout the armies as well. * * * Such was the allied morale that, although their superiority on the western front during the last half of 1916 and during 1917 amounted to 20 per cent, only local attacks could be undertaken and their effect proved wholly insufficient against the German defense. Allied resources in man power at home were low and there was little prospect of materially increasing their armed strength, even in the face of the probability of having the whole military strength of the Central Powers against them in the spring of 1918.

8. Such was the state of affairs that existed when we entered the war. While our action gave the Allies much encouragement, yet this was temporary, and a review of the conditions made it apparent that America must make a supreme material effort as soon as possible. After duly considering the tonnage possibilities, I cabled the following to Washington on July 6, 1917:

"Plans should contemplate sending over at least 1,000,000 men by next May."

TONNAGE REQUIRED FOR UNITED STATES ARMY (P. 10).

The complexity of trench life had enormously increased the tonnage of supplies required by troops. Not only was it a question of providing food but enormous quantities of munitions and material were needed.

For all practical purposes the American Expeditionary Forces were based on the American Continent, three thousand miles of ocean to cross, with the growing submarine menace confronting us, the quantity of ship tonnage that would be available then unknown, and a line of communications by land 400 miles long from French ports to our probable front presented difficulties that seemed almost insurmountable as compared with those of the Allies.

* * * Our available tonnage was inadequate to meet all initial demandc, so that priority of material for combat and instruction, as well as for supplies that could not be purchased in Europe, must be established by those whose perspective included all the services and who were familiar with general plans. (P. 12.)

Digitized by Google

MILITARY SITUATION IN 1917.

At first the Allies could hardly hope for a large American Army. Marshall Joffre during his visit to America had made special request that a combat division be sent at once to Europe as visual evidence of our purpose to participate actively in the war. * * * (P. 18, Pershing's report.)

The arrival of the First Division and the parade of certain of its elements in Paris on July 4 caused great enthusiasm and for the time being French morale was stimulated. Still allied apprehension was deep-seated and material assistance was imperative. The following extract is quoted from the cabled summary of an allied conference held on July 26 with the French and Italian commanders in chief and the British and French chiefs of staff.

That is referred to in my testimony at a conference that I attended.

General conclusions reached were necessity for adoption of purely defensive attitude on all secondary fronts and withdrawing surplus troops for duty on western front. By thus strengthening western front believed Allies could hold until American forces arrive in numbers sufficient to gain ascendancy.

The conference urged the immediate study of the tonnage situation with a view to accelerating the arrival of American troops. With the approach of winter depression among the Allies over the Russian collapse and the Italian crisis was intensified by the conviction that the Germans would undertake a decisive offensive in the spring. * * * In view of this, it was represented to the War Department in December as of the utmost importance that the allied preparations be expedited.

On December 31, 1917, there were 176,665 American troops in France and but one division had appeared at the front.

That is, at the end of December, 1917, but one division had ap peared at the front. [Continuing reading:]

Disappointment at the delay of the American effort soon began to develop. French and British authorities suggested the more rapid entry of our troops into line * * *.

That was the reason that they did put them into the line later. [Continuing reading:]

EXPEDITING SHIPMENT OF TROOPS (p. 23).

The War Department planned as early as July, 1917, to send to France by July 15, 1918, 21 divisions of the then strength of 20,000 men each, together with auxiliary and replacement troops and those needed for the line of communications, amounting to over 200,000, making a total of some 650,000. * * * While these numbers fell short of my recommendation of July 6, 1917, which contemplated at least 1,000,000 men by May, 1918, it should be borne in mind that the main factor in the problem was the amount of shipping to become available for military purposes, in which must be included tonnage required to supply the Allies with steel, coal, and food.

On December 2, 1917, an estimate of the situation was cabled to the War Department with the following recommendation—

That is, the following recommendation from Gen. Pershing.

In view of these conditions it is of the utmost importance that we move swiftly. The minimum number of troops we should plan to have in France by the end of June is four Army corps of 24 divisions in addition to troops for service of the rear—Gens. Robertson, Foch, and Bliss agree with me that this is the minimum which should be aimed at. This figure is given as the lowest we should think of and is placed no higher because the limit of available transportation would not seem to warrant it.

4. A study of transportation facilities shows sufficient American tonnage to bring over this number of troops, but to do so there must be a reduction in the tonnage allotted to other than Army needs. It is estimated that the shipping needed will have to be rapidly increased up to 2,000,000 tons by May in addition to the amount already allotted. The use of shipping for commercial purposes must be curtailed as much as possible. The Allies are very weak and we must come to their relief this

Digitized by Google

year, 1918. The year after may be too late. It is very doubtful if they can hold on until 1919, unless we give them a lot of support this year. It is therefore strongly recommended that a complete readjustment of transportation be made and that the needs of the War Department as set forth above be regarded as immediate.

And again, on December 20, 1917:

It is now the middle of December, and the First Corps is still incomplete by over two entire divisions and many corps troops. It cannot be too emphatically declared that we should be prepared to take the field with at least four corps by June 30 (1918). In view of past performances with tonnage heretofore available such a project is impossible of fulfillment, but only by most strenuous attempts to attain such a result will we be in a position to take a proper part in operations in 1918. In view of the fact that as the number of our troops here increases a correspondingly greater amount of tonnage must be provided for their supply, and also in view of the slow rate of shipment with the tonnage now available, it is of the most urgent importance that more tonnage should be obtained at once, as already recommended in my cables and by Gen. Bliss.

TONNAGE REQUIREMENTS OF ARMY (P. 67, PERSHING'S REPORT).

Following a study of tonnage requirements, an officer was sent to Washington in December, 1917, with a general statement of the shipping situation in France, as understood by the allied maritime transport council. In March, 1918, tonnage requirements for transport and maintenance of 900,000 men in France by June 30 were adopted as a basis upon which to calculate supply requisitions and the allocation of tonnage.

In April, the allied maritime transport council showed that requirements for 1918 greatly exceeded the available tonnage. Further revisions of the schedule were required by the Abbeville agreement in May, under which American Infantry and machine gunners were to be transported in British shipping, and by the Versailles agreement in June.

In July a serious crisis developed as the allotment for August made the American Expeditionary Forces by the shipping control committee was only 575,000 dead weight tons, afterwards increased to 700,000 tons, whereas 803,000 tons (not including animals) were actually needed. It was strongly urged by me that more shipping be diverted from trades and that a larger percentage of new shipping be placed in transport service.

I have read that in there to show that Gen. Pershing was, of course, thoroughly conversant with the very serious situation as regards tonnage and with the very serious situation as regards the western front and the necessity of giving the Allies early support.

The CHAIRMAN. Senator Pittman, will you have some further questions to ask Admiral Sims?

Senator PITTMAN. Yes.

The CHAIRMAN. The hour of 12 has arrived. Will you have questions, Senator Trammell?

Senator TRAMMELL. Yes; later on.

The CHAIRMAN. We will adjourn at this point, then, until to-morrow morning.

(Thereupon, at 12 o'clock m, the subcommittee adjourned until to-morrow, Tuesday, Mar. 23, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

TUESDAY, MARCH 23, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in Room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Keyes, Pittman, and Trammell.

The CHAIRMAN. The committee will come to order. Senator Pittman, you had some further questions, I believe.

TESTIMONY OF ADMIRAL WILLIAM S. SIMS—Resumed.

Senator PITTMAN. I have here what purports to be a letter addressed by you, Admiral, to Senator Carter Glass, under date of February 15, 1920. [Reading:]

MY DEAR SENATOR GLASS Referring to the testimony given by Representative Byrnes and yourself before the subcommittee of the Senate investigating awards, I inclose you herewith a copy of the letter I have just written to Senator Hale, with a copy of a letter to Mr. Martin Egan, concerning my alleged criticisms of the Army, and also copies of certain letters from Gen. Pershing showing my cooperation with the Army and my relations with the Army and with the general.

These will, I believe, show you how very unlikely it is that I could have held any such opinions concerning the general's handling of the Army as was indicated by the testimony above mentioned.

Very sincerely, yours.,

WM. S. SIMS,
Rear Admiral, United States Navy

Senator CARTER GLASS,
Senate Office Building, Washington, D. C.

Admiral SIMS. Will you read the inclosures?

Senator PITTMAN. I have not the inclosures. You placed them in the record of the hearing, did you not?

Admiral SIMS. I would like to have them read.

Senator PITTMAN. I would like to read them myself.

Admiral SIMS. They are in the hearing, there.

The CHAIRMAN. Do you want to have them read or just have them placed in the hearing?

Admiral SIMS. I think they ought to be read in connection with this.

The CHAIRMAN. Very well.

Senator PITTMAN. I have them, I believe. They are found at page 636 of the hearings of the subcommittee on Naval Affairs, United

Digitized by Google

States Senate, second session, on Senate resolution 285, and they are as follows [Reading]:

NAVAL WAR COLLEGE,
Newport, R. I., February 14, 1920.

MY DEAR SENATOR HALE: When I appeared before your committee on awards on February 10, when an effort was made to convey the impression that my relations with the Army were strained, and that I was criticising the actions of the Army, I told you that my recollection was that I could produce evidence to show how very cordial the relations in question were.

I find that on November 6, 1918, I wrote a letter to Mr. Martin Egan, who was then in Paris, in which I referred to a story I had heard to the effect that I was not in complete sympathy with Gen. Pershing. I inclose you herewith a copy of this letter.

Subsequently, Mr. George Bar Baker, who is mentioned as Commander Baker in the first paragraph of the above letter, communicated to me the following extract from a letter he had received from Martin Egan:

"I never did believe the several reports from the Admiral, brought over the channel by a lot of busybodies, and neither did the general. But it was fine to have his assurances, and when I talked to the general he said he never did believe any of the tales, and that he knew all the time that the admiral was playing the game loyally with every American effort in Europe. We have the satisfaction of clearing up the matter anyhow."

As further showing the cordial relations which have always existed between Gen. Pershing and myself, and all of his forces, I inclose copies of letters received from him dated April 1, 1919, April 21, 1919, and May 4, 1919. These letters will show that nothing could possibly have been more cordial than were our personal relations and cooperation throughout the war.

Very sincerely, yours,

WILLIAM S. SIMS.

Senator FREDERICK HALE,
Senate Office Building, Washington, D. C.

AMERICAN EXPEDITIONARY FORCES,
OFFICE OF THE COMMANDER IN CHIEF,
France, April 1, 1919.

Personal.
Admiral WILLIAM S. SIMS,
United States Navy, 30 Grosvenor Gardens, London, S. W.

MY DEAR ADMIRAL: I received with a mixture of pleasure and regret your letter of March 21—pleasure at the kind words and cordial sentiments that you expressed, and regret that you were leaving England before I had an opportunity of seeing you and thanking you in person for the consistent and cordial cooperation that you have from the beginning given to the American Expeditionary Forces. That there had been such good cooperation and such lack of friction between the land and the sea forces is, I am well aware, due in the largest measure to your helpful attitude and big way of looking at things.

With heartiest congratulations for the splendid services that you have rendered to the Government during this war, and with kindest personal wishes for your health and continued success, I remain,

Sincerely, yours,

JOHN J. PERSHING.

AMERICAN EXPEDITIONARY FORCES,
OFFICE OF THE COMMANDER IN CHIEF,
France, April 21, 1919.

Personal.
Admiral WILLIAM S. SIMS,
Care Navy Department, Washington, D. C.

MY DEAR ADMIRAL SIMS: I have just received a printed copy of the proceedings at the luncheon tendered you by the American Luncheon Club on the occasion of your leaving London. I have read your remarks with a great deal of interest, and especially appreciate the very generous and kind things you said of the American Expeditionary Forces and of me personally.

Digitized by Google

I wish to take the opportunity of again expressing to you my personal appreciation, which I know voices the feelings of the whole American Expeditionary Forces, of the backing and cordial cooperation of the American naval forces under your command throughout the war. We realize fully that, had it not been for the Navy, who kept watch and guard night and day over our transport fleet, the American effort in France could never have been successful. Had it not been for you but few troops would have been landed, and those few could not have been supplied. The Navy's assistance was whole-hearted and arduous, and was always given in a most generous spirit of cooperation.

With best personal wishes for your continued good health and success, I am,

Very sincerely, yours,

JOHN J. PERSHING.

AMERICAN EXPEDITIONARY FORCES,
OFFICE OF THE COMMANDER IN CHIEF,
France, May 4, 1919.

Personal.

Admiral WILLIAM S. SIMS,
Care Navy Department, Washington, D. C.

MY DEAR ADMIRAL: I have just received a clipping from the New York Times quoting your speech on the Victory loan, in which you spoke very effectively and positively, and said some things with reference to me and the job that I had.

My dear Sims, I can not tell you just how much what you say touches me, coming as it does on top of two years of most loyal cooperation and support. I have often tried to express myself about what you did, but feel that I have never conveyed my real appreciation. Now, your speech arouses in me such a flood of sentiment that I must again leave you to divine what I feel.

Trusting that you are enjoying a long-earned rest after your more than two years of arduous service, believe me,

Yours, devotedly,

JOHN J. PERSHING.

UNITED STATES NAVAL FORCES OPERATING IN EUROPEAN WATERS,
U. S. S. "MELVILLE," FLAGSHIP,
London, S. W. 1, November 6, 1918.

MY DEAR MR. EGAN: I have just had a chat with Commander Baker, and to my great surprise he tells me that you are under the impression that I am not in complete sympathy with Gen. Pershing. How such a rumor could possibly have arisen is more than I can imagine.

If you could glance over the personal correspondence that I have had with the general, and the official letters I have had concerning the Navy's relations with the Army, I am sure your mind would be completely disabused of any such idea.

In my letters I have repeatedly stated to the general that my understanding of the Navy's position is that it is nothing to the world but the line of communications behind the Army. I believe I have explained that there is really no naval war going on; that the submarines are not fighting our military vessels, but are attacking the supply transport of munitions and food. In other words, that the German Navy is really making war against the armies of the Allies, and that our business as naval men is to do our best to insure this line of supply.

Not only have I been in complete sympathy with Gen. Pershing but I have been lost in admiration over the way in which the biggest military stunt in all history has been handled. If I have not actually said it to the general, I have repeatedly said to others that I have little conception as to how such a problem could be handled without getting things tangled up; that the stunt the Navy has to perform is, in comparison, simplicity itself; and I have always expressed my sincere sympathy with the difficulties the Army has to encounter.

Of course, you know, as well as I do, that a war can not be conducted by a number of allies without there being a certain amount of criticism in each country of all the other allies. We have, of course, not escaped such criticism. You will hear at times in general society, both in London and in Paris, expressions of regret that things are not going as well as could be expected with the American Army, or the British Army, or the Italian Army, as the case may be. Unfortunately, when such opinions are occasionally refused, some people will try to bolster up their case by quoting the supposed remarks of people who are more or less in the public eye. It is possible that I may have been quoted in this way, but I can assure you that it is wholly unjustifiable.

Digitized by Google

Of course, I do not know what rumors and gossip you may have heard, but I should consider it a favor if you would write to me very frankly as one American to another and tell me what you know, so as to give me an opportunity to state my case.

Very sincerely, yours,

WILLIAM S. SIMS.

M. EGAN, Esq., *Paris.*

Those were the letters, I assume, Admiral, that were inclosed with your letter to Senator Glass under date of February 15, which I have just read.

Admiral SIMS. Inclosed to Senator Hale. I sent copies to Senator Glass.

Senator PITTMAN. Yes.

Admiral SIMS. I received a reply from Senator Carter Glass, in which he does not agree with the sentiments that I expressed.

Senator PITTMAN. This is the letter of Senator Carter Glass in reply to your letter in which you inclosed copies of the letters I have just read. [Reading:]

FEBRUARY 17, 1920.

MY DEAR ADMIRAL SIMS: I have yours of February 15, inclosing your letter of February 14 to Senator Hale with certain letters attached, written by you on November 6, 1918, to Mr. Martin Egan, at Paris, and written to you at London on April 1 and 21, and at Washington on May 4, by Gen. Pershing. I note your suggestion that these letters should convince me of the unlikelihood of your having "held such opinions concerning Gen. Pershing's handling of the army" as was indicated by my testimony before the subcommittee of the Senate Naval Affairs Committee on February 10.

I disagree no less with your method of stating the case than with your deductions. In the first place, I gave no testimony touching your "opinions concerning Gen. Pershing's handling of the army." Inspection of the record will clearly disclose to you that I testified as a matter of fact and not as to any opinion of Gen. Pershing held or expressed by you. Pointedly, I testified that, on October 30, 1918, in your apartment at the Hotel Crillon, in Paris, in response to my statement that Gen. Pershing ten days theretofore, had signified his opposition to an armistice with Germany, you explicitly said to Congressmen Whaley and Byrnes and me that we were obliged to grant an armistice because the communications of supply of the American army had broken down. Of that fact I have no more doubt than that I am writing to you at this moment, nor has either of my former colleagues any doubt of it. I might have added that, with a gesture, you precluded further talk on the subject by saying: "Oh, well, it will all come out in due course."

The fact that nearly seven months later you and Gen. Pershing exchanged cordial personal letters can not alter the circumstances nor in any way affect my distince recollection of it. The further fact, as disclosed by your letter of November 6, 1918, that a week after our audience with you in Paris, and after your return to London, you found it necessary to write Mr. Egan to set him straight concerning your attitudt toward Gen. Pershing and the American army, so far from altering my retrospect, singularly accentuates the likelihood that, prior to the discovery of your mistake, you had said to other persons substantially what you said to Congressmen Byrnes and Whaley and me on October 30, 1918, and which caused my two colleagues to travel 150 miles to Tours in an open automobile, in desperately chilly weather, for purposes of verification.

But, these things aside, I must decline to concede that anything could be adduced that would create one particle of doubt in my mind as to the absolute accuracy of my statement to the subcommittee of the Senate Naval Affairs Committee as to what you said in Paris to my colleagues and me.

In this connection I shall take leave here to say something which I could not have said on the 10th instant without appearing to break in rudely on your testimony before the committee. In this testimony you were at pains to include me in the suggestion that, if we believed you had made at Paris the statement ascribed to you and subsequently had found out that it was not true, we had neglected our duty in not "putting up a howl" to get you dismissed from the Navy. As it seems to me, in your eagerness to make this superficial point, you failed utterly to realize the nature of the only presumption upon which it rationally could be based. In short, to sustain this contention, you must assume that I was wrong in my inference that your statement to me at the Crillon in Paris was the recital, in good faith, of something which

Digitized by Google

you had been told as a fact and which you had repeated to my colleagues and me, believing in its truth. Apparently you think I should have regarded your statement, when it was ascertained to be untrue, as a malignant invention of your own, uttered by you with deliberate intent to defame the American Army: and your grievance against me is that, without troubling to consider how you came by the misinformation and without for an instant attributing to you an evil motive, I regarded your character as a man and your honorable record as a naval officer a sufficient defense against the suspicion of a mean action. I distinctly testified, not once but twice, that I had not gotten the impression from our conversation that you intended to be critical of the American Army or in any way to disparage its officers; but from your testimony I conclude that you resent this equable state of mind on my part, since you insist that I should have regarded you as a slanderer and "put up a howl" for your dismissal. I am puzzled to divine how you may derive any satisfaction from such an attitude.

Sincerely, yours, CARTER GLASS.

Rear Admiral WILLIAM S. SIMS,
Naval War College, Newport, R. I.

On the 9th day of November, 1919, Admiral, you wrote a letter to Admiral Lewis Bayly, of the British Royal Navy. This was two days before the armistice. I quote from that letter. [Reading:]

It has been the opinion that it would be impossible to force the enemy back through the Argonne Forest, not only on account of the great difficulty of the terrain but also because the troops operating in this area could be supplied only over one main-line road. It was hardly thought possible that this road could carry supplies sufficient for the number of troops necessary. There is no doubt that the military opinion was sound, assuming that the attacking forces were not willing to make greater sacrifices than troops are usually called upon to bear. That these sacrifices were necessary is but too apparent. Of course, I do not know much about details at present, but enough to know that they were very severe. It turned out, as was to be expected, that the road was not sufficient to supply all the needs of the troops. Horses had to be slaughtered to supply the troops, notwithstanding the scarcity of horses at this time. However, there is nothing succeeds like success, and the cutting of the important railway lines has been accomplished.

That is all that I have on this line on this topic, Mr. Chairman.

Senator TRAMMELL. Admiral, just what time in 1917 was it that you went to Europe under orders of the Navy Department?

Admiral SIMS. As I remember it, I left on the 31st of March, 1917.

Senator TRAMMELL. The conversation that took place between you and Admiral Benson, then, when he warned you against Great Britain, was prior to that date?

Admiral SIMS. Just a few days before.

Senator TRAMMELL. Just a few days before?

Admiral SIMS. Just a few days before.

Senatore TRAMMELL. In other words, it was before the declaration of war.

Admiral SIMS. Yes, before the declaration of war, which was April 6.

Senator TRAMMELL. And after the declaration of war I believe you stated that he did not state to you that he would as soon fight Great Britain as to fight Germany?

Admiral SIMS. No, on the occasion of his visit to England in October, or something like that, all he said on that occasion was to express the opinion that I should not let the British pull the wool over my eyes, or an expression similar to that. In my testimony yesterday what I intended to convey was that it was the expression that he made use of on that occasion that I did not remember. I saw in one of the papers this morning the statement that I had said I did not remember any of those expressions having been used until somebody

Digitized by Google

reminded me of it. Of course I remembered the one that was told me in Washington. I probably never will live long enough to forget it. It was graven on my memory, I can assure you; but I did not remember what he had said to me in London until my attention was called to it by one of my staff who was present and heard it. That is what I meant yesterday. Of course he did not say then that he would as soon fight Great Britain as Germany.

Senator TRAMMELL. I just want to get those dates fixed.

Admiral SIMS. Yes.

Senator TRAMMELL. That is, I wanted to get those dates into the record. I do not think they were put in the record yesterday. Now, in your direct testimony you made this statement on the question of the losses of tonnage and so on:

It can thus be said that the failure of the Navy Department to enter the war immediately and whole-heartedly cost the allied cause as a whole two and one-half million tons of shipping sunk unnecessarily. While this is, of course, an estimate only, it is based upon actual results obtained when our help became effective, and there is no reason to doubt that it is a conservative estimate.

Here is a drawing that was transmitted with this letter of transmittal to the Navy Department from your headquarters.

Admiral SIMS. Shall I read this letter?

Senator TRAMMELL. No, you need not read it. I just exhibit the letter to you for the purpose of identification of the drawing here.

Admiral SIMS. Yes.

Senator TRAMMELL. That drawing or schedule purports to be information as to the amount of available tonnage to the Allies, and also the amount of submarines available to the Germans, as I understand the letter of transmittal and the explanatory notes. That shows the tonnage available to the Allies to June 1 or June 30, I am not sure which, 1918.

Admiral SIMS. Now perhaps it will clear up that situation—and I am just as anxious to clear it up as you are—if I may give you now the data on which the statement in my direct testimony was based. I made out a full statement of it, but decided not to include it, on account of the number of pages and that sort of thing, and I summarized it in the statement that is there. The difference is that one includes American tonnage and the other does not.

Senator TRAMMELL. This one here does not include American tonnage?

Admiral SIMS. Yes, this one does include American tonnage.

Senator TRAMMELL. This includes American tonnage?

Admiral SIMS. Yes.

Senator TRAMMELL. Does this chart show that there was more or less tonnage available during the spring of 1918 than during the spring and summer of 1917? Does it show more or less?

Admiral SIMS. Less. It shows less. It is coming downhill. Generally speaking, without looking up the actual details, the tonnage successively decreased with great rapidity in the spring of 1917, with less rapidity in the summer, and with still less rapidity in the fall, and it was only much later that the two curves crossed each other. We kept that in my headquarters, a chart going, which showed the decrease in losses and the increase in building, and we worked out a curve to show when they crossed. You can see by glancing at the curve there where they cross. It was for that reason that when we

Digitized by Google

saw these two curves approaching, we could make an estimate perhaps two or three months ahead as to when they would cross, and I remember stating, I think it was to a party of American correspondents in London who came over there officially, that we estimated that the two curves would cross each other in a certain month, I can not remember whether it was June or July or something else, in 1918. I remember that attracted a great deal of attention in the press, as to when they would cross, and the crossing was about that time.

That crossing meant that the building on both sides, in America and in Europe, was a little bit greater than the losses by submarines at that time, and from that time on we were on the increase in tonnage. But it was well along in 1918, about the middle of March, 1918, when the building of merchant ships in America and in England combined crossed the curve and became a little greater than the sinkings at that time. The curve of the sinkings was going down and the curve of the building of ships was going up, so from that time on we knew, and the Germans knew that they could not succeed with their submarine campaign. But the great period of danger was in the late summer and fall of 1917. As Mr. Hoover testified, that danger was excessive in April, May, June, and the summer of 1917, and continued to be very grave until the winter of 1917-18. That is generally the situation of the tonnage.

Senator TRAMMELL. According to the chart that was transmitted to the Navy Department from your headquarters there was more tonnage available in 1917 than there was available up to June, 1918, was there not?

Admiral SIMS. Yes, there was more tonnage available in 1917 than there was in 1918, because it was successively decreased during that period. That was what was the matter with the whole business. It was decreasing so rapidly, and that decrease had to be stopped, or they could not have won the war.

Senator TRAMMELL. In the spring of 1918, with less tonnage than was available in 1917, was not the movement of American troops over very largely increased?

Admiral SIMS. The movement of American troops was not largely increased until the crisis came in March; March 21 the great drive on the western front. Immediately after that the big movement came. Up to that time, in the first year of the war, we had from 250,000 to 300,000 troops taken over. The average per month was about 25,000. From that time on they saw the necessity of getting the troops over, and they were enabled then to withdraw from a great many steamer lines shipping which they would not have dared to withdraw if it had not been that our own shipping and the allied shipping was on the increase and was greater than the destruction. That is the point Mr. Hoover brought out also, and it is a very important point. If we could have seen ahead a year, and could have been sure that we were going to arrive at a position where the increase in the building of tonnage surpassed the destruction, we could have taken the action in 1917 which we did take in March or April, 1918, and succeeding months, but which we would not have dared to take and which it would not have been prudent to take in 1917. I do not know whether that is very clear or not.

Digitized by Google

Senator TRAMMELL. I think I understand your point, Admiral. Of course, if we could have seen that we were going to have an increased supply of ships and a decrease of the submarine menace, we might have carried more troops in 1917.

Admiral SIMS. We would have dared to do it, but we did not dare to do it until we were sure of that.

Senator TRAMMELL. Really, that is just about what I thought. If that is true, was not that one of the elements that caused the delay in the progress that was made in the war, instead of it being all dependent upon the question of the Navy not entering the war whole-heartedly as you charge?

Admiral SIMS. The tonnage situation, of course, is what influenced it, but the trouble is that by our tardiness in entering the war we lost two and one-half million tons of shipping which we should not have lost. If we had butted in with all of our force in the very beginning, instead of coming in whole-heartedly after six months or a year, we would have saved that tonnage and that situation would not have arisen. I do not know whether you know it or not, but up to the first year of the war we did not have much more than 100 ships of all classes on the other side, and there was not a single ship that was not available or could have been available to be over there in the first 15 days of the war. Now, there is the whole point of all of my statement and all of my criticism. I have not got anything to say about anything else particularly, except that the Navy Department and the Government did not go into the war after they had declared it.

Now, I made a little statement at the end of this long statement, about the shipping, which I did not include in the other, and I think probably the best way to clear that up, with your permission, is to read that statement. I think it will clear it. This is a review of the merchant ship tonnage situation. I did not include it in the other statement on account of its length. I warn you that this is a little tedious and had figures in it and will require close attention.

A few facts and figures about the merchant tonnage situation, in 1917, may help to an understanding of why the losses in the submarine campaign were so dangerous.

In August, 1914, the total tonnage of the world was, approximately, 45,000,000 gross tons; of this about 5,000,000 tons was interned in the ports of the Central Powers, leaving about 40,000,000 tons, as Mr. Hoover stated before the committee. This 40,000,000 tons, however, included large numbers of ships used by the neutrals, Japan and the United States, for their own purposes. The best available figures of the allied shipping authorities show that in August, 1914, 31,500,000 tons of shipping was all that was available for the allied powers. This does not include the American shipping, which was comparatively small.

The total imports of Europe (other than Russia and the Central Powers) were about 170,000,000 tons annually. It required the employment of about 25,000,000 tons of merchant shipping to transport these imports overseas to their European destination.

In the first 28 months of the war, or to January 1, 1917, the total net loss of this tonnage amounted to 400,000 tons. The allies still had, therefore, 31,000,000 at their disposition, American seagoing tonnage of 2,500,000 not being included.

Digitized by Google

About 8,500,000 tons of this shipping was being used by the allies for exclusively military or naval purposes, other than trans-Atlantic transport of munitions and supplies. Another million tons wa almost constantly under repair. The net amount available for imports of food, munitions, raw materials, etc., was, therefore, only 21,500,000 gross tons. War restrictions had reduced imports enough so that this quantity was sufficient, and a margin of safety was in existence as large as that at the outbreak of war. This fact was known in shipping circles, and was constantly emphasized by the allied governments to discount, in the minds of their people, the losses suffered through the submarine campaign.

The situation changed sharply for the worse, however, with the beginning of 1917. In the first quarter the net losses rose to 1,300,000 tons. In the month of April alone the net loss mounted to 800,000 tons, or twice as much as in the whole period of the war, up to January 1, 1917. In four months the margin between the amount of tonnage available and the absolute minimum required had been cut in half, and had sunk from about 6,000,000 tons to about 3,500,000 tons, allowance being made for the increased amount under repairs, as a result of damage received in unsuccessful attacks by submarines.

With a rate of loss amounting to about 800,000 tons net per month, or nearly 10,000,000 tons per year, this margin would have been completely wiped out within five months, or by October 1, 1917. Imports to Europe had already been reduced to 100,000,000 tons annually, or a reduction of 40 per cent. That is by the decrease of consumption, luxuries, and that sort of thing. They could hardly be reduced much further without starving the armies or the civil populations of the allied countries. By starving the neutrals and requisitioning their shipping, enough tonnage might have been obtained to keep things going until the end of the year. It is, however, practically a certainty that, if the rate of losses experienced in April had been continued, the Allies would have been compelled to sue for peace by the end of 1917. They would have lost the war. Any help the United States might have been ready to render later would have been absolutely unavailing.

Fortunately, the adoption of the convoy system, and also of the antisubmarine measures recommended to the department from April, 1917, on, resulted in a reduction of the losses to half the April rate for the last half of 1917, and to one-third the April, 1917, rate for the ten months of 1918.

Even so, the losses still were very heavy, and caused great privation to the allied countries. It has not been sufficiently realized what herioc efforts were made in order to overcome the shipping shortage. Imports of the allied countries were cut in half, and the populations put on comparatively meager rations.

This measure alone would have failed to meet the issue. The imports required would still have been greater than the tonnage available permitted, if this tonnage had been kept on its normal routes. Through the war efforts of America, however, the United States became almost the sole supply source of the Allies. Shipping was diverted from the longer South American, Pacific, and Oriental trade routes, and concentrated on the trans-Atlantic route. The additional number of trips each ship could make per year was thus

Digitized by Google

just so much tonnage added to the allied mercantile shipping resources. Mr. Hoover's appeal to the American people to save food for the Allies was promptly responded to, and America was able to provide enough food to meet the Allies' needs, and the longer shipping hauls were thus eliminated.

Australian wheat, South American wheat, and so forth, banked up three and four million tons. It takes shipping a very long time to bring it. The food could be supplied from America by the shorter haul.

Despite all these efforts, the crisis was very grave in the early months of 1918. Hence the importance of the time element which was so repeatedly insisted upon to the Navy Department. The average monthly losses for the six months of the unrestricted submarine warfare, before American naval aid became effective (February to July, inclusive), were 640,000 tons per month. The average losses for the first six months of partial American intervention and of the use of convoys (August 1, 1917–February 1, 1918), were 390,000 tons per month. The average losses for the remaining period of the war, when American help was really effective (February 1, 1918–November 11, 1918), were 250,000 tons per month.

It is therefore possible to estimate what American help would have accomplished had it been rendered promptly instead of being delayed for some months. There is the point of all the criticism I have made—practically the basis of it. If the process of our getting into the fight, once we were at war, had been accelerated, as could have been done, by sending over immediately, in April, 1917, all available antisubmarine craft, and by accelerating and adopting the convoy system, there is no reason to doubt that, during May, June, and July, the losses would probably have averaged 250,000 tons per month less than they did, that is, the difference between the averages for the first two periods just referred to. For the six months following the losses would probably have been 140,000 tons per month less than they actually were. For the remaining nine months of the war losses would probably have been reduced another 100,000 tons per month. While this is only an estimate, it is based on actual results obtained when our help became effective. The delay of the Navy Department in getting into the war in the critical zone, backing up the Allies whole-heartedly, and accelerating the production of antisubmarine craft, probably resulted in the unnecessary loss to the allied cause, as a whole, of 2,500,000 tons of merchant shipping. The loss of this shipping in 1917 and the early months of 1918 delayed proportionately the transport of the American army to France. If a million additional tons of shipping had been available at the end of 1917, the rate of transport of American troops and supplies could have been doubled; the Allies could have been in a position to counter attack three months earlier, and the war might well have been ended by the time when, as a matter of fact, the allied success only began, i. e., in July, 1918. If this had been possible, four months of bloody fighting would have been avoided and probably half a million lives saved, to say nothing of some billions of dollars.

The shipping shortage was therefore acute from the middle of 1917 on to the time of the armistice. All plans for American assistance to the Allies was conditioned upon and limited by the tonnage consideration, as Mr. Hoover has testified. From the standpoint of the

Digitized by Google

Allies, there was a choice between receiving supplies to maintain their own armies, or American troops, which would require more supplies, for the importation of which tonnage was not available. As a result of this situation, America was not pressed to send troops, badly as they were needed, but the Allies decided to keep their own armies supplied with the available tonnage. Only the German offensive of 1918 forced the Allies to appeal for American reinforcements on a big scale. In order to transport these to Europe the British had to abandon practically the whole of their shipping routes except that with America, and to turn over practically the whole of their liner tonnage for the transport of American troops. New pressure was brought to bear on the neutrals, and they were practically forced to turn over to the Allies an additional half million tons of shipping. Only then was the transport and supply of the American army in 1918 made possible.

In view of these facts, it is not a difficult matter to estimate with accuracy the loss suffered by the allied cause as a whole, by the failure of the Navy Department to cooperate whole-heartedly, and to send to the war zone all available antisubmarine craft in the first months of the war. As has been already noted, there were three stages to the unrestricted submarine campaign, distinguished by the measure of American cooperation.

The first was the period, February, 1917, to August 1, 1917, when American aid was ineffective, and when the bulk of the shipping was not convoyed. Losses were on the average 640,000 tons per month.

The second was the phase of moderate assistance from America, and a partial employment of the convoy system, the period from August 1, 1917 to February 1, 1918. Losses were 390,000 tons per month on the average.

The third period was from February 1, 1918, to the armistice, with losses averaging 250,000 tons per month; this was the period when full cooperation was given by America, and when full use was made of the convoy system.

If the process of our getting into the fight, once we had gone to war had been accelerated, as it could have been by the immediate sending to Europe of all available antisubmarine craft, and by the immediate adoption of the convoy system, as was urged upon the department, the first period referred to above would have been ended in April. Losses during May, June, and July would have been those of the second period, or 250,000 tons a month less than was actually lost. Similarly, the second period would probably have ended by August 1, and losses for the next six months would have averaged 140,000 tons a month less than the actual figures. The submarine campaign would have been so far defeated by February 1, 1918, that the losses during the remaining period of the war would probably have been reduced by another 100,000 from those actually suffered. It can thus be said that the failure of the Navy Department to enter the war immediately and whole-heartedly cost the allied cause as a whole 2,500,000 tons of shipping, sunk unnecessarily. While this is, of course, only an estimate, it is based on actual experience, and on what actually happened in the various phases of American naval cooperation in the war.

Digitized by Google

The result of the loss of this shipping can also be translated into a prolongation of the war, and an unnecessary sacrifice of blood and treasure in accomplishing the victory.

If, in the fall of 1917, the Allies had had at their disposition the additional million tons of shipping, which, as has been pointed out above, was unnecessarily lost to the allied cause, by the delay on the part of the Navy Department in getting into the war, and in adopting the convoy system, it would have been possible to double or triple the number of American troops that were being sent abroad before April, 1918, without affecting the transport to the Allies of essential military supplies or foodstuffs. America could have had a million men in France by March 1, 1918, instead of 250,000.

The earlier defeat of the submarine campaign would have reacted on the morale of the German army and the German population in 1917, as it actually did in 1918.

Now, there is the point I would like to make with all possible emphasis. If we could have put a million men in France in 1917, as we actually did in 1918, we would have broken down the morale of the German population and the German army that much sooner. All the information that we have at the present time shows us that their army went to pieces because of the decrease of its morale and because of the decrease of the morale of the population behind it.

The German high command would have been forced into its desperate military venture earlier than was actually the case, or would have been forced to endure, in the early spring, the victorious assault of the Allies. In either case, the presence of a million Americans on March 1, 1918, and of another million within the three months following, would have forced the victory by July, if one may judge by what actually happened when this American force did become available. We know what did happen.

The unnecessary loss of shipping can therefore be stated as having caused a prolongation of the war a minimum of about four months, and thereby was responsible for the unnecessary killing of a half million men, and of the expenditure of many billions of dollars.

Now I would like to put that in the form of a perfectly simple illustration which can be understood by anybody. It all hinges upon this question, Was our naval effort in the war effective? We all know that it was. Those who oppose this argument have got to assume that it was not. If it was effective, it must have shortened the war. It therefore follows that if there was delay in making it effective, this delay prolonged the war. If three engines will put out a fire in a certain time, four engines will put it out in less time. If there is delay in sending the fourth engine, there will be a corresponding loss. I have shown by the official records that there was delay; delay in preparing for war, even after February 2, 1917, and delay in sending forces and personnel after we declared war. Therefore those responsible for this delay are responsible for the appalling sacrifices of life and treasure that resulted. That, I think, makes the situation entirely clear.

Senator TRAMMELL. According to a chart that you introduced in evidence here, if I understand it correctly, about the 1st of July, 1917, there was a very rapid decline in the submarine menace, beginning from the 1st of July. This is a chart that you introduced in testimony.

Digitized by Google

Admiral SIMS. Yes.

Senator TRAMMELL. What do you attribute that very rapid decrease in the accomplishments of the submarine to, beginning with the 1st of July, 1917?

Admiral SIMS. It was largely due to the introduction of the convoy system. By that time a good proportion of the American shipping was in convoys; and it was due also to the augmentation of other means of defense. They were using then the depth charge to a much greater extent than they had before. They were also using other means; mines, etc.

On the 11th of September I wrote a letter to the Navy Department of which I will quote a paragraph here. [Reading:]

With reference to the antisubmarine campaign, generally speaking, the losses since April have not increased but, on the contrary, appear to be on the decrease. This, coupled with the fact that the number of submarines operating has, if anything, increased, is difficult to explain. There is considerable difference of opinion as to the causes for the above. The most reasonable opinion as to decrease in submarine losses and upon which there is the greatest degree of unanimity is as follows:

(*a*) The gradual extension of the convoys system together with increased experience of both the merchant shipping and escorting craft.

(*b*) Increase of antisubmarine craft and constant increase of experience thereof, coupled with the more extensive use of the depth charge.

(*c*) Effect on enemy submarine morale from the above, and particularly, from the more extensive use of depth charges. It is wholly impossible to estimate the number of actual submarine losses caused by depth charges, but the fact that depth charges are used liberally whenever a submarine is encountered, unquestionably has a marked effect upon morale.

(*d*) Difficulty the enemy must be experiencing in maintaining an adequate supply or efficient torpedoes.

Senator TRAMMELL. Was our navy rendering any effective assistance beginning with the 1st of July, 1917, when there seemed to have been a turn in the tide of submarine destruction?

Admiral SIMS. We may say that if we had sent over only one destroyer it would have been rendering effective assistance in proportion to the number of destroyers employed as a whole by the Allies. On July 1, 1917, we had 20 destroyers and 2 tenders actually engaged on the front. They were extermely useful, as useful as 22 other vessels of like character of the Allies. Our destroyers did as good service as anybody else's. They helped out. The convoy system, putting it in operation, was the turning point of the whole business. I do not know that it would be well to go into any discussing of that thing now, because it is rather a technical question. When you come to consider the fact that in the situation which confronted us in 1917 and 1918, the whole of the war hinges upon the preservation of sufficient tonnage to carry on the war, or rather to bring the war to a termination as soon as possible, there is a time before which it would not have been advantageous to put in operation a convoy system. Without going into any explanation of that, I can just give you an idea of what I mean. Many men who were interested in very large shipping companies, having perhaps 150 or 200 ships, were opposed to the introduction of the convoy system, and it was for this reason. One of those men said to me: "I find out by experience that one of my ships can make about 12 or 13 voyages, on an average, without getting torpedoed. If I put him into convoy, where he has to wait for convoys to be formed and where he has to conform to the speed of the slowest

Digitized by Google

ship, I can get only, say, 8 round turns instead of 12 or 13, in the same time. Freight rates are so high that I can afford to lose my ship after 12 or 13 trips, rather than to cut down the number of trips by that much."

Applying the same principle to all the tonnage of the Allies, it follows that if you want to bring a war to a successful conclusion you can do the same thing with your tonnage; that is to say, use it to bring supplies in the fastest possible time, if you think it safe to do so. There comes a period, however, when it is no longer safe to do so; and the adoption of the convoy system was the turning point of the whole thing, as has been fully explained in my testimony and in the articles that I have written.

Senator TRAMMELL. When did our associates in the war adopt the convoy system?

Admiral SIMS. They adopted the convoy system on the 21st of May. They carried out experiments during the early part of May.

I recommended the convoy system about the 1st of May, 1917. It was then in discussion and had been for a long time. They carried out an experimental convoy which, if my recollection serves me right, arrived in Great Britain about the 20th of May, and I think that the 21st of May I reported to the Navy Department that it had been adopted in principle and would be put in operation as soon as possible.

Senator TRAMMELL. These losses, then, which occurred from the submarine during April and probably part of May, if they had not put it into full operation, if they are to be charged to anybody, might be charged to our associates probably more than to America, could they not, if there was a mistake and there was a neglect in adopting the system?

Admiral SIMS. It depends on when the convoy system ought to have been put in operation. That is something on which I would not care to express an opinion. When the whole thing came up over there it was a question of animated discussion among the allied navies as to when the convoy system should be put in operation. There were those who were in favor of it and those who were not. As I have already explained, one of the principal opponents to the thing were the merchant shippers themselves and the merchant shipping companies; but it was finally decided that they should put it in operation early in May, and they had an experimental convoy that came up from Gibraltar, and on the 21st of May, as I remember—no; the 31st of May. Here is a cable that I sent to the Navy Department on the 31st of May. [Reading:]

With reference my two previous dispatches concerning convoy system of handling merchant shipping, Scandinavian and North Sea convoys in force now over a month have proved very successful. First ocean convoy from Gibraltar arrived safely on May 20. Second ocean convoy from Hampton Roads of 12 merchant ships escorted by British cruiser sailed May 24. They will be met outside and escorted through submarine danger zone. The department's cooperation with the plan set forth in my dispatch of May 1 is urgently recommended. Early reply important in order that Admiralty plans may be governed accordingly.

So that on the 1st of May I recommended that the Navy Department cooperate with the Allies on a convoy system, but I was wholly unable to get them to do so, and I was constantly urging them for some months before they would come into the convoy system. That was due to a false estimate which they made which was based upon

Digitized by Google

a false premise, that concerned the Army, the merchant ships, and efficiency of ships, etc. I can explain that further if it is necessary.

Senator TRAMMELL. Now, it is apparent that our associates in the war delayed putting the convoy system into effect. Might we not charge that had they put the convoy system into effect six months sooner, the war would have been ended six months sooner?

Admiral SIMS. You can perfectly well do that, provided that they had the material to do it. But all the testimony I have given shows, and supported by the testimony of the British Admiralty, Admiral Jellicoe in particular, in the communications on this subject, that they did not have the ships that were necessary to do it. They were progressively increasing their submarine craft, they were building sloops. Their destroyer program provided for six to eight destroyers a month, and as they got enough destroyers to do so, they put the convoy system into operation. They could not put it into operation completely without the destroyers of America. They asked us for 14 cruisers for escort. America did not accord them those cruisers until after a long delay, and it then finally gave them. Up to that time their cruisers had been used on what is called the ten s e (?), up to Iceland and off the ice banks, to head off the raiders that had been coming out, the *Moewe* and vessels of that type. They had to withdraw those and put them on convoy.

Senator TRAMMELL. When they first adopted the convoy system were they still maintaining a great many ships on those long trade routes, or was that convoy system adopted after they had diverted their shipping to the Canadian and American coast more, so as to get a shorter haul?

Admiral SIMS. I do not quite understand the first part of your question.

Senator TRAMMELL. When they first adopted the convoy system were they still sending ships to Australia, and having ships go on routes that required weeks for a voyage, instead of sending them across for cargoes where they could get them quicker, as they could from America and Canada?

Admiral SIMS. You would have to go into the history of the shipping to see just when that was done. I would not be sure about that. But there is one point you have not mentioned, and which bears on this question particularly. You must remember that the unresricted submarine campaign only began in February. If you will read Grand Admiral von Tirpitz's book, which for anyone interested in naval affairs is one of the most interesting publications I have ever read, you will find in there that the submarine campaign before February was a restricted one, and he constantly inveighed against the restrictions. They were not allowed to attack certain ships, and the submarine commanders constantly reported that that restricted them, particularly, because they could not always be sure whether a ship was a merchant or passenger ship, and they did not dare fire for fear of losing their commission, and all that sort of thing. The whole thing changed when the Germans determined that they must put in an unrestricted campaign; that is, any ship at all big enough to waste a torpedo on, they would fire at it. That brought about a new situation entirely. That new situation began from that point; because, as I have pointed out, up to the time of the introduction of the unrestricted submarine campaign the total losses of the Allies on the

Digitized by Google

whole were only 400,000 tons, or half as much as they lost in April, 1917. So that what we are talking about is the force subsequent, you see, to February, 1917.

Senator TRAMMELL. If anybody is to be blamed for the loss in April, 1917, it is not the United States, is it?

Admiral SIMS. How is that?

Senator TRAMMELL. If anyone is to be blamed for the loss in April, 1917, which was the high water mark in losses, the United States is not to be blamed for that, is it?

Admiral SIMS. The United States is not to be blamed for that, no; but the United States is to be blamed for the losses in the latter part of the month of April, and for the losses in the month of May, in proportion to the assistance they could have given.

Now, as to whether the convoy system was put in operation as soon as it ought to have been or not, that, I say, is a matter of professional opinion. You will find that thing explained in the United States Service Institute by an officer there, who discusses this whole question. It is a question of naval controversy there at that time as to whether it ought to have been put in earlier, as to the errors made by the Allies in reference to the convoys, if they were errors, and in reference to the conduct of the war in general—heavens knows, there are plenty of them, as you will find out by reading the criticisms since in books published. The severity of the criticisms there makes the criticisms that I have made here look like 30 cents. Of course they made mistakes all during the war. It was a new proposition. Nobody had any experience of this kind of warfare at all, and nobody could be savage enough in his disposition to know what the Germans would do, and therefore to prepare for it; so that I would advise you to be a little bit gentle in criticisms of the naval officers in general, because they were not prepared for this war, because we are a more or less civilized people, and we could not possibly have imagined that the Germans would do what they did do. If we could have imagined it we would have prepared for it and built destroyers galore, if we could have persuaded Congress to give us the money.

Senator TRAMMELL. I am not criticising, Admiral, at all, myself. I realize that hindsight is always a good deal better than foresight, and that is so even more than in matters of everyday affairs, in which I know it is true that hindsight is better than foresight, so that I do not criticise. I said "if anybody was to be blamed."

Admiral SIMS. Now, as to whether the Allies were to be blamed for it is not quite the question. We went over there and had the benefit, as fast as we could acquire the information, of knowing what errors or alleged errors they had made, and with that information, which the Allies did not have when they started the war, we should not have made the same errors that they did; but unfortunately we did. If Great Britain was tardy in going into the submarine campaign—and it makes no difference to our case whether she was or not—we were doubly to blame, if we believe that for being tardy ourselves and holding back for some months. That is the point about the whole business, and I tried to make the whole thing clear.

Senator TRAMMELL. The point I have in my mind is to fix the responsibility for this loss of 500,000 lives and the loss of 2,500,000 tons of shipping unnecessarily, and also the expenditure of $15,000,000,000 unnecessarily. I want to find out if the blame for all of that

Digitized by Google

is to be placed upon the United States, or probably some of these other people were at least to a minor degree responsible for it, if that is true.

Admiral SIMS. They may have been responsible for certain errors, but the point about it is this——

Senator TRAMMELL. I want to find out what the facts are, and I want to find out whether the United States has been guilty of practically homicide in 500,000 cases and the waste of this great treasure, and so on, or if the other nations should stand under that indictment; whether they are partially responsible for it.

Admiral SIMS. Let me point out this fact. Anybody who takes the ground that the delay of the United States in going into the war was not responsible for certain losses must assume that the naval intervention of the United States was not effective. And I do not assume that. I assume that the United States intervention was effective, and fully effective in proportion to the number of the forces we sent over. In order to make good the argument that our tardiness in going in did not result in loss of life and property, you must necessarily assume that the United States naval intervention was not effective. Now, I assume that it was effective, and that it did help decrease these losses, and that it thereby lessened the duration of the war. If it was not effective, or if there was delay in going in, it must have proglonged the war. Now, I take the attitude that the United States intervention was effective, and I think you must be forced to take the attitude that the United States intervention was not effective, and therefore it did not make any difference whether we got into operation or not.

Senator TRAMMELL. I did not say so.

Admiral SIMS. No, but I think that conclusion is forced.

Senator TRAMMELL. I did not take your position, at all. I do take the position, though, that if your statement is correct that the lives of 500,000 people were lost unnecessarily and all these other losses occurred, the United States has not got that indictment hanging over her head and that the facts do not sustain it.

Admiral SIMS. I believe that the facts do sustain it.

Senator TRAMMELL. You might as well say that the other people because they did not do this, that and the other 6 or 12 months previous—some stunt by which they might have won the war—have got to have that charged up to them.

Admiral SIMS. Every one of them has got to have something charged up to them; but that does not alter the fact that we have this charged up to us. If our intervention in the war did decrease the length of the war, and if it was useful it did decrease the length of the war and if it was not useful it did not, now I claim that it was exceedingly effective, and in order to sustain your argument you have got to take the position that it was not effective.

Senator TRAMMELL. No, I claim that it was effective. I see by your own chart that beginning in July the submarine campaign was very much diminished in its effectiveness, and the line began to go down a very little.

Admiral SIMS. It did drop, and if we had put in that same effort at the beginning it would have begun to go down that much sooner.

Senator TRAMMELL. Oh, yes; if we had declared war a year before we did, of course the war would have been over that much sooner.

Digitized by Google

Admiral SIMS. Not a year before.

Senator TRAMMELL. Or six months. That involves the policy of the country going into the war.

Admiral SIMS. The country had already gone into the war on the 6th of April. If those vessels had sailed that night, and there is no God's reason why they should not have been ready to sail, and gotten into the thing by the end of April, the decrease in the losses you speak of in July would have begun then, and we would have saved 2,500,000 and we would have been able to put an army into France by May 1, 1918, of a million men.

Senator TRAMMELL. Admiral, if our associates had put into operation the convoy system sooner, would it not have had the same effect?

Admiral SIMS. Yes; but we were the ones that delayed the convoy system. You see, we delayed it because we did not adopt it when we started in May, and it takes a long time to get ready and to put it into operation, and we waited and waited and waited, after we had recommended it; we waited seven weeks, and my recommendation to send over 14 cruisers was not put into operation, and in the meantime they kept these vessels over on this side, at a distance of 3,000 miles from where the fighting was taking place. That is where the point comes in. That is what my criticism is about; and we are responsible for those heavy losses of life and property, and we cannot get away from it.

Senator TRAMMELL. What was the percentage of destroyers that we provided?

Admiral SIMS. For the convoy?

Senator TRAMMELL. What was the percentage of our assistance in the way of protecting the situation?

Admiral SIMS. It was very great. I will give you the figures, in a minute. There were, on the other side, a good many destroyers, but many of them were held with the Grand Fleet. They had to be in Harwich; they had to be held for a fight in case the German fleet should come out, and they were in various other necessary places. The existence of the German fleet and the possibility of its coming compelled them to keep those destroyers in those places. They were obliged to keep with them 100 destroyers to take place in a battle if the German fleet came out. They could not use them for this work.

We escorted 62 per cent, or about 1,250,000 troops of the United States expeditionary forces to Europe, without loss from enemy action. The United States destroyers escorted 27 per cent of all United States, allied, and neutral shipping carrying cargoes to England and France and Italy, during the period from April 6, 1917, to November 9, 1918, or during the duration of the war. The reason that we had such a small proportion of destroyers to the whole is because we never had more than about 70, and the Allies had about 500. The reason we were able to do so much in proportion was because so many of these allied destroyers had to be used elsewhere. As I said before, 100 of those destroyers had to be in the Grand Fleet to protect the fleet. They were down particularly in Harwich, and on the Scandinavian coast, and so forth; so that on our advices from the other side we concentrated our destroyers as far west as possible so that they would be handy to their own bases. We put them at

Digitized by Google

Queenstown first, because the facilities for repairs and refuelling with oil were better there. Brest was better strategically, and as fast as we could increase the storage facilities there for oil we took them there, until finally we had 28,000 tons of oil there, and we sent them there and our destroyers were almost exclusively used for that purpose. We did not get many submarines, because our business was not to hunt submarines but to protect the convoys and troops. If we could only have begun that thing in April, and we could have begun it if we had had our hand on our number and prepared those destroyers. Why, even after war was declared they had to go into the navy yards and stay there for days and days to get painted and fixed and scraped up. That is the point about the whole business—the delay in getting into the war in those first few months.

I think there may be some little confusion on account of what I used to say sometimes to the newspaper men who came over to the other side, that I was exceedingly embarrassed over there with some of the headlines. One can afford to be patient to a certain extent with headlines in his own country, because if a man is publishing a paper and wants to sell it, he has got to tell about his own people; but it was carried to such an extent that when these things were repeated on the other side it placed me in an embarrassing position, because, of course, the French, Italians, and others are very sensitive, and they knew that I knew all about it, and they knew that I knew that they knew, and so forth; and the consequence is that in order to implore these newspaper men to let up on the thing and state the actual facts in the case, I showed them that at a certain period, for instance at the end of the war, we had about 120 craft of all kinds there, and the Allies had about 5,000. I told them so; 4,000, 3,000; any old thing, we had only 2 or 3 per cent, and we never got over 5 or 6 per cent. But that does not alter the fact of our having been able to release from the west coast of France allied destroyers to go on their own coast, and convoying troops and convoying 27 per cent of all the allied and neatral shipping that came in there in convoys, we were able to do a very great service; and my whole contention is that we ought to have begun to do that thing in April, and we did not begin to do it whole-heartedly for six or seven or eight months, and the official records show it, by their own telegrams and my telegrams. There is no getting away from it.

Senator TRAMMELL. I suppose that when you speak about the newspaper reports, and so on, you probably make some reference—that is, you have in mind—your statement on page 61 of the hearings on naval awards, that at one time you told a contingent of reporters that the American force constituted only 3 per cent of the entire submarine forces of the Allies, and our maximum force around the British Isles was what you call a "small number." You say it runs about 5, 6, or 7 per cent.

Admiral SIMS. Well, I stated, the effective force. Of course, if you counted all the subchasers, which we used because we had them—they were one of the mistakes of the war—but at the end of the war, counting all the subchasers and supply ships and everything we had over there, there were about 370, to compare with three or four or five thousand vessels of the Allies, as you please.

Digitized by Google

Senator TRAMMELL. Did you state in a speech in London on October 10, 1918, as follows:

Another idea was sometimes in the American mind, that the American Navy had been doing the bulk of the business over here—at least a half. That was not correct. There were about 5,000 antisubmarine craft operating day and night, and the American craft numbered 160, or 3 per cent. The figures were about the same in the Mediterranean. Again, Americans seemed to regard it as a miracle of their Navy that they had got a million and a half troops here in a few months and had protected them on the way. "We didn't do that," said Admiral Sims. "Great Britain did. She brought over two-thirds of them and escorted one-half. We escort only one-third of the merchant vessels that come here."

Do you remember that?

Admiral SIMS. Yes. All those statements are substantially correct, if you take the effective craft. I eliminated from that the little subchasers that were sent there, and all sorts of small craft, and ships like that, in ports, and so forth. That was the effective forces. I gave a memorandum to the House Committee, rather a brief summary of the United States naval forces in European waters, outlining the organization at headquarters. They were asking me questions about it, and I thought it was best to get up the whole business. I have got it all down here, and you can include that in this hearing if you want to. In this connection, the following approximate percentages are of interest as giving a comparison between the naval forces of the Allied Powers.

Those were the figures, and the statement that I made in London was approximately like that, eliminating all the small craft. To give you an example of what I objected to, somebody sent me a clipping consisting of a whole page from a Boston paper, and the impression conveyed was, without an actual statement there, that we were pretty nearly doing the whole business. There was a photograph taken of the destroyer flotilla when the governors of a number of states came out there, some time before the war. We had 20 or 25 destroyers there. The artist very carefully, on the end of this photograph, jotted them down clean over the horizon. There must have been hundreds of them. This was supposed to be an actual picture of the destroyers operating in European waters. Of course they had my picture up in the corner, and all that sort of thing and all the rest of it. Those things were damaging and that was the reason I made those speeches.

The point about it is this, that after these headlines had been going on for a good while, the plain, ordinary, every day facts in the case were distasteful to a good many people, including some naval officers. They would rather have let the impression remain as it was in the headlines; but it was not possible for me and my people on the other side to get along with the war in harmony with the Allies without stating the facts. It was a situation I was confronted with that had to be attended to, that was all.

Senator TRAMMELL. Do you recall the date of the draft?

Admiral SIMS. The date of the draft?

Senator TRAMMELL. The first draft.

Admiral SIMS. I do not recall the date of it, but I recall the sensation it made on the other side. It changed the whole attitude towards us on the other side. It gave them over there their first realization, I believe, of what they had to expect from us. I think the opinion was almost universal among those peoples over there

Digitized by Google

that we were a heteregeneous mass and mixture of populations, over here, and that there was hardly any occasion could arise that would bring our people together even in spirit, and I think that was the surprise of their lives, when those ten million men registered, on the first day when we passed the conscription act. I do not remember the date. It was pretty early in the war.

Senator TRAMMELL. I think the conscription act was passed some some time in May, 1917.

Admiral SIMS. It was pretty early.

Senator TRAMMELL. Do you know whether or not the soldiers had been trained and were ready for being transported at earlier dates than they were actually transported?

Admiral SIMS. I do not know very much about that.

Senator TRAMMELL. I mean, any great number of them?

Admiral SIMS. I do not know anything about the actual figures of the thing, but I do know this, that one of the most energetic and interesting statements that I ever heard was made to our representatives by Gen. Foch who was then the chief of staff of the French Army, and the burden of the whole thing was "Send over troops! Send over troops! Send over troops! Send us the men in France. Do not wait for them to be trained; get them here. Here is the place they can be trained, where we can teach them what we have learned." I do not know how many troops we had to send, and I do not know what the period of the training was, but I do know that the insistence of the people on the other side was to get the troops over and to train them there where they could learn this new kind of warfare.

Senator TRAMMELL. You are telling us the policy of the people on the other side. I think that our people on this side felt that our men ought not to be sent over there untrained, but that they ought to have some training at home. Of course this is a matter of policy, and I agree with the American policy, instead of the policy that they wanted us to adopt.

Admiral SIMS. I have not anything to do with that, except to tell you what the Allies wanted. It does not seem to me that it has much to do with it.

Senator TRAMMELL. I think it has a good deal to do with it, because you have charged that if we had had a million soldiers there by the first of March, 1918, instead of 300,000 only, it would have made all the difference. Now I would like to know the facts, as to whether or not we had trained and training, ready to get into the fighting, a million soldiers on the first of March, 1918?

Admiral SIMS. That is a year after we entered the war.

Senator TRAMMELL. We had to take our boys and train them from the ground up.

Admiral SIMS. That is a year after we had entered the war.

Senator TRAMMELL. A great many of them had never done a day's hard work in their lives. They were not even seasoned physically. That was March.

Admiral SIMS. About a year after we had entered the war.

Senator TRAMMELL. About a year; but it was not a year after we had passed the conscription act. It was not a year after we had made the first draft; and of course, on this side we had to construct camps and everything from the ground up, absolutely. We could

Digitized by Google

not assemble our boys as they did, because we had no camps constructed, nor any place to put them. In the first place, we could have started our training a month or two sooner had we had the cantonments and the munitions and equipments and everything else. Now, the question with me is whether we were recreant in our duty in not having more men over there on the first of March, 1918, in not having 1,000,000 men there instead of 300,000 men. I think that is the important question in the controversy.

Admiral SIMS. Can we afford to take the position that in a year's time, if the tonnage had been available, plenty of it, we could not have recruited and hardened and partially trained 1,000,000 men, in view of the fact that all over Europe recruits were taken out of the dry goods stores, out of the mines, out of all sorts of places, and put in the actual fighting line inside of two or three months, and did effective work? They had to do it. The last draft that came out of Great Britain was 400,000 men. Those were recruits; I used to know some of them; they were raw men. They were put through a period of intensive training and put right on the front.

Senator TRAMMELL. They might have done that in the extremity of the case; but they did not do it in the early part of the war. I have frequently talked with a colonel of the British Army who happened to be stopping at the same hotel here, and in the early stages of the war, as far as the time concerning which you are expressing your opinion, so far as he was concerned he told me he thought our men ought to have 12 months' training; that it was almost suicidal to take men and put them right into the lines in four or five months after they had assembled in camps, men who never had seen a machine gun before or a rifle or a gun before.

Admiral SIMS. Here is what Gen. Pershing said:

> Recommendations were cabled to Washington emphasizing the importance of target practice and musketry training, and recommending that instruction in open warfare be made the mission of troops in the United States, while the training in trench warfare so far as necessary be conducted in France.

Of course, Senator Trammell, you are asking nothing but an ordinary, everyday sailor about the Army. If you would get some of these Army people up here they could tell you about that more accurately than I could.

Senator TRAMMELL. I just wanted to know whether you had taken that into consideration in your accusation against the Navy Department.

Admiral SIMS. Thoroughly so.

Senator TRAMMELL. It seems to me, in view of the fact that the Army had to be transported, and that the men who went to the front and went into the trenches and did the fighting and had something to do with the victory, the question is as to our ability to have gotten them to the front even if we had had the ships had something to do with it.

Admiral SIMS. I think it would be best to ask the Army people, who have had the experience over there, what they think about it. Of course, I did not make these accusations without having a considerable knowledge of the matter by talking with Army officers, etc., and it is my opinion that those troops should have been sent over and gotten to business as soon as possible. The effect on the morale of the Germans would have been immense. I think if no

Digitized by Google

American troops had fired a shot at all, but 2,000,000 of them had landed in France, or 1,000,000 at an earlier period, the effect on the soldiers of the German armies, as described to us in various ways, was very marked, because they had been publishing all the time, "They will never be able to get their troops over. We will destroy them with the submarine." The clamor became so insistent that Admiral von Cappelle, who was then at the head of the German Navy, after von Tirpitz was put out, made an explanation as to why it was he could not stop those troops. It is a technical explanation, about the danger of attacking, and how he would have to abandon the process of sinking merchant ships if he had gone out into the alleys through which transport troops were coming, etc.

In Gen. Pershing's report [reading]:

On December 2, 1917, an estimate of the situation was cabled to the War Department, with the following recommendation:

"Paragraph 3. In view of these conditions, it is of the utmost importance to the allied cause that we move swiftly. The minimum number of troops we should plan to have in France by the end of June is four Army corps of 24 divisions in addition to troops for service of the rear. Have impressed the present urgency upon Gen. Bliss and other American members of the conference. Gens. Robertson, Foch, and Bliss agree with me that this is the minimum that should be aimed at. This figure is given as the lowest we should think of and is placed no higher because the limit of available transportation would not seem to warrant it."

Senator TRAMMELL. By that time do you know about what number of troops we had there?

Admiral SIMS. December, 1917? Yes; we did not have, up to March——

Senator TRAMMELL. I mean at the time he estimated we should have a certain number.

Admiral SIMS. Yes, sir; it is given in this report. Even up to the beginning of the great drive we only had 300,000 troops altogether in France, up to March, 1918; and the big transport of troops began in April, 1918, at the rate of 300,000 a month after that. Just how many there were here in December, 1917, I do not know. There were probably about the same number, 250,000 to 300,000 only.

Senator TRAMMELL. He said he would like to have a certain number by June, was it not, 1918?

Admiral SIMS. Planning to have in France by the end of June?

Senator TRAMMELL. The end of June?

Admiral SIMS. His language is:

The minimum number of troops we should plan to have in France by the end of June is four Army corps of 24 divisions in addition to troops for service of the rear.

Senator TRAMMELL. Did we not have approximately that many there at that time?

Admiral SIMS. We had 250,000 to 300,000.

Senator TRAMMELL. No, I am talking about the last of June, 1918. Did we not have approximately the troops that he had requested?

Admiral SIMS. June? We have the figures here. This was December 2, 1917. There were 176,665 American troops in France, and but one division had appeared at the front. I think I read that to you yesterday. That is December 31, 1917. This is from the report of Gen. Pershing. Here is a little extract from Gen. Pershing's report. He says on page 8 of his report [reading]:

After duly considering the tonnage possibilities I cabled the following to Washington on July 6, 1917:

"Plans should contemplate sending over at least 1,000,000 men by next May."

Digitized by Google

I had forgotten where I got that statement. That was sent on July 6, 1917, or only a few months after we entered the war. He telegraphs that the plans should contemplate sending over at least 1,000,000 men by next May, which would be May, 1918.

Senator PITTMAN. What was that second report he made that you read from, Admiral? At a later date he said that he wanted them there by the last of June, did he not?

Admiral SIMS. Here is an extract from a cable of Gen. Pershing to the War Department on December 20, 1917 [reading]:

The actual facts are that shipments are not even keeping up to that schedule. It is now the middle of December and the First Corps is still incomplete by over two entire divisions and many corps troops. It can not be too emphatically declared that we should be prepared to take the field with at least four corps by June 30. In view of past performances with tonnage heretofore available such a project is impossible of fulfillment, but only by most strenuous attempts to attain such a result will we be in a position to take a proper part in operations in 1918. In view of fact that as the number of our troops here increases a correspondingly greater amount of tonnage must be provided for their supply, and also in view of the slow rate of shipment with tonnage now available, it is of the most urgent importance that more tonnage should be obtained at once as already recommended in my cables and by Gen. Bliss.

That simply accentuates the point I have been endeavoring to make, that if we had gone into the war promptly with all our anti-submarine forces we would have had that tonnage to carry those troops over which Gen. Pershing says we did not have at that time, because if, after the intervention of our forces, the successive decreases of tonnage were as shown, in the first place 640,000 tons, in the next period 390,000 tons and in the next period 250,000 tons, it is as plain as a pikestaff that if we had begun that intervention four months earlier, we would have in those four months saved two and a half million tons of shipping which we saved in the subsequent four months, or after the first four months, and therefore Gen. Pershing would have had the shipping and he would have had the troops over there as he wanted to have them.

Senator PITTMAN. Admiral, if I understand you, the loss of life was caused by the failure of the arrival of our troops on the front, to terminate the war; that is what I understood.

Admiral SIMS. Would you mind repeating the first part of that question?

Senator PITTMAN. I understand your reasons for believing that the war was continued for four months longer, with the consequent loss of life, was due to the failure of a sufficient number of our troops to arrive on the western front.

Admiral SIMS. That is one of the elements; yes. When our troops did arrive on the west front, it had a very marked effect, particularly upon the morale of the German Army and the German population, who had been told all the time that they could not get there, and that the submarine campaign would turn us down, etc., and so on. The discouragement was intense, as we found out from prisoners, and so on. That is one of the elements of the thing.

Senator PITTMAN. Of course 300,000 men might have affected the morale of the British Army or the French Army; but the thing I am getting at is the excuse you give for the loss of life. It was the lack of man power on the west front, was it not?

Admiral SIMS. Partially.

Digitized by Google

Senator PITTMAN. Partially. Well, I can not comprehend yet how we could have won this war without man power on the west front.

Admiral SIMS. I think you were not in the room here when I went over the tonnage situation with Senator Trammell. I think you had left, then. I would like to invite your attention to this little summary.

Senator PITTMAN. I do not care anything about the tonnage. The sole question I have in my mind is this; This war was on the west front. Of course I realize there were a great many questions involved in the winning of that war; but as a matter of fact it was the soldiers driving through that finally won out in this war. The getting of the soldiers there was essential, also. But the question is, Were the soldiers prevented from getting on the west front by reason of the Navy?

Admiral SIMS. No.

Senator PITTMAN. By reason of our Navy?

Admiral SIMS. By reason of the lack of merchant tonnage; by reason of the loss of merchant tonnage of two and a half million tons on account of our four or five months' delay in getting effectively into the war.

Senator PITTMAN. Do you know how many men were obtained in the first draft drawing in August?

Admiral SIMS. I do not, but I know that Gen. Pershing wanted over a million men there on May 1, and could not get them.

Senator PITTMAN. Do you know when the next drawing took place and how many men there were?

Admiral SIMS. No, sir.

Senator PITTMAN. Or the next?

Admiral SIMS. No, sir.

Senator PITTMAN. Do you know why they did not draw them all out?

Admiral SIMS. No, sir.

Senator PITTMAN. Do you know that soldiers were held here on this side because they could not get transportation?

Admiral SIMS. Yes, I do.

Senator PITTMAN. You do know that?

Admiral SIMS. Yes; so I understand.

Senator PITTMAN. You understand it? From what report do you obtain that?

Admiral SIMS. I know this, that when the crisis came and there was consternation over the drive on the western front, the tonnage that was then in operation and available to bring the people over, it was not there, and they had to divert tonnage, in their extremity, from all parts of the world in order to get over 300,000 troops a month.

Senator PITTMAN. If, as a matter of fact, the soldiers found transportation whenever they were in preparation, according to the American ideas, in order to go abroad, then your whole charge that the Navy is responsible for the loss of 500,000 lives has no foundation; is not that true?

Admiral SIMS. Will you repeat that again? If what?

Senator PITTMAN. If, as a matter of fact, the Navy was prepared and did transport, or rather saw to the transportation of, troops when they were ready, then your whole foundation falls, no matter how small the transportation was?

Digitized by Google

Admiral SIMS. If that is true, then Gen. Pershing was entirely wrong about the whole business. I am only judging by what he wanted.

Senator PITTMAN. That is the sole answer? That decides the question, does it not?

Admiral SIMS. No; not at all, because they insisted on the other side and advised on the other side, with all their experience of the trench warfare, that you send the troops right over, and Gen. Foch said he pounded his fist on the table and said, "Marche, marche! Send the men over here."

Senator PITTMAN. I am not talking about what Gen. Foch said, or what Admiral Bayly said or any other foreigner. This country had established a policy of training. I ask you if, when the men were ready according to the decision of the American Army staff, to go abroad, the transportation was not ready for them as they were ready?

Admiral SIMS. If it was not ready for them?

Senator PITTMAN. Yes.

Admiral SIMS. What is the question?

Senator PITTMAN. It is a very simple question.

Admiral SIMS. I know, but——

Senator PITTMAN. As these American soldiers were ready, in accordance with the decision of the American Army officers and the Army staff, if transportation was not then ready for them, as they were ready?

Admiral SIMS. If it was ready for them?

Senator PITTMAN. Yes.

Admiral SIMS. But it was not, though.

Senator PITTMAN. Where is your evidence of that?

Admiral SIMS. Because they had to bring in transportation from all over the world to bring them there in time.

Senator PITTMAN. But they got there?

Admiral SIMS. They got there; but, great scott, if they had got there a year before, we would not have lost all those people.

Senator PITTMAN. Yes, I understand; but do you not know——

Admiral SIMS. You do not need to point your finger at me. It does not do the least bit of good.

Senator PITTMAN. I will use my own judgment about that. You are not now on the bridge of a ship.

Admiral SIMS. I would like to ask, as a special favor, that you do not adopt those methods of the police court lawyer here.

Senator PITTMAN. It is the only method, apparently, that brings you down to the proper courtesy due to the United States Senate.

Admiral SIMS. I do not think it is a good thing, do you, for you to point your finger at me? I do not think it is a good thing, really, now.

Senator PITTMAN. If it makes the Admiral uneasy——

Admiral SIMS. It does not make me uneasy.

Senator PITTMAN. But answer my question, now, Admiral.

Admiral SIMS. Certainly; I will be glad to.

Senator PITTMAN. If you please. The troops were being prepared much more rapidly in April, 1918, than they were in the fall of 1917; is not that true?

Admiral SIMS. I do not know, at all.

Digitized by Google

Senator PITTMAN. You do not know?

Admiral SIMS. I do not know whether they were prepared more rapidly in 1917 than in 1918.

Senator PITTMAN. Is it not natural that the rate of preparation of the soldiers in 1918 was far more rapid, with the greater facilities that they had in 1918, than in 1917?

Admiral SIMS. Oh, you have turned it around, now. I understand what you mean. I think you inadvertently said 1917 when you should have said 1918.

Senator PITTMAN. You said you did not know. I ask you again.

Admiral SIMS. The facilities in 1918 would necessarily have been better than those in 1917.

Senator PITTMAN. They were, undoubtedly?

Admiral SIMS. Yes.

Senator PITTMAN. They were turning out more prepared soldiers then than they were in 1917?

Admiral SIMS. I suppose so. I do not know.

Senator PITTMAN. You would assume so? It was natural?

Admiral SIMS. You can assume it. I do not know anything about it.

Senator PITTMAN. If you do not know anything about it, I think it is a very serious charge to make against the Navy of the United States that it is responsible for the loss of 500,000 men, when you know nothing about the facts that is most material, and that is whether the soldiers were as prepared to go in 1917 as they were in 1918.

Admiral SIMS. Prepared to go?

Senator PITTMAN. Yes.

Admiral SIMS. They were there. They were enlisted and they were in uniform and soldiers; and soldiers were sent over that had only been in uniform, when the crisis came, less than 10 days; and they could have been sent over in the early part of the war the same way, but they were not because they did not have the tonnage to do it with.

Senator PITTMAN. Have you any evidence at all or any reports of any statements that soldiers were prepared by the Army and asking for transportation anywhere along in September, October, or November, 1917, and that they did not find transportation for them?

Admiral SIMS. September, October, and November?

Senator PITTMAN. 1917.

Admiral SIMS. I have not any official documents here to that effect; no.

Senator PITTMAN. You have not?

Admiral SIMS. No. We were transporting about 25,000 men a month; and in the official records it shows that they were telling us that they had 16 vessels that were available for that, only. This is from Gen. Pershing's report. [Reading:]

> The lack of ocean tonnage to carry construction material and animals at the beginning was serious. Although an increasing amount of shipping became available as the war progressed, at no time was there sufficient for our requirements. The tonnage from the States reached about seven and one-half million tons to December 31, 1918, which was a little less than one-half of the total amount obtained.

That would seem to answer the question, that there was not enough shipping.

Senator PITTMAN. Oh, there was not enough shipping.

Digitized by Google

Admiral SIMS. To transport the troops.

Senator PITTMAN. We all know that there was not enough shipping to give the Allies and their populations all the men and materials they wanted to have.

Admiral SIMS. This does not say "the Allies" at all. It says reading]:

The lack of ocean tonnage to carry construction material and animals at the beginning was serious.

That is, American construction material to build up the ports of France and American animals. [Continuing reading:]

Although an increasing amount of shipping became available as the war progressed, at no time was there sufficient for our requirements.

That answers your question, absolutely. "There was at no time sufficient for our requirements." We lost two and a half million tons of shipping, and we did not have sufficient shipping to carry our troops over.

Senator PITTMAN. There no doubt never was sufficient for our requirements, as Mr. Hoover has testified, and everyone knows; but they did get enough food there to live on; and we come back to the question whether or not the soldiers of this country were transported or could not get transportation?

Admiral SIMS. According to Gen. Pershing they wanted a million soldiers there by a certain date and could not get them because he did not have enough shipping.

Senator PITTMAN. When did we first draw soldiers? Was it not in August, 1917?

Admiral SIMS. When did we first do what?

Senator PITTMAN. Have our draft of soldiers?

Admiral SIMS. I am not sure about that.

Senator PITTMAN. I think it was in August, 1917. I think so. Just how long did it take them to assemble? I just want to draw your attention to the fact that we did not have any army in 1917 to transport.

Admiral SIMS. Then Gen. Pershing must have been mistaken in supposing that they did have an army and that they did not have enough shipping to transport them. Now, you can not get away from that thing. Gen. Pershing said that he wanted troops sent over, so that they must have been here; but he says they did not have enough transportation to carry them.

Senator PITTMAN. How much of an army did we have when the war began?

Admiral SIMS. We did not have more than 25,000 or 30,000 effective troops.

Senator PITTMAN. It did not take very much tonnage to transport them. Now, the draft occurred in August. Under the policy established by our Army, which I assume the Navy has nothing to do with, those men required an intensive training there.

Admiral SIMS. Gen. Pershing said that they were ready to go over and he did not have the ships to bring them.

Senator PITTMAN. The fact remains, Admiral, that you have charged that the Navy is responsible for the loss of 500,000 men by reason of the failure to get our troops to the west front.

Admiral SIMS. I believe so.

Digitized by Google

Senator PITTMAN. You can not substantiate that statement, sir, unless you can prove that the Army was relying upon them for the transportation to transport them, and they could not do it.

Admiral SIMS. There you are. Gen. Pershing said that he wanted a certain number of men by a certain time, and they could not get the shipping to transport it, and if you want any more evidence——

Senator PITTMAN. You not only have not given that evidence, but, in fact, you could not, and those facts will be demonstrated here absolutely when the time comes—that there is no foundation for that assertion.

Admiral SIMS. Then you must refute Gen. Pershing's own report to the President.

Senator PITTMAN. No; we do not have to.

Admiral SIMS. Yes; you do, because he said that he wanted the troops and did not have the transportation to get them there.

Senator PITTMAN. Oh, no.

Admiral SIMS. Well, yes; now, really.

Senator PITTMAN. You have read what is there.

Admiral SIMS. Here is another quotation. Here is "Organization Projects." [Reading:]

9. A general organization project, covering as far as possible the personnel of all combat, staff, and administrative units, was forwarded to Washington on July 11. This was prepared by the operations section of my staff and adopted in joint conference with the War Department Committee then in France. It embodied my conclusions on the military organization and effort required of America after a careful study of French and British experience. In forwarding this project I stated:

"It is evident that a force of about 1,000,000 is the smallest unit which in modern war will be a complete, well-balanced, and independent fighting organization. However, it must be equally clear that the adoption of this size force as a basis of study should not be construed as representing the maximum force which should be sent to or which will be needed in France. It is taken as the force which may be expected to reach France in time for an offensive in 1918 and as a unit and basis of organization. Plans for the future should be based, especially in reference to the manufacture of artillery, aviation, and other material, on three times this force, i. e., at least 3,000,000 men."

And the fact remains that according to Gen. Pershing he wanted the troops over there and could not get them because there was not sufficient tonnage; and there was not sufficient tonnage because two and a half million tons were clearly lost by the delay of the American Navy in going into the war.

Senator PITTMAN. According to his report he wanted 1,000,000 men there for the campaign, 1,000,000 American soldiers for the campaign of 1918. He got the 1,000,000 soldiers there in the first week of July, 1918. They participated in the fights, in the campaign of 1918, and participated in the victory. I was in hopes that you had made a study of the military situation over here, as you apparently had in France.

Admiral SIMS. I thought that I could rely upon the accuracy of the report made by Gen. Pershing to the President.

Senator PITTMAN. You have not discussed this matter with Gen. Pershing at all, have you?

Admiral SIMS. What?

Senator PITTMAN. You have not discussed this matter with Gen. Pershing, have you?

Digitized by Google

Admiral SIMS. I have not seen him at all since we were in France.

Senator PITTMAN. No. But you must realize, Admiral, the conditions that existed here at the beginning of the war; although you left before it commenced, as has been stated by Senator Trammell. As you said, we practically had no army in the beginning of the war. I do not think that is the Navy's fault. We had no facilities for training at the beginning of the war. I do not think that is the Navy's fault. The policy decided by the War Department in our country was to train our soldiers on this side. I do not think that is the Navy's fault. And, as a matter of fact, until the beginning of 1918 it must be evident to you that we had very few soldiers to send anywhere; and then they commenced to come on all at once; and when they came on all at once, the combined navies of the world and the ships of the world got the food there to France, they got the amount of troops to France that Pershing said he would need, and won the war in 1918. I do not think there is any blame attached to the Army; I do not think there is any blame attached to the Navy; and I think that you ought to take back the assertion that the Navy is guilty of the murder of 500,000 people, until you produce some evidence stronger than you have produced.

Admiral SIMS. It seems to me that the evidence that I have produced shows very clearly that the Navy is responsible for the loss of those men and those billions of treasure. As I said to Senator Trammell, it all depends upon whether you assume that the intervention of the Navy was effective, or whether it was not. If it was effective, it decreased the length of the war, and if it delayed in making it effective, it prolonged the war. When the Navy intervened and the convoy system was put in operation, there was a decrease in loss of shipping. It began in a certain period.

If it had begun earlier, we would have saved just so much shipping; and if we had had that shipping we could have sent troops faster to France, and we would have done it, there is no doubt about it at all, because Gen. Bliss in his first visit over there and on coming back again said they had to get a million men over there as soon as possible, and they did not have the transportation to do it at that time.

Senator PITTMAN. Well, it was effective; and you do not have to take the position that it was either effective or not effective, at all. It was not effective as it would have been if Congress had appropriated money for more ships years before; but it was sufficiently effective to get over to France every soldier that we had trained to go to France.

Admiral SIMS. Congress did not appropriate as much money as the Navy would have liked to prepare for war, but that is not the point, at all. We are not criticizing Congress for that, at all. It is the fact that the antisubmarine forces we had were on this side, 3,000 miles from where the fighting was going on, and that they were not sent over, actually. We declared war on the 6th of April, and there was not a single force on the other side until the 4th of May. What do you know about that for preparation for war. And I can give you the dates that they arrived—another bunch of ships—and I can show you that after two months there were only 30 destroyers there. I can show you that at the end of a whole year there were approximately 120 vessels of all classes, including supply ships. Not

Digitized by Google

one of those ships was built since the war. There was no reason why they could not have been all sent over immediately upon the declaration of war, and if they had been there, we would have put the submarine campaign out of operation, and decreased the losses. I do not know why they did not send them over there. The good Lord only knows why they did not send them over there, but they did not send them, at all.

Senator PITTMAN. There were only two things they sent over there, men and provisions for the war.

Admiral SIMS. Yes.

Senator PITTMAN. All they wanted over there first was man power, man power, just as you have stated. They had everything else but man power. We got every soldier to France for the campaign of 1918——

Admiral SIMS. That the tonnage would carry.

Senator PITTMAN (continuing). That was ready for it; and that is incontrovertible by the evidence.

Admiral SIMS. The German offensive began on the 21st of March. At that time the great American Nation had 300,000 men only in France, and they had to call in the shipping from all over the world, which they were enabled to do at that time because the curves had crossed. But for that fact they would not have been able to do it; it would have been too dangerous to do it, because you would have starved the allied armies. At the end of March, within a year, we had 300,000 men in France.

Senator PITTMAN. Yes; and in August we did not have any in the United States.

Admiral SIMS. What is that?

Senator PITTMAN. In August we had none in the United States. In September we had none in the United States. In October we had none in the United States. We had recruits that were being trained.

Admiral SIMS. They had men in the Army. They must have had.

Senator PITTMAN. We had no camps for them.

Admiral SIMS. If you had had ships, they would have put them on the ships and taken them over, like every other country that send their troops.

Senator PITTMAN. But that is not involving the Navy Department. The War Department decided they would not send them until they were trained.

Admiral SIMS. Was that the reason, because they were not trained troops, that the Navy Department held their antisubmarine forces on this side where the fighting was not going on?

Senator PITTMAN. That is another side-step of yours, Admiral.

Admiral SIMS. Not at all. I asked if that was a part of that plan, that they did not send the antisubmarine forces over there.

Senator PITTMAN. You have been trying to get away from the facts all the time, and because you do not know the facts you have made a false assertion without any knowledge of the facts.

Admiral SIMS. Not without knowledge of the facts. I have based it on the report of Gen. Pershing to the President.

Senator PITTMAN. But you do not know anything about the facts on this side of the war, and it will be demonstrated before you get through with it. But you have assumed that we had a million soldiers there.

Digitized by Google

Admiral SIMS. Not at all. I never said so.

Senator PITTMAN. You read it, shipment, by the time that we were there——

Admiral SIMS. Will you fix that thing now? I did not say they were there, on the other side. I said they wanted the men shipped over there as soon as possible.

Senator PITTMAN. Well, your complaint is against the War Department and not the Navy.

Admiral SIMS. Not against the War Department.

Senator PITTMAN. For not shipping a lot of green men over there to be slaughtered.

Admiral SIMS. Like everybody else did. You know as well as I do, Senator Pittman, that we put the greenest possible men onto the western front. They put men there who had not been in uniform more than two or three or four months. We had to do it. But we would not have done it, in the first place, if we had had the transports; but we did not have the transports and could not get them there, with any endeavor. We had 16 transports only taking them there; straining every nerve to get them across.

Senator PITTMAN. As a matter of fact, on November 2, 1917, did you not report to the Secretary of the Navy as follows?

Admiral SIMS. What is that, please?

Senator PITTMAN. This report of yours on November 2, 1917, I am asking you about. [Reading:]

16. I consider Liverpool the safest port of entry in the submarine area. For the present, however, I think we shall have to send our large ships to Brest Roads and then, when they are unloaded, escort them to England to be coaled.

17. I have previously reported against using the *Vaterland* for the present until we have a little more experience in handling the other large transports. The *Vaterland* is, of course, a much longer target, and injury to her would be a serious affair. I am assuming too that all of the troops that we have to transport for the next few months can be accommodated in other transports, assisted by British liners. Whenever the situation becomes pressing I presume we shall have to use the *Vaterland* and take the additional risk.

Admiral SIMS. The nautical questions involved in that are that the *Vaterland* had no wharf to go alongside of in Brest, and she could not be coaled in Brest, because we would have to transport coal to Brest, and then she would have to go into Southampton, and through the submarine area.

Senator PITTMAN. The matter that attracted my attention was this [reading]:

I am assuming that all the troops we have to transport in the next few months can be shipped in other transports, assisted by British liners. Whenever the situation becomes pressing, I assume we shall have to use the *Vaterland*, and take the additional risk.

So that it was not pressing on November 2?

Admiral SIMS. According to Gen. Pershing it was very pressing, and he had not the transports to get them over.

Senator PITTMAN. Then you gave a wrong report to the Secretary of the Navy?

Admiral SIMS. It is quite possible, through ignorance of the military situation, that I might. But we can not get away from Gen. Pershing's report, really.

Senator PITTMAN. But that was your duty over there, to find out the facts.

Digitized by Google

Admiral SIMS. Not at all.

Senator PITTMAN. You did not have anything to do with the transportation of troops?

Admiral SIMS. Of troops?

Senator PITTMAN. Yes.

Admiral SIMS. Nothing at all, except to escort them in.

Senator PITTMAN. Then you do not know anything about the transportation of troops?

Admiral SIMS. Yes, I do, because I have read Gen. Pershing's report.

Senator PITTMAN. Have you had any conversation with any of your other officers who had anything to do with the transportation of troops?

Admiral SIMS. Yes, I have seen lots of them.

Senator PITTMAN. Have you based it on anything they said to you?

Admiral SIMS. Based what?

Senator PITTMAN. Your statement about this?

Admiral SIMS. No; I based it on Gen. Pershing's report.

Senator PITTMAN. What is the date of that report?

Admiral SIMS. September, 1919.

Senator PITTMAN. Was that the first time you knew there was pressure for the transportation of troops?

Admiral SIMS. That there was pressure?

Senator PITTMAN. Yes.

Admiral SIMS. Oh, no; I had known it in a general way; but I had not known it officially.

Senator PITTMAN. You did not know it on November 2, 1919?

Admiral SIMS. I did not know it as well as I did later. That was pretty early in the game, you know.

Senator PITTMAN. That was the time you are complaining that you have been transporting troops very little.

Admiral SIMS. Yes; but the fact whether I knew or not has not anything to do with the case, as compared with Gen. Pershing's report.

Senator PITTMAN. You are relying upon that report fory our charge against the Navy?

Admiral SIMS. For the official part of the information. Surely, I thought that was pretty good evidence.

Senator PITTMAN. It bears on the construction you put on it, as to what it means.

But, nevertheless, you come back to the very same proposition that you have nothing excepting such conclusions as you can draw from that report of Gen. Pershing, to sustain your charges that our soldiers did not get to the front by reason of the failure of the Navy?

Admiral SIMS. That is your statement, but that is not mine. I read a statement here of the tonnage situation, and showed very clearly, I thought, just what the tonnage was. That was my idea of the thing. I think that the evidence I produced there from the shipping figures, etc., amply substantiates that fact, that the delay in getting into the war cost us those lives and those billions of dollars.

Senator PITTMAN. Do you not think, as a matter of fact, Admiral, that the shortage of tonnage that you have referred to resulted in a

Digitized by Google

shortage of foodstuff, as testified to by Mr. Hoover, and that they sacrificed foodstuffs; but they did not sacrifice the transportation of troops?

Admiral SIMS. They had to do both. It was very, very dangerous, I think. When Mr. Hoover told me that the actual food supply in England, what he called here in his testimony—I have forgotten the technical term of it, but it means the supply in stores, not counting the ones in the retail stores, was only three weeks, that was very serious. Now, if the transportation of troops continues under those circumstances, without the possibility of supplying them after they got them there, there is where the danger of the thing comes in, as Gen. Pershing points out in his report. I will admit it was a matter of astonishment to me that they would want 50,000 tons of freight landed in the ports of France per week. If you put a million men in there, you have to give them that. They cut down on the food supply in those countries, I think, as far as they dared. When you get down below a certain point, you know what happens, as you see from the conditions in Germany. They reduced those supplies down considerably below that danger point. They reduced the supply of bread considerably, and cut out that of sugar almost entirely, and reduced all supplies all along the line, as far as they dared. The food-supply situation was extremely dangerous, and there was great anxiety, as Mr. Hoover has testified.

Senator PITTMAN. Mr. Chairman, in order to make the testimony complete in regard to the line I was taking this morning, I would like to have the testimony of Mr. Byrnes and Senator Glass and of Admiral Sims also in connection therewith, included in this record at this point this morning, where we leave off. I refer to the testimony of Admiral Sims in connection with that of those two witnesses only with regard to the one subject, and that is those letters.

The CHAIRMAN. Very well. It is so ordered.

(The testimony is as follows:)

STATEMENT OF HON. JAMES F. BYRNES, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF SOUTH CAROLINA.

Senator PITTMAN. Mr. Byrnes, you are a Representative, are you not?

Representative BYRNES. I am.

Senator PITTMAN. How long have you occupied that office?

Representative BYRNES. Since the Sixty-second Congress; nine years, now.

Senator PITTMAN. A statement made by you on the floor of the House of Representatives recently was introduced in evidence a few days ago by the Secretary of the Navy, when testifying before this committee. That statement has been contradicted to a certain extent, as the evidence will disclose, by Admiral Sims in his testimony this morning. The portion of the speech that I refer to is as follows [reading]:

"In October, 1918, with two of my collegues, Representative Glass, of Virginia, and Representative Whaley, of South Carolina, I went to France, and among other other places visited Tours, the headquarters of the Services of Supply of our Army, and was thrilled with pride at the marvels worked by this branch of the service. On October 30, with my colleagues, I saw Admiral Sims, who was then in Paris. I shall never forget that interview. The armistice had been requested by the enemy. Sims told us of the magnificent progress made by the British on the English front, and as we listened he proceeded to tell us that the armistice would have to be granted, because Pershing had been unable to break through the German lines, owing to the absolute breakdown of transportation behind the American lines. With pathos in his voice he told us how unfortunate it was that this breakdown occurred at so critical a moment. In amazement we listened, and in the monologue he delivered he proceeded to tell us that while Americans believed their Navy was working wonders, that as a matter of fact we had but 3 per cent of the antisubmarine craft in English

Digitized by Google

waters; that Great Britain had brought over two-thirds of our troops and had escorted one-half of them. I left him not only depressed at the failure of the American Army, but humiliated at the small part played by the American Navy. Believing that this disaster to the American Army, which, according to Sims, made necessary our granting the armistice, asked by the enemy, was destined to be a national scandal, Mr. Whaley and I determined to again visit the headquarters of the Services of Supply in order to ascertain the details of this disaster. Because of Sims's statement we traveled 150 miles or more to Tours. When we informed the commanding officer and the Chief of Staff of our desire to secure information with reference to this matter they were amazed. They advised us that it was the first time they had heard of it. They showed us records where Gen. Pershing, after the St. Mihiel drive, had thanked the Services of Supply for its wonderful service, and again, just a few days prior to our visit, had written congratulating the Services of Supply upon its continued success in supplying our forces in the field. Wishing to avoid friction between our officers, we refrained from disclosing the source of our information.

"When told that our statement must be mere gossip in Paris, we advised the commanding officer that our information came from an officer of high rank in the service of our Government, and in response to that statement an officer present said: 'That is nothing but British propaganda, and the only American officer who could have told you gentlemen this story is Admiral W. S. Sims.'

"While in London, in visiting the naval headquarters to secure information as to the departure of ships, we again met Admiral Sims. He courteously invited us to his office, and evidently forgetting that he had delivered his lecture to us in Paris, he again proceeded to impress upon us the small part our Navy played in the war, reciting the figures stated above, and which I have proved to be false. Not satisfied with telling us how small a part we played upon the sea in time of war, he proceeded to tell us that in time of peace we should seek to play no part at all. He expressed the hope that we would not be led astray by the agitation for a merchant marine. He declared that England, because of her geographical location, must necessarily control the seas, and that we could rely upon her at all times providing a merchant marine to transport our goods to foreign markets. When I took issue with him, he stated that even if we entertained the view that it would be desirable for the United States to possess a merchant marine, that it was impossible because we could not compete with Great Britain; that it would be necessary to pay subsidies, for which our people would never stand; and that it was the part of wisdom for us to develop the great West and leave the sea to Great Britain. With that Government, he said, we would never have any trouble, and Great Britain could be depended upon at all times to care for our business upon the seas."

Was that a part of a speech delivered by you, Mr. Byrnes, in the House of Representatives?

Representative BYRNES. It is.

Senator PITTMAN. On what date, do you remember now?

Representative BYRNES. January 27.

Senator PITTMAN. This morning when Admiral Sims was testifying with regard to that portion of your speech which was introduced in evidence and which I have just read, he testified as follows [reading]:

"Now, I should like to make a statement in reference to what Mr. Daniels had to say about the remarks of Representative Byrnes in the House. I am sorry to say that Representative Byrnes got his statement very badly twisted. As I read it in the press, he said that I told him that Gen. Pershing's army practically went to pieces behind the Argonne front, and that as a result of that is was necessary to ask for an armistice, or to accept the armistice.

"It is quite true that I told this to Representative Byrnes, and I warned him to be careful that he would hear it everywhere, and that he must not believe it or repeat it.

"I not only told it to him, but I told it to every Congressman or Representative who came through London at that time and whom I saw. I told it to all of the prominent Americans that I could get in contact with. Of course, you know that in a war there is always jealously not only between armies of different nationalities, but between the branches of your own Army, and these stories if they are not checked: For example, I was told by an American correspondent whose name is probably known to you all, who was an officer during the war—he was a liaison officer with some of the British troops with whom our troops were serving. He spread his hand out and he said: 'These are all American Army corps. If you walked up into this Army corps at headquarters and talk to them they will curse out the American Army corps on each side of them and say that in the last offensive they were not properly supported. Now, when you come to an American Army corps with a British or French corps on the other side, the same criticisms are made.'

Digitized by Google

"It was that I was trying to get these Americans to understand, and I did not fail to make that statement to all the prominent Americans who came through. Mr. Byrnes is mistaken in supposing that I was the authority for this. I was simply telling him what was going about, so that when he went down onto the Continent and got into contact with all classes of people in Paris, he was not to believe any such yarns."

The CHAIRMAN. Senator Pittman, would it not be well to read all of the testimony in regard to this matter, of this morning?

Mr. BYRNES. I wish you would.

Senator PITTMAN. It probably would be. Continuing where I left off with the testimony of Admiral Sims [reading]:

"I remember hearing an officer in our service, who was a bit of a wag, say to one of the younger officers, when they were discussing a matter of this kind: 'If you ever get surprised at sea in a fog, or anything, sing out "Hard aport," and they will not take your ship away from you; but if you do nothing they will.'

"The CHAIRMAN. Admiral Mayo also said—perhaps I should correct what I said about his statement before. He said that he understood that that was the policy.

"Admiral SIMS. Yes, sir.

"The CHAIRMAN. He did not say authoritatively that it was the policy.

"He also stated—I will look up his testimony so as to quote it exactly.

"Senator PITTMAN. While you are looking that up, may I ask a question?

"The CHAIRMAN. Very well.

"Senator PITTMAN. Admiral, I do not presume you had the record before you in regard to the charges made by Congressman Byrnes?

"Admiral SIMS. I only had what was in the paper, Senator.

"Senator PITTMAN. I think you are entitled to have the exact language of it. His language was taken from a written speech made on the floor of the Congress. The excerpt from it, which was placed in the record, is as follows.

Then the part of your speech which I have just read to you was read aloud. I then continued with my question to Admiral Sims as follows [reading]:

"I think that is the end of the quotation from Mr. Byrnes. Now, having that statement correctly before you and not having to depend upon a newspaper account of it, I will ask you if that statement is true?

"Admiral SIMS. It is not, and I can not understand how any such idea could have gotten into his head, because I never entertained those views. I was very much exercised about this rumor that was going about, about the operations behind the Argonne front. It came to me in a number of ways, through Paris, and so forth, and, as I said before, I took advantage of having this information that came to me that way, because I had many sources of information, to explain to these people. Now, my opinion of the Army, I think, is perfectly well known. You can ask Gen. Pershing what it is. But those criticisms are always there; and the only explanation I can make of it is that these gentlemen in their trip through Europe, and with all the people they had talked to, and so forth and so on, with all this, you can call it propaganda if you want to, but I do not think it was that; I think it was just natural jealousy that arises between armies; they got the thing mixed up, that is all. I have never held any such opinions at all.

"As to the merchant marine, it is a surprise to me that anybody should tell me that I have expressed any opinions about it, because I never had any. I may have said, of course, that there may be some difficulty or competition, as everybody knows there may be; but as to whether Great Britain, on account of 'her geographical position'—a remark which, to my mind, does not mean anything at all—should have all the shipping of the world, and we should depend upon it, I can not imagine how any such idea should have arisen at all.

"As for the relative amount of the work that our Navy did on the other side, one of the things I tried to get into the minds of the people that came over there, one batch after another of newspaper people, etc., and also Congressmen that came through, was to get some just idea in the minds of the American people as to what our Navy had done over there. Now, anybody who has had the curiosity to read the articles that I have written since last September will see that I have done the best I could with my limited literary ability to express my very high appreciation of the magnificent work that was done by our Navy on the other side. It is not depreciating the work of our Navy to make the simple statement that we had about 3 per cent of the Navy antisubmarine forces. I do not remember the figures, now, but it was something like 175 vessels at that time that we were using in antisubmarine work, not counting the small fry, and that the other people, including all the Allies, had about 5,000. Surely it is not depreciating the magnificent work that I have described in these articles, of our forces, to state that they were not as big as the other fellows. It is an absolute fact, that is all; and the contrary in the headlines of our papers, that

Digitized by Google

we did the whole business, was hurting us on the other side, and was making difficult our relations with the Allies; and that is what I sought to correct. In two or three speeches at luncheons, etc., where these American correspondents were entertained, I said, 'Give the American people the truth of this matter so that you will not keep on embarrassing us on this side by saying things which of course we know to be not true, the Allies know to be not true, and which the Allies know that we know are not true. It makes it difficult for us; that is all.'

"As for the British bringing over two-thirds of the troops, I said that they brought over during the rush after the first year of the war, beginning in April, 1918, about two-thirds of the troops. It is about that; 59 or 60 per cent, or something of that kind. That is also true. That certainly does not depreciate the magnificent effort that we made to bring over the rest of the troops.

"Senator PITTMAN. That portion of Mr. Byrnes's statement, then, is not incorrect?

"Admiral SIMS. That portion is not incorrect. That is not incorrect.

"Senator PITTMAN. The first portion here where he says, 'Sims told us of the magnificent progress made by the British on the English front,' I take it is correct. 'And as we listened he proceeded to tell us that the armistice would have to be granted because Pershing had been unable to break through the German lines owing to the absolute breakdown of transportation behind the American lines.'

"Admiral SIMS. That is exactly what I told him, yes, and warned him not to believe it. That is what I did tell him. And it was, of course, absurd. I warned him not to believe it.

"Senator PITTMAN. You warned him that it was not true and not to believe it?

"Admiral SIMS. I am perfectly positive that I warned him that it was not true. That was my whole object in telling him.

"Senator PITTMAN. Did you notice anything else in the rest of Mr. Byrnes's statement that would indicate that he could have so understood you?

"Admiral SIMS. The only thing I can think of is that he had talked to a great many people, in my headquarters, and a good many people in Paris, naval officers and Army officers, etc., and he has got the thing mixed up; that is all,

"I can not conceive anything else, because I never had any such idea at all, and was distressed that this rumor came about. It seemed to indicate that it was set on foot by these jealousies, after the war was over. Then was when they broke out. That is to say, when the enemy asked for an armistice, there was a flood of these criticisms, and I explained to those who went through there, and told them to be careful not to believe it. I will look up my correspondence with Gen. Persning, which was rather considerable, and see whether I have not written to him on that subject.

"The CHAIRMAN. If you have any letters bearing on it, I suggest that you give them to the committee, and we will put them in the record.

"Admiral SIMS. I will look and see. The relations between Gen. Pershing and myself were as cordial as you could possibly imagine them to be between two men. We stopped barely short of exchanging photographs and that sort of thing.

"Senator PITTMAN. You remember the visit of Mr. Byrnes, do you?

"Admiral SIMS. No; I do not at all.

"Senator PITTMAN. I am surprised at that. I thought you stated a while ago that you told Mr. Byrnes what he said you told him, but in addition to that you told him not to believe it. Now, as I understand, you do not remember the visit of Mr. Byrnes?

"Admiral SIMS. I can not identify Mr. Byrnes and those other two, because every little while would come a number of Congressmen or newspaper representatives, etc. I do not believe I would recognize Mr. Byrnes if I saw him again.

"Senator PITTMAN. Do you remember meeting Mr. Carter Glass over there, who was Secretary of the Treasury?

"Admiral SIMS. I did remember it after I got back here and saw him.

"Senator PITTMAN. You remember meeting him?

"Admiral SIMS. Faintly; yes; when he came through there. When I came back I was associated with him on a trip out in the West, and I remembered it then. I might remember Mr. Byrnes if I saw him now, but I do not remember the occasion of his visit any more than I do the occasion of a dozen similar other visits.

"Senator PITTMAN. Then you do not remember what conversation you had with Mr. Byrnes, Mr. Glass, and Mr. Whaley?

"Admiral SIMS. Not particularly; no; but I do know I told everybody I could get my hands on, warned them not to believe these things, and I could not have said the other thing, because I never had any such idea in my life; that the armistice had to be had because they failed there.

"Senator PITTMAN. You know Mr. Carter Glass very well, do you not?

Digitized by Google

"Admiral SIMS. I know him from having met him on this tour for the Liberty loan, that is all. I never saw him before unless I saw him when he came through there.

"Senator PITTMAN. And you feel that you might meet these gentlemen in Paris and then have a subsequent conversation with them again in London later on and not remember it?

"Admiral SIMS. No; it was not in Paris. I never was in Paris but once after that, and I did not meet any of them there. I went there once, in October and November, 1918.

"Senator PITTMAN. He states that he met you in October in Paris.

"Admiral SIMS. I was there just once, just before the armistice.

"Senator PITTMAN. Then they state that they called on you again just before their departure from England.

"Admiral SIMS. Yes.

"Senator PITTMAN. And again discussed this same matter?

"Admiral SIMS. Yes. There were a great many hundred people came through the office on similar missions. The way we came in contact with them was because in a sense my headquarters took charge of all the distinguished Americans who came through. That is to say, we were notified that they were coming, and an officer went aboard the steamer when they arrived and told them that all they had to do was to do as they were told, and that they would be perfectly well taken care of; that their reservations were made on the trains, and reservations were made in the hotels, and that an officer would meet them at the station, and they would be furnished with automobiles, and so forth. Naturally all these men came through the headquarters, and I saw them usually coming, and usually if they went back that way, because we facilitated their travel. If they said they wanted to go to Paris, all they had to do was to tell us about it, when they wanted to go, and everything would be taken care of for them, and they had nothing to do but go.

"Senator PITTMAN. Now, I understand from you that if you did have these conversations which Mr. Byrnes has recited you did not criticize the service that was supposed to supply Pershing's forces?

"Admiral SIMS. By no means. I told them what the criticisms were. I wish it would be proper for me to tell you the ways in which that information would come to me, but it would not just now. I was immensely impressed by the way in which the information came to me, and of its danger, and that is the reason I told these people to look out for it; that this was what was being said.

"The CHAIRMAN. Did you ever talk over with Gen. Pershing the general question of cautioning Americans who came over to the front about not making too much boastful talk about what America was doing?

"Admiral SIMS. No; I never saw Gen. Pershing much over there. I never was at the front at all, because I forbade all my officers to go to the front. I saw him when he came through there the first time. I saw him once when he came up to London for a conference. I saw him once or twice down in Paris, but I never was at the front and I never had any extended conversation with him, although we had considerable correspondence about various affairs.

"Senator PITTMAN. As I understand it, then, if Congressman Byrnes and Congressman Whaley and Mr. Carter Glass got this impression from you, or rather if they have this impression in their minds, you can only account for it by the fact that they must have gotten it mixed up with the impression they got from somebody else?

"Admiral SIMS. I do not know how they account for it, but I never held those opinions at all. I never held the absurd opinion that the armistice had to be accepted because of the condition on the western front. I never thought that for a minute."

Mr. Byrnes, in the light of the statement made by Admiral Sims, which I have just read, do you still contend that your statement made in your speech, which has just been read to you, is correct?

Representative BYRNES. I regret that Mr. Glass and Mr. Whaley and myself did not make more of an impression upon the admiral when we called upon him, that he could not remember us; though he did say, as I remember, at first, that he remembered very distinctly warning us to not repeat what he told us. But my recollection is very clear upon it. The admiral made a more lasting impression upon me, and I am satisfied also upon my two colleagues. I can recall with distinctness that we called upon him at his hotel between 9 and 10 in the morning, and while my recollection would not be clear upon this, I am almost certain it was as the result of a telephone message received by Mr. Glass from him. At any rate, we did call. I remember distinctly meeting a very prominent Frenchman, who at one time served in Washington, as we ascended the stairs to his room.

Admiral Sims very courteously asked us to his apartment, and there made to Mr. Glass, to Mr. Whaley, and to me the statement which I made in my speech, and

Digitized by Google

which you have read and put into this record. That he told us, as he now says that he thinks he did, that this was propaganda, and that "I want you to contradict it wherever you hear it" might be possible if it was only one man who received such an impression as we did from his statement, but when three men hear a statement and leave the room with the feeling of depression and of humiliation that we did, it is——

Senator POINDEXTER. Mr. Chairman, just a second.

Representative BYRNES. Yes.

Senator POINDEXTER. I understood that these gentelmen were called here as witnesses.

Representative BYRNES. Yes.

Senator POINDEXTER. To testify to what occurred.

Representative BYRNES. Yes.

Senator POINDEXTER. Mr. Byrnes is now making an argument as to the matter.

Senator PITTMAN. Of course, if we are going to insist upon those technicalities, Mr. Chairman——

The CHAIRMAN. I think Mr. Byrnes would better testify as to his own impressions.

Representative BYRNES. Mr. Chairman, as a lawyer, I submit that I can testify as to the reasons why I am emphatic in my recollection.

Senator PITTMAN. That is it.

Representative BYRNES. And only for that reason do I make that statement. I submit to you as an attorney that when we——

Senator TRAMMELL. I submit that this morning Admiral Sims, in giving his reasons as to why he did not say that, went into a rather argumentative statement. He said that he did not say it because he did not entertain such views as that, and that he did not think that way. Now, I am sure that the witness at present is just explaining why he could not have gotten the other impression of the remarks of Admiral Sims.

Representative BYRNES. And I will promise the chairman and my friend, Senator Poindexter, that I am not going any further.

The CHAIRMAN. We want the facts.

Senator POINDEXTER. The only reason I object is because it opens up a whole range of facts.

Representative BYRNES. I will promise the Senator that I am not going to speak at length.

Senator POINDEXTER. Yes.

Representative BYRNES. I state that the reason that I am emphatic as to my recollection is that when we left the hotel and the three of us were going back to our own hotel, we immediately discussed the grave consequences of the situation that we felt would arise as the result of the information given to us by Admiral Sims, and with great inconvenience to ourselves we then determined to visit the headquarters of the S. O. S. in order to ascertain from Gen. Harbord and Gen. Hagood the details of this disaster to the American Army.

Mr. Glass had an engagement which precluded his accompanying us, but he agreed that we should go. We were satisfied by reason of the statement made by Admiral Sims that this matter would become known in America in a short time and become a national scandal, and in order that we might know the facts, we decided within 5 minutes or 10 minutes after leaving his apartment that we would go to Tours, and the next day we did go.

I will qualify that statement to this extent, that whether it was the next day or the second day succeeding, I am in doubt; but certainly my recollection is that it was the very next day. Mr. Whaley and myself drove 150 miles to Tours; we visited Gen. Harbord and Gen. Hagood, and we then told those gentlemen what Admiral Sims had told us in Paris.

The admiral says, according to his recollection now, as I understand it, that he was advising us of this in London so that if we went to the Continent we would not be misled. Well, the statement he made to us was not in London. It was in Paris, at the Hotel Crillon, October 31, 1918; and immediately after that we went to Tours, and we did not come back from London to go there. And, as the admiral forgets the date, I emphasize the fact that it was that date.

Now, my reason for that date, if I had any doubt about my recollection, my reason for being in Paris, would be that when we went to Tours we learned from Gen. Harbord and Gen. Hagood that the statements made by Admiral Sims were not true. It was all the more impressed upon our minds, and Gen. Harbord and Gen. Hagood produced letters from Gen. Pershing congratulating them upon the service rendered, after the St. Mihiel drive, a few days later, just preceding our visit there, and another letter from Gen. Pershing again thanking the S. O. S. for their splendid service.

Digitized by Google

I can well remember that we did not return until about 11.30 in the evening, and our colleague, Mr. Glass, was so interested in awaiting our report, that he was up, near midnight, waiting to learn the facts about this terrible disaster about which we had been informed, and we told him then the story.

Unfortunately, I had not a diary. I did not know that I was going to be asked to come before this committee until an hour or so ago. I looked for a very incomplete diary—I never kept one in my life before, and only kept this in order to supplement the diary that my friend, Mr. Glass, was keeping on the trip. I found, however, this diary [indicating], which is very incomplete and which has not any record of the conversation we had with Admiral Sims. It starts only with the memoranda I have of our trip to the S. O. S. I was so impressed with the achievement of the S. O. S. that I wrote down my impressions of that trip, and I find in my shorthand notes the very statement that was made to us by Gen. Harbord and Gen. Hagood and exactly what I had put in my speech, which is now in the record, and the date, because this was the first time that we went down to Tours. I can add nothing else to my emphatic statement that my visit to Tours was not for the purpose of ascertaining the truth about a propaganda of which we had been warned in London or any other place.

Senator PITTMAN. And the statement of Admiral Sims to the effect that he warned you that such a thing was not true and not to be believed, is not correct?

Representative BYRNES. Absolutely not correct. The fact is I was amazed to think the admiral would say that. I thought of several things he might have said about it, but I did not think he would say that. And I might say, if emphasis be necessary as to the statement as to the merchant marine, that that conversation as stated in my speech was not in Paris but was in London, where the admiral very courteously invited us into his office when we met him at the naval headquarters, and in the course of the conversation he made to me the exact statement that I have made in this speech. I took issue with him because I have very strong views upon that question. I did not go into very great detail, but I remember distinctly telling him in that conversation that while in years past the argument in favor of the merchant marine had come from the manufacturers of this country, that by reason of this war there had been a change of mind on the part of the farmers of this country; that the farmers of the South found in 1914 that they could not ship their cotton to Europe because of the uncertain movement of ships, and that the wheat grower in the West found out that subsidies were necessary to establish a merchant marine; and that to-day the farmer was an enthusiastic advocate because he had learned the value and the necessity of ships. I remember distinctly of going into an argument on the question. I was interested in it and have no doubt about it. And if he does not recollect seeing us at all, and I do recollect seeing him and what he said, my recollection is more apt to be correct.

With reference to the statement the admiral made I again wish to challenge it when he says the Navy did not transport but a certain per cent of our troops. I submit that the statements made in my speech come from the official records of the department, and I submit that the statement about the 3 per cent that the admiral again makes is not correct according to the published report, Bulletin No. 5, from Admiral Sims's headquarters, which the committee can obtain, in which bulletin he distinctly gives the figures as to the escort and the number of troops transported. This bulletin will cause Americans to be more proud of the achievements of their Navy than the statements contained in the record there. I refer to the statement in the London Times History of the War, volume 20, page 42, which is substantially the statement which the admiral made to Mr. Glass, Mr. Whaley and myself in Paris, and when again in London as to what our Navy had done. This is the Times History of the World War. It says [reading]:

"While speaking in London on October 11, 1918, Admiral Sims said: 'An idea was sometimes in American minds that the American Navy had been doing the bulk of the business over here; at least a half. That is not correct. There were about 5,000 antisubmarine craft operating day and night, and the American craft numbered 160, or 3 per cent.'"

According to the figures of the Navy Department, that is not correct. The figures according to the Navy Department on that date—he was speaking on October 11, 1918—show that there were 323 United States naval vessels in European waters. On November 11 there were 373 United States naval vessels in European waters, including 70 destroyers, 5 gunboats, 5 Coast Guard cutters, 127 marine chasers, 27 Army yachts, 12 submarines, 13 mine sweepers, and 10 mine planters, making in all 262 vessels engaged in operation against the submarines, instead of 160.

Those were the discrepancies of statement to which I referred and which I took not from any information of mine but from Admiral Sims's statement.

If the committee has any further questions to ask me, I shall be glad to answer.

Digitized by Google

The CHAIRMAN. Mr. Byrnes, after you had this interview there with Admiral Sims, and after you went to Tours, when you found that the admiral was making such statements, what did you do?

Representative BYRNES. What did I do?

The CHAIRMAN. Yes. Did you make any report to the Navy Department or to the Government in any way?

Representative BYRNES. Well, I did not to the Navy Department. Of course, when we returned, though, I was so amazed at it that I did make a report.

The CHAIRMAN. To whom did you make a report?

Representative BYRNES. I made a report to the President of the United States, in the course of a conversation with the President. Because of the impression made upon me by Admiral Sims, I believed it my duty to advise the President, and did advise the President, of the substance of my conversations with Admiral Sims, as I have advised the committee.

The CHAIRMAN. How did you advise the President? By a written report?

Representative BYRNES. No; I stated that in the course of the conversation with the President I told him about it.

The CHAIRMAN. When was that?

Representative BYRNES. I can not give you the date, but I can tell you when it was. It was the Saturday afternoon before Congress met in the fall of 1918. The Congress meets on the first Monday in December, so it was the Saturday night previous. I returned on Thanksgiving Day, that was Thursday, or the day before Thanksgiving. Then a week after my return and prior to the President's departure to Europe I informed him of it.

The CHAIRMAN. Did you talk with the Secretary of the Navy about it?

Representative BYRNES. No, sir; I did not. The only other person I mentioned it to was Mr. Tumulty. I met Mr. Tumulty at the White House while waiting to see the President. I remember telling him, and I remember very distinctly that Mr. Tumulty said, "Why do you not tell Daniels about it, if you feel that it is so important?" And I told him I did not want to, that hostilities were over. But I knew that the President was going abroad and I believed that the President should know it because the President would have to have naval advisors, and I believed that if Admiral Sims advised him as he had advised us, he would be so incorrectly advised that in fairness to him he ought to know what had been said to us, and then he could determine for himself how reliable would be the information he received from Admiral Sims.

The CHAIRMAN. Then, afterwards, when Secretary Daniels recommended Admiral Sims to the position of admiral of the Navy, the President was fairly cognizant of these events that you spoke of, and the attitude of Admiral Sims during the war, and yet did not interfere in any way.

Representative BYRNES. You are asking me to make an argument but you objected to my making an argument in the beginning——

The CHAIRMAN. And then I allowed you to go on.

Representative BYRNES. If you are asking me about the President, I know nothing about the President's views on this subject, why he didn't. I am not authorized to speak for him. I know of no reason why he should have recommended Admiral Sims. I have no doubt that if you ask him, he would advise you.

The CHAIRMAN. Mr. Byrnes, what was this trip that you made abroad? Was it an official trip?

Representative BYRNES. It was not.

The CHAIRMAN. You three Congressmen—Senator Glass was a Congressman at that time, I believe.

Representative BYRNES. He was.

The CHAIRMAN. You made this trip on your own initiative?

Representative BYRNES. Yes.

The CHAIRMAN. And went to the front, and went around over the war zone in Europe?

Representative BYRNES. Yes.

The CHAIRMAN. Not officially in any way?

Representative BYRNES. Not officially, except as a Congressman to secure information about conditions abroad, but not by direction of the House of Representatives.

The CHAIRMAN. But not by direction of the House of Representatives?

Representative BYRNES. I say not by direction of the House of Representatives or by any committee.

The CHAIRMAN. You had nothing to do with the Naval Affairs Committee that went over?

Representative BYRNES. No. I am a member of the Appropriations Committee, not the Naval Committee. Mr. Glass, Mr. Whaley, and myself went not on trans-

Digitized by Google

ports but on the French line at our own expense, and on our own initiative, not in any official capacity.

Senator POINDEXTER. Did you make any protest in the House of Representatives to the Naval Affairs Committee against the conferring of the rank of admiral on Admiral Sims, Mr. Byrnes?

Representative BYRNES. No. I am very glad to answer the question of the Senator. When that bill came up in the House I was sick, absent from the city, and therefore did not vote upon the question at all. In fact, I did not know that it was to be presented, and did not see it for several days afterwards.

Senator POINDEXTER. You did not know that it was pending in the House at the time the vote was taken on it?

Representative BYRNES. No; not until two or three days afterwards, I happened to see it in the newspaper.

Senator POINDEXTER. Do you recall when the armistice was agreed to, what date?

Representative BYRNES. November 11.

Senator POINDEXTER. I understand that your conversation with Admiral Sims was October 31?

Representative BYRNES. Yes; October 31.

Senator POINDEXTER. You say in that conversation he was explaining why it was necessary to agree to an armistice?

Representative BYRNES. Yes; he said that.

Senator POINDEXTER. The armistice was agreed to, or at least the terms were signed on the 11th of November?

Representative BYRNES. Yes.

Senator POINDEXTER. Some time after your conversation?

Representative BYRNES. Yes, sir; 11 days. At the time we saw Admiral Sims in Paris, Jellicoe and others from England were at our hotel, and a representative of the Italian Government had come, Col. House had arrived on this date—that is how I remember the date—too from this country, and they were there for the purpose of preparing the terms of the armistice. According to the most general information in Paris, they were meeting for that purpose at that time on October 31. That is what we learned from them.

Senator POINDEXTER. That is all.

Senator TRAMMELL. Do you know, Mr. Byrnes, whether Congressman Whaley is coming this afternoon?

Representative BYRNES. May I say that Mr. Whaley advised me that he has been sick in bed for three weeks and came out yesterday for the first time, and he telephoned me before I left the house and said that he would be unable to be here, but that he was writing a letter which he asked me to present to the committee.

The CHAIRMAN. I hope you will read the letter.

Representative BYRNES (reading):

"FEBRUARY 10, 1920.

"Hon. FREDERICK HALE,
"*Chairman Subcommittee on Naval Affairs,*
"*United States Senate.*

"MY DEAR SENATOR: I am informed that your committee at its hearing this morning decided to have Senator Glass and Representatives Byrnes and myself to attend a hearing this afternoon to make statements as to the conversation we had with Admiral Sims in Paris and London in October and November, 1918.

"I have been confined to my room for almost three weeks with influenza and my physician advises me that it would be dangerous for me to comply with the request of the committee and attend this hearing. It is my hope that within a few days I will have sufficiently recovered to enable me to appear before the subcommittee, and I shall then not only be willing but shall greatly desire the opportunity to appear. If the committee, however, desires to close this part of its hearing at this time and determines not to await my presence, I ask that there be inserted in the record this letter containing my recollection of the conversations above referred to.

"My recollection is very clear about them. In October, either the 30th or the 31st, 1918, Mr. Glass, Mr. Byrnes, and I called upon Admiral Sims at the Hotel Crillon, in Paris, in response to an invitation extended to us over the telephone by him. During our conversation with the admiral the question came up about the making of an armistice. He was asked why it was necessary and his reply was that the American transportation had broken down; that ammunition and supplies could not be gotten up to Gen. Pershing; and that the Americans could not advance any farther.

"This astounded us all, as we had been down to Tours some weeks before and had been informed by Gen. Harbord and Gen. Hagood, his chief of staff, of the splendid work of the S. O. S. There was no intimation by Admiral Sims that this was propa-

Digitized by Google

ganda by anybody, but was a direct, concise statement of fact by the admiral and was made to us for the purpose of giving us the inside information as to why the armistice was being made.

"After we left the admiral at the hotel we were so disturbed at his statement and so worried because of the fact we felt the American Army was being unloaded on, Mr. Byrnes and myself decided to make another trip to Tours. Mr. Glass could not go with us because he had an engagement the following day, but urged us to go and carefully look into the matter, as all three of us felt it was one which would come up later on and be a source of a great deal of political discussion, national and international.

"During the afternoon Mr. Byrnes and myself got in communication with the Intelligence Bureau of the American Army, in Paris, and endeavored to make arrangements to go to Tours the next day. About 6.30 in the afternoon we received a telephone message stating that arrangements had been made whereby Mr. Byrnes and myself could be sent down in an open machine. We left the following day for Tours and arrived there about 2 o'clock, and we spent that afternoon and evening and part of the following day with Gen. Harbord and his staff, and informed them of this statement of Admiral Sims. The general advised us it was absolutely untrue, and showed us communications from Gen. Pershing containing the highest praise for the work of the S. O. S. Gen. Harbord told me, with some heat, this was nothing but British propaganda, and that there was but one man in Paris yelling for an armistice. Our investigation at Tours satisfied us that the staetment made by Admiral Sims to us was absolutely untrue.

"While in London we visited Admiral Sims again at his office in the American Admiralty Building. During this interview he made the statement that America should not go into the merchant marine business and should get rid of its merchant ships and allow England to control the merchant marine. I did not take part in this conversation to any extent except to listen with astonishment to his statements. Mr. Byrnes, however, did ask him many questions on this line and my recollection is clear that he was very emphatic in his opinion that America should not go into the merchant marine business on any large scale.

"I am told that Admiral Sims has made the statement when he told us about the breakdown of our line of communication back of the American Army, that, at the same time he advised us this was propaganda that was being circulated and he wanted to warn us it was incorrect. I desire emphatically to say that this is absolutely untrue. Had Admiral Sims told us any such story it would never have been misunderstood by all three of us, nor would we have, at great inconvenience, traveled 150 miles in order to ascertain the details of this alleged disaster. Had Admiral Sims told us it was propaganda we would never have reported it to Col. Harbord and Gen. Hagood, and I am absolutely clear in my memory of the conversation with Admiral Sims that it was a direct statement and charge against the American Army and his explanation now of the matter is simply an afterthought in order to avoid his statement which reflected disastrously on the American Army in France.

"I have stated my recollection of the matter succinctly and shortly, but I would like to again express to you my desire to appear before the subcommittee so that any member may have the opportunity of cross-examining me.

"Sincerely, yours,

"RICHARD S. WHALEY."

NOTE.—When the bill making Admiral Sims and Benson permanent admirals in the Navy was voted upon in the House of Representatives, Representative Whaley is reported as having voted in favor of the bill.

The CHAIRMAN. Senator Glass, will you proceed?

STATEMENT OF HON. CARTER GLASS, MEMBER OF THE UNITED STATES SENATE.

Senator TRAMMEL. Senator Glass, you heard the statement read that was made by Admiral Sims this morning, in regard to the question of the visit made by yourself, Congressman Byrnes, and Congressman Whaley, and you observed that statements that were made that if he had told you anyting in regard to this report that he had done it in the nature of a warning, and that he had advised you that it was not true. Will you just tell us your recollection of that, Senator?

Senator GLASS. I want to say in the first place, Mr. Chairman, that I am neither a willing nor a cheerful witness. It is rather distasteful to me to be drawn into a controversy of this sort, because I entertain a very warm affection for my former colleague, Mr. Byrnes, and I have entertained a great admiration for Admiral Sims, and as much attachment for him as one might form for a man whom he has encountered in pleasant work.

Digitized by Google

It is quite obvious to me that Admiral Sims has somewhat confounded some conversation held by him with some persons in London with his conversation held with Representatives Byrnes, and Whaley and me in Paris. As I find from my diary, on Monday, the 28th of October, Capt. Jackson, United States naval attaché in Paris, arranged for me to see Admiral Sims at the Hotel Crillon, and on October 30 we did see Admiral Sims.

Senator POINDEXTER. What date?

Senator GLASS. October 30. The notation here is "Admiral Sims at Hotel Crillon," so I take it that was the date upon which we saw him.

I had a letter of——

Senator POINDEXTER. Let me ask you there—not to interrupt you—you heard Mr. Byrnes's statement that it was the 31st?

Senator GLASS. Yes. I am giving my statement now, not Mr. Byrnes's.

Senator POINDEXTER. Mr. Byrnes is evidently mistaken about it.

Senator GLASS. Either Mr. Byrnes is or I am. [Laughter.]

Senator POINDEXTER. Which do you think it is? Do you think it is you or Mr. Byrnes that is mistaken? I am trying to get information. It could not have been both dates. You see, one or the other is mistaken.

Senator GLASS. It could have been both dates, because we might have seen him two times.

Representative BYRNES. If you will pardon me, I think in justice to me the Senator will remember that I have stated that I fixed the date by this diary, which showed that we were at Tours on the 1st, and that it was my recollection that it was the day previous. It might have been the day before that.

Senator GLASS. Certainly that is not material.

Representative BYRNES. I fixed it only by the date we went to Tours. I have a memorandum here from which I concluded that it was next day.

Senator POINDEXTER. I think you did say that.

Senator GLASS. I think it is totally immaterial whether it was the 30th or 31st.

Senator POINDEXTER. It is material or immaterial as showing the liability of a man to forget things.

Senator GLASS. Yes; anybody on earth is liable fo forget things, particularly as to whether a thing happened on the 30th of the month or the 31st of the month a year ago.

Senator POINDEXTER. I think that is true, and I just call attention to it to emphasize it.

Senator GLASS. At all events, Mr. Chairman, we did go to the Hotel Crillon, in Paris, and I sent up to the apartment of Admiral Sims a very cordial letter of introduction from the Secretary of the Navy, and Admiral Sims promptly came down into the lobby of the hotel and sought me out. I presented to him my two colleagues, and he invited us up to his apartment.

My recollection of the incident is a little different from that of my former colleague, Mr. Byrnes. As I recall, what Admiral Sims said was prompted or provoked by a statement that I made to him that we had been at general headquarrers a few days theretofore, at Chaumont, and had gotten the distinct impression that Gen. Pershing was opposed to an armistice, whereupon Admiral Sims responded, as I recollect, that we were obliged to grant the armistice because of the breakdown of the communications of supply. I was not impressed with the idea that Admiral Sims was in a critical state of mind but was simply stating his view of the situation. I can not say that I got the impression that he was undertaking to discredit the Army, but was merely stating what he supposed to be a fact.

I am quite clear that Admiral Sims did not say to us that he did not believe the statement, and that he did not caution us not to believe the statement, because that was the first intimation that any of us had received on the subject, and it came literally as an unqualified statement. It is incredible—and this may be argumentative and improper—it is incredible that two sane men—and all Congressmen are not sane—should have put themselves to the great inconvenience and indeed physical distress, in the state of the weather over there, to have gotten into an automobile and to have traveled, as Mr. Byrnes says, 150 miles, from Paris to Tours, to undertake to verify or disprove a statement, when they had been in advance told that the statement was not true and not to believe it. As a matter of fact, Mr. Byrnes and Mr. Whaley did, according to my diary, on October 31, go from Paris to Tours. My notation here is, "Thursday, October 31. Whaley and Byrnes went to Tours to see S. O. S." I did not go; and Byrnes will pardon the frank statement that I did not go because I wanted to get rid of him and Whaley the next day. I wanted one day in Paris to myself. [Laughter.] I wanted to see things that they did not want to see, and I saw them in their absence. I find that they were perfectly harmless things, though.

Digitized by Google

I went to see Lord Derby, the British ambassador, and I went to the Church of Notre Dame, and I observe here that I "prayed in Notre Dame." At all events they did go. I, in a spirit of levity, teased them about having their South Carolina general, Hagood, involved in that sort of trouble. I had no Virginia general there to look after and I did not go—another reason.

At all events, they were rather indignant over the statement made by Admiral Sims. I was not especially indignant. I was a little regretful at the statement that there had been a breakdown of communications of supply, and that because of that we must grant an armistice.

I am not clear in my recollection that it was at that interview and in that conversation that Admiral Sims spoke of the merchant marine, and spoke specifically and in detail of the work, in contrast, done by the British and American naval forces. It may have been there, also; but undoubtedly, in London, Admiral Sims did make statements to us substantively as Mr. Byrnes has said, though I did not enter into the conversation to any great extent, except I recall, in response to the suggestion of Admiral Sims that we would never have a merchant marine because of the policy of subsidy necessarily involved, having answered that I thought the American people, subsidy or no subsidy, would decline ever to be caught in the humiliating situation at which we found ourselves at the beginning of this war.

While I have no sort of doubt in my mind that Admiral Sims made substantially these statements, I can not say that they made exactly the same impression on me that they made upon my colleagues. I had been, myself, regarded as decidedly proally and even, before the war began, by some of my friends had been regarded as decidedly pro-British. I recall very distinctly laughing at my colleagues and telling them that Admiral Sims beat me at it, all to pieces. And I did feel some sense of humiliation that apparently our Navy had not done a great deal.

There is not a particle of doubt in mind, however, that these statements were made by Admiral Sims, because—not "because." There is no doubt.

But then I called on perhaps two of the most prominent statesmen of Great Britain while in London with letters of introduction, and it happened that both of these gentlemen in a more or less mysterious way referred to this breakdown of the American communications of supply, and I remarked to my two colleagues that there must be some truth in what Admiral Sims had told us in Paris, because these two prominent British statesmen, in converstation with me, had mentioned the same incident. And later on in the month, when we went to the British front, Maj. Norie, of the British service, at the chateau at which we were stopping, made reference to the same thing. And again I twitted my South Carolina colleagues with the fact that their South Carolina general had broken down and that there must be some truth in what Admiral Sims had told us in Paris.

The CHAIRMAN. When was this, Senator? Was it before the armistice?

Senator GLASS. Oh, yes; this was all before the armistice.

I am not surprised that Admiral Sims has no recollection of receiving Whaley and Byrnes and me. He was a great man over there, and we were ordinary American Congressmen, a great many of whom went over and went to headquarters.

I am neither surprised nor indignant at his failure to remember me. I remember him very cordially, because he gave us the rare opportunity of visiting the Grand Fleet, and we were on board a British battleship when the wireless news came of Germany's capitulation, and there by the courtesy of Admiral Sims. I believe that I have, as briefly and as succinctly as I can do, stated my recollection of the matter.

Senator POINDEXTER. Did you make any entry in your diary of the principal conversation with Admiral Sims that you have referred to, on the 30th of October?

Senator GLASS. No; I did not; nor have I repeated the conversation since I have been back over here.

Senator POINDEXTER. I am referring to what you testified to here just now.

Senator GLASS. Well, I did not testify that I made any notation of my conversation.

Senator POINDEXTER. But you testified to a conversation.

Senator GLASS. I did; yes.

Senator POINDEXTER. And you made no note of that in your diary?

Senator GLASS. I said I had not.

Senator POINDEXTER. When were these conversations you had with the two principal statesmen of Great Britain?

Senator GLASS. Why, immediately before or immediately after the armistice. I think it was immediately before the armistice; sometime between the 4th and the 11th of November.

Senator POINDEXTER. Of course, then, that was after Mr. Byrnes and Mr. Whaley had visited Tours and returned and made their report to you?

Digitized by Google

Senator GLASS. Oh, yes. They made no report to me, however. They merely stated conversationally that Gens. Harbord and Hagood explicitly denied that there had been any breakdown of the communications of supply, and had exhibited to them—and indeed they had obtained copies of—recent orders from Gen. Pershing highly commending the efficiency of their sources of supply.

Senator POINDEXTER. Do you remember what they said to you when you twitted them with the fact that it must be true, in view of what these British officers said?

Senator GLASS. Well, I would not like to repeat here in this presence what they said.

Senator POINDEXTER. It is quite interesting to know the substance of it, and you could leave out any offensive part of it and tell what they said.

Senator GLASS. All of it was offensive.

Senator POINDEXTER. I guess that is all.

The CHAIRMAN. That is all.

Senator TRAMMELL. I do not know of any further questions, Mr. Chairman.

Senator PITTMAN. Mr. Chairman, I was not present when Congressman Whaley's letter was read. Does he ask to be heard before the committee?

The CHAIRMAN. He says that he will be very glad to appear, unless we want to close the hearings immediately.

Representative BYRNES. Mr. Whaley says that he is not only willing but most anxious to have an opportunity to come before the committee. His doctor advised him that it would be very unsafe for him to come down town here to-day. He has been sick for three weeks.

Senator TRAMMELL. I think we have covered the principal points involved.

Representative BYRNES. He said that he desired to appear before the committee if they wanted to cross-examine him in reference to it.

The CHAIRMAN. Yes.

Representative BYRNES. He hopes to be out in two or three days.

Senator TRAMMELL. So that, unless the committee decides later to call him, I see no necessity of it.

The CHAIRMAN. That is correct. Admiral Sims, have you anything further to say to the committee?

Senator TRAMMELL. I just want to ask one question.

The report of Gen. Pershing which you read from there, Admiral, does it state that the soldiers were ready and available or not?

Admiral SIMS. I do not think that it says that the soldiers are available; but when he asks to have them sent over by a certain time, of course he would not have asked unless they had been available. They would have been available or that would have been foolish. He must have known the situation thoroughly.

Senator TRAMMELL. I do not think that would have been foolish. I think he knew they were preparing our soldiers, and he was giving them in advance the number they would need by a certain time; and of course it may be, making that request that a certain number be furnished by that time, the War Department would go ahead and try to get that number ready for him.

Admiral SIMS. I think it is altogether probable that the rapidity of the training of the troops was governed by what they knew as to the limitations of the transports to carry them across. I would assume that as being entirely reasonable.

Senator TRAMMELL. As far as you knew, the soldiers were transported and available at the time that he requested them to have a certain quota requested in that communication?

Admiral SIMS. He made a request for a certain number of troops, and he said he made it that size because he knew that they could not get them over. Here is what he says (reading):

Understood here that a shipping program based on tonnage in sight prepared in War College Division in September contemplated that entire first corps with its corps troops and some 32,000 auxiliaries were to have been shipped by end of November, and that an additional program for December, January, and February contemplates

Digitized by Google

that the shipment of the second corps with its corps troops and other auxiliaries should be practically completed by the end of February. Should such a program be carried out as per schedule and should shipments continue at corresponding rate, it would not succeed in placing even three complete corps, with proper proportion of Army troops and auxiliaries, in France by the end of May.

The beginning of that dispatch, which is dated December 20, 1917, says: "Understood here that a shipping program based on tonnage in sight prepared in War College Division," etc.

In other words, they were shipping troops over there conditioned upon the known condition of tonnage, and probably their training was the same way.

Senator TRAMMELL. It remains as a matter of fact that they did transport them, and, according to the report of the Secretary, got approximately 1,000,000 men there by the 30th of June, 1918?

Admiral SIMS. I will give you the figures there, in a minute. They got over there about 880,000 troops by the end of June; that is with the service of supply and auxiliaries, etc., as mentioned in his telegram.

Senator TRAMMELL. By the end of June?

Admiral SIMS. By the end of June. That is the arrival in the ports. These are the Navy's figures of the total at the time they arrived in the ports. They reported back to us. Here is a memorandum submitted to me by the officer who handled convoys, and who was informed directly through his office of the amount of troops that arrived on each transport, etc. [Reading:]

UNITED STATES NAVAL FORCES,
OPERATING IN EUROPEAN WATERS,
U. S. S. "MELVILLE" FLAGSHIP,
July 12, 1918.

Ref. 01.
Memorandum for the Admiral.

At the end of June there had arrived in Europe 878,878 troops. These have been carried as follows:

American ships	463,625
British ships or ships controlled by British	408,657
French line ships carrying a few troops as passengers	4,943
Italian line	1,653
Total	878,878

British moved less than 50 per cent total to date.

During April, 1918, the British began to reorganize their shipping, placing combined troop and cargo vessels on the run between United States and England. The first large convoy arrived in England on May 7. During May an additional 11½-knot troop convoy was started and the first convoy arrived on May 24. The process of reorganization is still going on. During the months of May and June 55 per cent of the troops brought to Europe were in British ships or in ships under British control. During June the percentage of troops in British was about 57 per cent.

The United States is also increasing its fleet of transports by adding Dutch ships and American ships; also a contract has been made with the French to use a number of French transports to carry troops direct to Europe. Thus far French ships have contributed practically nothing to troop transport.

The records for July thus far would indicate that July will be the biggest month to date, and there will be upwards of 250,000 troops carried during this month. It looks as if British ships would carry about 55 per cent of the total for the month of July.

That is just a periodical report that was sent in by the man handling the troop transports. He got all the figures as they came through.

Senator PITTMAN. When was the great troop shipment from the United States?

Digitized by Google

Admiral SIMS. It began after the drive in March. It began in April. Just running down through the figures, without taking all the details of the entries, I find: January, 40,000; February, 27,000; March, 72,000; April, 104,000. Now we begin to get the large numbers. May, 233,000; June, 230,000: July, 318,000; August, 258,000; September, 311,000; October, 202,000; November, 97,000. So that it began with May—say, the 1st of May or the latter part of April. In April there were 104,000 and in May 233,000. So that it began the latter part of April. The drive began on the 21st of March, as I remember it.

Senator TRAMMELL. Was there more allied shipping in May, 1918, than there was in October, 1917?

Admiral SIMS. Was there more allied shipping when?

Senator PITTMAN. In April, 1918?

Admiral SIMS. Than there was in November, 1917?

Senator PITTMAN. In November, 1917?

Admiral SIMS. No; it was still going down. No, it did not begin to increase. the shipping, up until what was the month?

Senator PITTMAN. And yet in April, when you had less allied tonnage——

Admiral SIMS. What month?

Senator PITTMAN. April, 1918, when you had less allied tonnage than in November, 1917——

Admiral SIMS. Yes.

Senator PITTMAN. You transported 247,000 troops?

Admiral SIMS. Yes.

Senator PITTMAN. Two hundred and forty-seven thousand seven hundred and fourteen troops?

Admiral SIMS. Yes.

Senator PITTMAN. While in November, 1917, you transported 23,722 only.

Admiral SIMS. Yes.

Senator PITTMAN. In other words, when you had less allied tonnage, there were transported over ten times as many troops, in that month?

Admiral SIMS. Yes. I think you were out of the room when I explained why they were able to do that. I think you had left, and Senator Trammell was talking to me about it. The reason we were able to do that was this: When we were in this point of the curve—and this is very important—where these things were diverging from each other, the future looked very black, as Mr. Hoover explained. We did not see how we could escape defeat. When we put the convoy system into operation the losses of shipping began to go down, and building of shipping began to go up. Just as soon as we got up about here and here [indicating on chart], knowing that we were approaching the point where they would cross, we knew then that the submarine campaign could not win for Germany, and then we were able to bring in ships from the outside that were en route, that we would not have dared to bring in before. That is the point I want to make very clear. As long as these lines were diverging from each other, and the loss of shipping was very much greater than the building, we did not dare haul those ships in from all over the world, and concentrate the shipping all in one line. When it began to come down this way [indicating on chart], we knew

Digitized by Google

that in a measurable time these two lines would cross each other, and buildings would be superior to losses; but until we could see these lines converging—and we kept this curve for that purpose; and I predicted that they would cross there, and I predicted within a week or something like that of the exact time—we did not dare bring in those ships. This was all done in sight of the members of the allied council. They said where they were going to get this tonnage for us; and it was not that they had less tonnage to use for the troops, but it was that they could use tonnage that they did not dare use before.

Senator PITTMAN. I am not interested in the reason. I just say that it is a fact that it was within your power that with the tonnage you had you did transport 247,000 tons in April, 1918, when you only transported 23,000 with a greater tonnage in November, 1917.

Admiral SIMS. Certainly it was within our power, but it was not within the limits of ordinary, mere common sense to have done it before we saw these curves converging.

Senator PITTMAN. I am saying it was possible.

Admiral SIMS. The possibility has not anything to do with it at all. It was made as a combined military decision of all the military men over there in the supreme war council, with all the naval men and the shipping men with the fate of the country in their hands, and therefore it was not possible to do it at all as long as human beings remained the same as they are.

Senator PITTMAN. In other words, there were British ships on some other long runs that could have been used?

Admiral SIMS. No; the ships were British, French, Italian, Portuguese, and all sorts of ships. They were bringing supplies along the coast of South America into the United States; many of those supplies absolutely essential, many of them articles that the war could not go on without. But as soon as we saw that we had the submarine campaign a failure, then we could bring those ships in. You could not say that it was possible before. Of course, it is possible to do any fool thing in the world, but no reasonable man sitting around a council table could have done it before that.

Senator PITTMAN. No; but if there had been a million troops in the United States in 1917, which there were not, and their immediate presence in France was essential to win the war, they would have been gotten there?

Admiral SIMS. They could not have been gotten there at that time until we saw our way clear, because there would have been no way to keep them there. We would have had an Army there all dressed up and no place to go. We did not dare to put too many troops there.

Senator PITTMAN. I see. Then Gen. Pershing was not in such a hurry to get them there after all?

Admiral SIMS. According to what he says, he was.

Senator PITTMAN. But you say that you would have had them there all dressed up and no place to go.

Admiral SIMS. The thing has to be carefully worked out as to what you are going to do. You have got to have the tonnage. Our embarrassment was due to the fact that there were 2,500,000 tons lost clearly by our not going into the war in the beginning. Now, the effect of that thing is a matter of military opinion, and there is

Digitized by Google

no doubt in the world that about 2,500,000 tons were lost unnecessarily to the allied cause by our not going into the war until later.

Senator PITTMAN. You mean not declaring war sooner?

Admiral SIMS. No; I mean not putting forth our early effort, as we could have done in April, 1918, and resisting the convoy system. That is what hurt us, not sending the antisubmarine forces over to the other side, which would help convoy, because we convoyed 40 ships with only five or six destroyers. That was a scandal. And our ships were bumming up and down our coast here, and they would not send them over. They would not give them cruisers to transport them across the ocean, to protect them against raiders. That is the whole business about it.

Senator PITTMAN. That is a technical matter?

Admiral SIMS. No, it is not a technical matter. It is just plain, common, ordinary common sense. There was a war going on over there, and they did not send the ships over. It was months before any of them got there.

Senator PITTMAN. Undoubtedly there will be some other admiral come on here and explain every policy here, and I imagine they have got some common sense.

Admiral SIMS. They are going to be up against it.

Senator PITTMAN. All the admirals in the Navy will be up against it.

Admiral SIMS. They surely will if they undertake to explain how they could fight the war on this side. What we are trying to do, Senator Pittman—and you are a good American and you must be with us in this—is this: God help us if this had been a real war. As far as the Navy was concerned, if we had declared war against a single power that was ready on the drop of the hat with a navy, where would we have been? None of our ships, to speak of, were ready. There was no plan made as to what we were going to do with the submarine campaign; and officers of the Navy are horrified over that as soon as they find it out; and we do not want that to happen any more, and that is the reason we are bringing this thing out, to have it discussed.

Senator PITTMAN. The question of having an efficient fleet is a matter, of course, that appeals to every naval officer, and I think it appeals to every member of the Naval Committee.

Admiral SIMS. Yes; it is the first line of defense.

Senator PITTMAN. And it has, for a long time; but there are many in Congress to whom it does not appeal very strongly. There never is an appropriation bill prepared by the department and presented but what it is cut all to pieces. When the three-year naval program came up, the House cut it all to pieces, and the Senate Naval Affairs Committee doubled it and extended the life of it. But that is a matter of policy, of course, that is established by representatives of the various sections of the country.

Admiral SIMS. Yes; I understand that.

Senator PITTMAN. You can not build ships or repair ships nor get personnel for ships without money. That policy we are not going into.

Admiral SIMS. No. What I am speaking about is that they did not use the ships they had.

Senator PITTMAN. Yes; and I am confining my objection to your line of testimony on that. The only thing I am questioning you in

Digitized by Google

regard to is what I consider hasty statements on your part with regard to the responsibility of the Navy; and I have not any doubt that you consider that the plans adopted by the board here with regard to the protection of this coast were absurd, and yet some of those are very able officers, who felt that the first consideration of the Navy was the protection of the ports of the United States.

Admiral SIMS. You can not protect the ports when they are not attacked.

Senator PITTMAN. Yes; I understand that; but they thought they might have been attacked.

Admiral SIMS. Very well; but I told them, and it turned out to be absolutely true. I said "There will never be a submarine leave the other side without my telling you her name and number and when she leaves, and what she is going to do. Listen to this: A submarine that came over here from the other side to attack our ships would have no base here. He has got to come over at a speed of 4 or 5 knots an hour, and it takes him nearly a month; and our submarines, as I said, could be sent back at double the speed, because they come right back and go into port and refuel; and the destroyers could be sent back. If you can imagine the situation, with a war going on 3,000 miles away, and they holding back the forces here for fear some of these fellows will slip through and come over here and attack the coast. If they had attacked the coast in any force at all they must have lost the war. It is like this: There are the ports of the submarines, separated from us by 3,000 miles. Everything that leaves out of those ports and comes across the ocean has got to go back in that hole there. What is the sense in coming way over here looking for them, when they are bound to come right back there to go back in their hole. Everything rendered it certain that the war would be lost to the Germans if they sent their submarines over here.

Moreover, they could not have sent them without my knowing it and telling them over here. I told them every time a submarine left when she left and where she would go and where she would lay her mines, and I told them all about it every time. If they were not disposed that that information was all right, for the Lord's sake, why did they not send somebody else over there that they would believe about it?

Senator PITTMAN. I do not know whether you are right or wrong about it, as a naval officer.

Admiral SIMS. I do. I know.

Senator PITTMAN. I know you are indiscreet about some statements you have made, that you have had to take back, so far, during the hearings here.

Admiral SIMS. Yes. Let me tell you one thing. I would like to make quite clear that in all the propositions that were made on the other side for the putting down of the submarine campaign, all of those things without exception, the ones that are worth talking about, were resisted by the Navy Department during a period of three or four months, and were then finally accepted and adopted. Therefore they must have been right in the opinion of the Navy Department. Every device that was put up by the Navy Department on this side, of any particular importance, was rejected by the Naval Council on the other side as not being practicable, and was finally, after a correspondence of two or three months, acknowledged by the

Digitized by Google

Navy Department here as not being practicable. That is what we are complaining about; the violation of every principle of warfare, that you send a man where the fighting is going on to carry on the fighting, and then try to tell him, from a distance of 3,000 miles, every little thing that he is to do. We can not afford to put up with that sort of thing another time.

Senator PITTMAN. I know one thing, if they had asked your advice and taken it, you would have escaped one unfortunate thing, and that is this hearing.

Admiral SIMS. Let me interrupt, right there, please. It was not a question of my advice in the case. You can go through my testimony, and you can find repeated expressions about "my advice," but it was not my advice. It was the advice of the ablest men in the allied navies, sitting around in a council chamber, men who had had three years of experience in this war, and the whole thing thrashed out with the army people on the other side; and those decisions were sent over here. That is what is called, popularly, my advice. Every one of those decisions was reached after a long discussion of those able men, and was based on the discussion there. You could send to any part of the admiralty in Paris, or wherever it was, and get all the information on anything and lay it on the table and we would sit there for a week, if necessary, and discuss these things, and we would determine on the policy and then I would send it to Washington, and what happened? Nothing doing. They would not even discuss it; and then after two or three months of correspondence, finally they would say "The scheme of the allied council"—not my scheme—"is approved, and we will adopt it."

Senator PITTMAN. Did they ever follow your advice in regard to catching submarines with fish nets?

Admiral SIMS. With fish nets?

Senator PITTMAN. No; with nets?

Admiral SIMS. I do not understand.

Senator PITTMAN. Did they follow your advice about seining these submarines out of the ocean?

Admiral SIMS. They tried every possible scheme. They tried floating nets with glass balls on the top, not to catch the submarine but in order to trace him. During the years we were out of the war certain information drifted over here in various ways. I was asked frequently by church societies and such organizations to tell them what I knew about the submarine campaign. We did not know much about what they were doing on the other side then, although some of the attachés who were over on the other side, and that were serving in Washington, had been on the other side, and they told us what they knew about it, and it was full of misinformation; and in the lectures delivered then there were a good many things told, given to us as actual information, which were not true, or that had been tried and were not successful. Among those were the trailing nets, as they called them. They would suspect the presence of a submarine and they would put out a drift net with glass balls on top, and the idea is that the submarine comes along and puts his nose into the net and he can not get clear of it, and he is dragging along these glass balls on the top, and it shows you where he is. I never recommended anything after I got over on the other side that

Digitized by Google

was not as the result of full conferences, naturally, with those leaders of the allied navies.

Senator PITTMAN. I do not believe that I have time to finish now, although I have not much more.

The CHAIRMAN. I think that we had better adjourn now. It is 1 o'clock.

(Thereupon, at 1 o'clock p. m., the subcommittee took a recess until 2.30 o'clock p. m.)

AFTERNOON SESSION.

The subcommittee reconvened at 2.30 o'clock p. m., Senator Frederick Hale (chairman) presiding.

TESTIMONY OF ADMIRAL WILLIAM S. SIMS—Resumed.

Senator PITTMAN. We will just turn to another question and go on with the matter that I had in mind. The *Vaterland*, with regard to which you wrote on November 2, 1919, was afterwards known as the *Leviathan*?

Admiral SIMS. The *Leviathan*.

Senator PITTMAN. Did you not, Admiral, on the 24th of October, 1917, state as follows:

Consensus of opinion is against using the ship *Leviathan* as a transport. Her length makes her better target than smaller vessels.

And then on October 28, 1917, you reported:

Reasons against using United States ship *Leviathan* already have been submitted.

Do you know when the *Leviathan* was put in service as a transport with troops?

Admiral SIMS. I could not tell you about that; but I can tell you why they recommended that she should not be used, and that was on account of the lack of facilities in places to get her coal. As I remember the figures now, she requred about 8,000 tons of coal. She was built as a passenger steamer and required a great deal of coal; and all that coal was not in France. It had to be taken there.

Senator PITTMAN. The *Leviathan* did carry over 100,000 American troops across to France, did she not?

Admiral SIMS. Yes; when we got the facilities for her, and when we had put down five different big anchors in the harbor so that she could be held there, then she was used as a transport. She was one of those ships that although her anchor was of the very largest size known, it would not hold her at all, even in a moderate breeze. When we got all those things cleared up we used her as a transport to bring troops over. The reason we put that down, not to use her as a transport was, first, bad holding ground; second, lack of port facilities; third, liability to much delay in disembarking and coaling, owing to her exposed position where she had to lie out, at Brest. We had not the necessary lighters and steam lighters, etc. When all those difficulties were overcome, as I say, she was used with great success as a transport.

Senator PITTMAN. You know that in December they began to use her as a transport?

Digitized by Google

Admiral SIMS. I would have to look up the records. I do not know.

Senator PITTMAN. Here is a letter of February 9, 1918, which reads as follows:

I have just had a conference with the Admiralty and the Ministry of Shipping regarding the use of the *Leviathan*, *Olympic*, *Aquitania* and *Mauretania* as troop transports. The following points were discussed.

USE OF LARGE SHIPS.

There was complete accord in the opinion that the use of these ships for carrying troops introduces a considerable element of danger, owing to the large targets that these vessels make. I pointed out, however, that this added danger would have to be accepted in order to carry out the programme of troop transport. The Admiralty officials wished to have it recorded that they considered the increase in danger of using these large vessels was marked, and that we might expect to lose one of these vessels at any time. All agreed, however, that the shipping situation demanded that these vessels be used for troop transports, assuming the necessity for early transfer of a large number of troops from America. Every effort will be made to give these vessels adequate protection.

SUITABLE PORTS FOR LARGE VESSELS.

A representative of the ministry of shipping desired that all of these vessels should use Brest, but it was pointed out that Brest has no facilities for handling these ships, and can not provide the necessary coal. The Admiralty officials were opposed to the use of Southampton on account of the added danger of submarines.

That is, having to go all through the channel.

In this I agree under present conditions. There remain only the ports of Liverpool and Glasgow. Of these Glasgow can not provide docks, and there is difficulty in providing water and coal. Liverpool is the only port that can be satisfactorily used, and even this port has many limitations. Already it is congested. During the past few weeks a greater number of submarines than usual have passed north about instead of through Dover Straits, and have entered the English Channel via the Irish Sea. This has greatly added to the dangers of the use of Liverpool; but at the same time the port is safer than that of Southampton under present conditions, and is the only port that can be used for these large vessels. In an emergency these vessels can be anchored in the Clyde below Glasgow; but troops would have to be transferred by tugs, and tugs would also have to remain in attendance in the event of the vessels dragging.

RÉSUMÉ.

I think it is clear to the department that there is some added risk in using these large vessels, and that there are many limitations to the employment of these vessels. We are restricted to use of British harbors, owing to the lack of suitable harbors in France and lack of coal in France. With the submarine situation as it is at present and as it has been for some time, we are practically restricted to the use of Liverpool, and the congestion and lack of facilities in this port for large vessels restricts us to having not more than two of these large vessels in port at the same time. Liverpool has but two berths that can accommodate these large ships under all conditions.

It will be necessary to arrange westward sailings in advance of the arrival of eastbound transports.

That was the difficulty. When those difficulties were removed, we used her with great facility.

Senator PITTMAN. What was the date of that?

Admiral SIMS. February 9, 1918.

Senator PITTMAN. And your first reported objection to it was in October?

Admiral SIMS. Sir?

Senator PITTMAN. Your first reported objection to the use of the *Leviathan* was in October, 1917?

Digitized by Google

Admiral SIMS. October.

Senator PITTMAN. In which you said that the consensus of opinion was against using the United States ship *Leviathan* as a troop transport, because her length made her a better target than smaller vessels?

Admiral SIMS. Yes.

Senator PITTMAN. Now, Admiral, that is only a memorandum of various letters we have.

Talking about this submarine menace, and about your plan for breaking it up, how soon after the war began—I mean the European war——

Admiral SIMS. How soon after what?

Senator PITTMAN. How soon after Germany and Great Britain were involved in war, did they commence to use the submarine?

Admiral SIMS. Very soon after the war there was torpedoing of certain vessels. The whole of that situation is given in the best possible form, I should say, in Admiral von Tirpitz's book, where he took one attitude as to the use of the submarine, and the prime minister another attitude, and he explains in there the initiation of the submarine attacks, and the limitations, and their suspension, and so on, up to the final decision to start the unrestricted submarine campaign. I could not give you those dates now.

Senator PITTMAN. It commenced in 1914?

Admiral SIMS. Commencing in 1914.

Senator PITTMAN. They did commence, I say, in 1914?

Admiral SIMS. There were torpedoings in 1914.

Senator PITTMAN. Yes.

Admiral SIMS. Shortly after the war began.

Senator PITTMAN. As a naval officer, I suppose you were interested in the study of the problems created by those submarines in naval warfare?

Admiral SIMS. Certainly; yes.

Senator PITTMAN. And you were studying it from the time it commenced to the end of the war?

Admiral SIMS. In ignorance, at first; as to the conditions, the same as all naval officers were. That is a very singular thing. If you will look at that thing in Von Tirpitz's book, and in the articles that I have been recently publishing, you will see that the opinions of practically all the naval officers in the world as to what the submarine could do, and its limitations, were almost grotesquely in error. I wished in one of these articles to make the statement that none of us knew, in the beginning of the war, how much the submarine could do. I did not want to make that statement without backing it up with the necessary evidence, because there were a good many officers in all services who did not know what that evidence was, and in looking it up I found that the principal officers of the British service, dating back many years before the war, had expressed their opinion as to what they thought a submarine would be able to do, and I do not think that any of them, according to these statements, believed that a submarine could operate any considerable length of time away from its base, and consequently they believed that it could not go any considerable distance away from its base.

When the *Audacious* was torpedoed, you will find in the British published account, and also in Admiral von Tirpitz's book, that the

Digitized by Google

British were so sure that that submarine which laid the mine which blew up the *Audacious* could not have been operating from Wilhelmshaven in the Heligoland Bight, but that it must have an outlying base some place; that they searched the west coast of Scotland minutely to see if they could find the base. The expressions of older naval officers before the war were to the effect that submarines would have to have parent ships with them; that the question of habitability alone would prevent them operating any length of time away from their base. So strong was that opinion in the German Navy itself that, although Admiral von Tirpitz, in his building program insisted upon submarines that were seagoing and not merely ones to operate around their own coast, so strong was that opinion that he had to have a very secret experiment carried out to demonstrate to his own people something of what a submarine could do; and according to his statement in his book he sent a number of submarines, I think there were 11 of them, to go 300 miles north in the North Sea and see how long they could remain; and they remained for 11 days, which was a very astonishing thing at that time, and demonstrated that they could do that.

With further improvements as to inhabitability, as you know now, they were able to operate much farther.

It is perfectly safe to say that it was a surprise to practically all naval officers in the world to find that submarines operated two and three hundred and 400 miles west of the west coast of Ireland and west of the west coast of France, and that they remained at sea usually anywhere from two to four weeks, depending upon what luck they had, the limitation being the ammunition that they carried, the ammunition being torpedoes.

Before the unrestricted campaign they used to sink ships by gunfire. They would pop up out of the water close by a ship and she would have to stop and surrender on pain of being torpedoed. They would send a boat to take off what they wanted from the ship, allow the crew to take to the boats, put an inexpensive bomb on board, blow a hole in her bottom, and watch her sink.

When the unrestricted campaign came on and when vessels were, generally speaking, armed, they had to attack without warning from under the water by torpedo, and when their torpedoes were exhausted they had to return. That, generally speaking, is the information they had about submarines at the beginning of the war.

Senator PITTMAN. You mean at the beginning of the German war?

Admiral SIMS. At the beginning of the German war.

Senator PITTMAN. Not our war with Germany?

Admiral SIMS. No, no. By the time of our war with Germany we knew better what they could do. But they did some things after we joined it, also.

Senator PITTMAN. How long was it before it was discovered that submarines were out in the Atlantic?

Admiral SIMS. It was very early in the war when the *Audacious* was torpedoed. They knew then, directly afterwards, that they were operating out there, because she laid a mine that the *Audacious* ran into.

Senator PITTMAN. Very soon after the beginning of the war?

Admiral SIMS. I do not remember just the date.

Digitized by Google

Senator PITTMAN. Now, Admiral, you have criticized the fact that at the time we went into the war, in 1917, we were not sufficiently prepared to meet this submarine destruction. You had been studying the question as a very high expert, and on December 19——

Admiral SIMS. Studying the question with a very grave lack of information as to what the conditions were over there.

Senator PITTMAN. Yes.

Admiral SIMS. We did not send over officers to any great extent to get the information, and we did not know much about it.

Senator PITTMAN. The fact was that there were certain physical things that could be observed, that came to us, with regard to the torpedoing of vessels on the Atlantic, such as the *Audacious*.

Admiral SIMS. Yes.

Senator PITTMAN. On December 19, 1916, about four months before we entered the war—in fact, less—the Naval Affairs Committee of the House of Representatives was dealing with the question of preparing a Navy, I assume to be, when you gave this advice to the committee. I am reading from the hearings before the Committee on Naval Affairs of the House of Representatives on the estimates submitted by the Secretary of the Navy, 1917, at page 866. [Reading:]

Mr. KELLEY. With a reasonable number of submarines at the Canal an enemy fleet could not get very close, could it?

Capt. SIMS. I think I took that question up with the committee when I was here before.

That was in March, I think.

You must understand that a submarine cuts no ice at all as long as your enemy has control of the surface of the area in which he wishes to operate. A fleet has line after line of scouts out, and as soon as a submarine comes along she has to go to the bottom.

Mr. KELLEY. But where you have a comparatively narrow territory to guard, would not the situation be parallel to that along the German coast?

Capt. SIMS. As far as you can reach out with your guns at the Canal entrance, or as far on either side of the entrance as you are willing to build fortifications, you are safe from direct aggression by a foreign fleet, because a fleet can not stand the fire of guns firing from behind hills where they can not be reached by ship's guns; and they can not land within the area which you are disposed to protect by fortifications. But if you have not a fleet strong enough to keep them from coming over here at all they can land outside the area of your forts, and you are at their mercy. It is foolish to suppose that if your fleet is not strong enough to oppose the enemy's fleet and protect the canal that you can protect it by submarines.

Take, for example, the band of water across the English Channel, where hundreds of thousands of troops and hundreds of thousands of tons of supplies have been sent across to the Continent, and transports are going back and forth all the time and nothing happens. That is because that water is thoroughly patrolled.

I do not know whether you gentlemen know how dangerous a sufficient number of patrol vessels can make it for submarines. I have explained that to perhaps 15 or 20 civilian audiences who have wanted to know about the Navy. To give you an idea of what the thing means, let me say this: Suppose this table is the English Channel. The channel is divided into sectors, and each sector is in command of an officer, with a sort of central control for the whole business. They protect the channel against submarines. The channel is regularly patrolled, and that patrol is kept at work all the time. The chances for a submarine to get through that patrol are very small. Suppose, for instance, a submarine was sighted here [illustrating]. As soon as the patrolling vessel sees the submarine she has got to go down. The commander of the patrolling vessel immediately sends out a wireless saying the submarine was at such and such a point at such a time, say 6 o'clock in the morning. By 7 o'clock the submarine will be within that area [illustrating], and by 8 o'clock it will be within this area [illustrating].

The commander of the flotilla at this point [illustrating] will start out his flotilla from this point [illustrating], and deploy on a line from there to there [illustrating] by 8

Digitized by Google

o'clock, and if the submarine is there it will be seen. At the same time aeroplanes go out, and they begin to look for the submarine, and look for traces of the disturbance on the surface of the water caused by that body going through underneath the surface, for although the submarine may be down 100 or 150 feet, there will be a disturbance on the surface. The waves are of a certain regularity on top, and that regularity will be disturbed by any vessel passing beneath the surface. As soon as the man in the aeroplane sees the disturbance on the surface he will notify the destroyers, and a destroyer lowers a net in front of the submarine.

This net is about 300 yards long and about 100 feet deep. It is made of wire rope, not much bigger around than a match, and the meshes are about 10 feet square, and when you bundle it up it makes a very small bundle, and you can put it in a small trough on the stern of a destroyer. The submarine comes along here [illustrating], and this net is put out, and it forms a barrier in front of the submarine. The submarine sticks its nose through one of these meshes in the net and is caught. The floats of the net remain on the surface, and the submarine can not get away from it. If she goes down to the bottom, the patrol boats know where she is, and then the commander of the submarine is ordered to say whether he will come up or not.

That is what makes it dangerous for the submarines to operate in the English Channel. If a fleet is coming along, it has a line of scouts out here [illustrating] and another line there [illustrating], advancing toward the canal, and any submarine that sees the line of scouts knows the fleet is behind, and if the submarine goes down the commander knows that by the time he gets to where the fleet is his ability to steam under the water will be about gone.

The submarine on the surface is like a powerful gasoline automobile; it can run as long as its fuel lasts, but can not use its oil engines when submerged. As soon as the boat goes below the surface it becomes an "electric runabout," being propelled by its electric motors, and when the batteries are exhausted he has to come to the surface or go to the bottom. After he gets to the surface he has to stay until he charges his batteries again. Submarines are no good at all in the face of an enemy who commands the surface of the water.

Mr. CALLAWAY. What have you to say about the action of the submarines when the British fleet was at the Dardanelles?

Capt. SIMS. They attempted it several times. The submarine which torpedoed the three British cruisers at the beginning of the war attempted to attack the British fleet, and so far as we know that is the only one who has ever gotten at the British fleet. When he went down he went under the screens and came up in the middle of the fleet and was promptly rammed and sunk.

Mr. CALLAWAY. At the Dardanelles they went in there and began to bombard everything.

Capt. SIMS. They sank vessels in there. The trouble about the whole business is that there are not enough boats in the world to patrol all the areas you want to control. The British Navy has probably about 200 destroyers with the fleet, and they have to stay there for fear the German fleet will come out.

Mr. CALLAWAY. There were quite a number of ships at the Dardanelles, and they had complete control of the surface of the water, and one submarine went in there and it sank two battleships, and at the time it sank the last one the statement was made that the smaller craft steaming to the aid of the sinking ship were so many that the smoke from the vessels almost obscured the sun, and they did not discover where the submarine came from.

Capt. SIMS. They did not understand at the beginning of the war how to meet the attack of the submarine. That would never happen now. As to how the submarines would be opposed, that is a question of nets. If this fellow goes down to the bottom instead of electing to run, and they wait for him in that area and do not find him they conclude he must be on the bottom.

Did the Navy Department follow your advice with regard to these nets?

Admiral SIMS. I never gave any advice.

Senator PITTMAN. I assumed that that was advice.

Admiral SIMS. Not at all, sir. That was simply repeating a lecture that I heard at the War College by an officer who had been over there during the greater part of the war. Just how much of it was true I do not know. I was informed since that they did in the early part of the war use nets with some success until the Germans got onto it and rigged their boats with appliances that would easily cut a net.

Digitized by Google

Nets were used in the early part of the war with great success, but they soon found that with these net cutters they could stick through any net of any size unless the net would give, as they say, so that it would not bring it up with a halt. All sorts of methods were tried. Just whether those are descriptions of actual things that took place, I am sure I do not know. I listened to this lecture with considerable interest at the War College by a man who had been on the other side, telling what he knew at that time. Of course, a large part of that thing was in connection with what I told them about the Panama Canal, etc. That is entirely true. If you control the surface of the water and have a sufficient number of patrol craft, destroyers, you can go practically where you please in spite of any submarines, as you have seen done all during the war by the Grand Fleet.

The Grand Fleet is the perfect example of the convoy; that is to say, it is so adequately protected that they can go practically where they please with immunity from the submarine. You will find in Admiral Jellicoe's book that during the first, probably, two weeks of the war, while the Grand Fleet used an anchorage at Scapa Flow, which is up in the northern end of Scotland, in the islands, every time a submarine was reported outside in the neighborhood, the fleet always got underway and went out, proceded and surrounded by its screen as being the safest place it could be; because a fleet at anchor or immobile, or going slowly, is always in danger from submarines. Lying in port it is practically helpless unless the harbor entrances are blocked by nets and mines, which was not the case at that time.

Senator PITTMAN. That is all.

The CHAIRMAN. I find that the draft law was passed on the 18th day of May, 1917, and registration took place on June 5, and the drawing took place on July 20, and the men reported on September 5. My recollection is that aside from the men who were drafted, there were a considerable number of volunteers in the war, somewhere around 750,000 I think, and these volunteers included the National Guard. Now, Admiral Sims, can you give me any idea how many of the troops there were serving under the colors on the 1st day of July, 1917?

Admiral SIMS. You mean in our own country or in France?

The CHAIRMAN. Can you tell us, altogether, at that time?

Admiral SIMS. Both in France and America?

The CHAIRMAN. Yes.

Admiral SIMS. I could not give you the figures on that, but it must have been a considerable number.

The CHAIRMAN. Can you give us the figures so that they can be inserted in the record?

Admiral SIMS. Yes; I can get those figures.

The CHAIRMAN. Of how many men there were serving under our colors, both in this country and abroad, on the first day of each month all during the war, up to the 1st day of January, 1918?

Admiral SIMS. I will get that thing to insert in the record.

The CHAIRMAN. How many men had we transported to Europe on the 1st day of January, 1918?

Admiral SIMS. On December 31, 1918, there were 176,665 American troops in France; and but one division had appeared on the front. That is from Gen. Pershing's report, page 18.

Digitized by Google

The CHAIRMAN. Therefore, if we had volunteers to the number of 700,000 to 800,000, and there were only 176,000 in Europe, there were a large number of men before the draft took place, in this country?

Admiral SIMS. Yes, sir.

The CHAIRMAN. Who would have been available for service abroad?

Admiral SIMS. Yes, sir; there must have been. And, anyway, it seems to me that as we actually demonstrated, after the month of April, immediately after the month of April, 1918, that we could send over 300,000 a month and keep it up until there were certainly a million there, it makes it perfectly certain that in the six months preceding we could have done pretty much the same thing if we had had the tonnage; but we did not have the tonnage.

The CHAIRMAN. You have stated this morning, or Gen. Pershing's report as read by you has stated, that we ought to have had an army of 1,000,000 men in Europe by the 1st of May.

Admiral SIMS. The 1st of May, 1918.

The CHAIRMAN. And how many men were transported in May?

Admiral SIMS. Up to May?

The CHAIRMAN. No; in May; during May, 1918.

Admiral SIMS. It was a small number in May. No; in May it was about 233,000. I remember that now.

The CHAIRMAN. And in June, 1918, how many?

Admiral SIMS. I can not quite be sure; but I have the figures here. In April it was 104,000 and in May it was 233,000.

The CHAIRMAN. I want the figures substantially. You can give them afterwards.

Admiral SIMS. There were 233,000 transported in May, and then it began to go up more rapidly and in July there were 317,000.

The CHAIRMAN. And on the 1st day of July there were about a million men on the other side?

Admiral SIMS. Yes; in June there were 285,000.

The CHAIRMAN. The last of June?

Admiral SIMS. Yes.

The CHAIRMAN. Therefore, subtracting the troops that went over in May and June, on the 1st day of May, when Gen. Pershing said we should have a million men there, there were very little over half a million men there; is that true?

Admiral SIMS. Something like 600,000, I should say. I have the figures here now. In April there went over 104,000; in May 233,000; in June 230,000; in July 317,000. Now, we can give you any figures that you would like to have.

The CHAIRMAN. Will you give those figures to the reporter? I have made the point that I had in mind.

Admiral SIMS. These figures show that in the first of May there were 420,000, and in reference to these figures, if you come to compare these with any others, remember this, that these are the figures of our own headquarters in London, representing the arrivals of troops in the port. The report I read to you a little while ago was made by the captain who had charge of the routing of all convoys, and when a convoy arrived with troopships, it was automatically reported to us how many ships we had and how many troops on board. We kept that before us. That did not represent troops at the front or anything except arrivals at the western ports of France, and some in English ports.

Digitized by Google

In France on March 21 there were about 300,000, and on May 31 about 600,000, from Gen. Pershing's report.

The CHAIRMAN. You will get those figures and give them to us, inserting them into the record?

Admiral SIMS. Putting them in the record at this point?

(The figures above referred to are here included in the record:)

TABLE 2.—*Strength of the Army in the United States and in the Expeditionary Forces on the first of each month.*

[From Report of the Secretary of War for 1918.]

Date.	In United States and foreign possessions.	In the American Expeditionary Forces.	Total.
1917.			
April 1	190,000	.....	190,000
July 1	480,000	20,000	500,000
August 1	516,000	35,000	551,000
September 1	646,000	45,000	691,000
October 1	883,000	65,000	948,000
November 1	996,000	104,000	1,100,000
December 1	1,060,000	129,000	1,189,000
1918.			
January 1	1,149,000	176,000	1,325,000
February 1	1,257,000	225,000	1,482,000
March 1	1,386,000	253,000	1,639,000
April 1	1,476,000	320,000	1,796,000
May 1	1,529,000	424,000	1,953,000
June 1	1,390,000	722,000	2,112,000
July 1	1,384,000	996,000	2,380,000
August 1	1,365,000	1,293,000	2,658,000
September 1	1,425,000	1,576,000	3,001,000
October 1	1,599,000	1,834,000	3,433,000
November 1	1,672,000	1,993,000	3,665,000

TABLE 5.—*Men inducted into the Army under the selective-service law, by months.*

[From Report of the Secretary of War for 1918.]

	In United States.	In American Expeditionary Forces.	Total.
In Army Sept. 1, 1917	646,000	45,000	691,000

	Number of men inducted.
1917:	
September	296,678
October	163,644
November	35,721
December	20,320
1918:	
January	23,288
February	83,779
March	132,484
April	174,377
May	373,063
June	301,941
July	401,147
August	282,898
September	252,295
October	250,000
November	10,000
Total	2,801,635

Digitized by Google

The CHAIRMAN. Yes. I want to ask you now a few questions about the convoy plan. The British put a convoy plan into execution on the 21st of May, 1918, did they not?

Admiral SIMS. The first convoy arrived in Great Britain on the 20th of May. They started to put it in about the 1st of May. They sent an officer down to Gibraltar to instruct them on each of the ships, and give them information, and it took some time to train the signalmen, and it took some time to get ready, and then they appointed a convoy commander; and the first convoy arrived in the channel on the 20th of May, and on the 31st of May I cabled the department that they had adopted the convoy in transport. In the first place, on May 1 I cabled to the Navy Department as follows:

British Admiralty has decided to give trial to the convoy scheme described in my last dispatch. Instead of present plan of naval forces operating independently against raiders, there will be a high sea convoy against raiders, such convoy to be established as quickly as possible on all main trade routes, and on approach to dangerous areas on this side will be met by destroyers and escorted into port. Hampton Roads and New York have been proposed as assembly ports for eastbound vessels on our coast and Gulf, with convoys sailing every fourth day. Plan decided on after long consideration by Admiralty and war council, and is considered absolutely necessary. It will strain British resources of personnel and ships to the limit and we must assist by taking one route, at least, if the plan is to be carried out. Admiralty desire to be informed whether we can provide escorts for convoys sailing from the rendezvous at New York. British estimate about 14 ships will be required for New York service, and larger numbers for other routes, including Mediterranean and South America. Escorts should have sustained sea speed of at least 12 knots and 6-inch guns. I very urgently recommend favorable action. Through British naval representative at Washington details of plan will be communicated from time to time as necessary.

SIMS.

That was May 1, 1917. On May 31 I cabled as follows:

With reference to my two previous dispatches concerning convoy system of handling merchant shipping. Scandinavian and North Sea convoys now in force over a month have proved very successful. First ocean convoy from Gibraltar arrived safely on May 20. Second ocean convoy from Hampton Roads of 12 merchant ships escorted by British cruiser sailed May 24. They will be met outside and escorted through submarine danger zone.

The CHAIRMAN. Was that the first American convoy?

Admiral SIMS. The first one from America.

The CHAIRMAN. That sailed on May 24?

Admiral SIMS. May 24. [Continuing reading:]

The department cooperation with the plan set forth in my dispatch of May 1 is urgently recommended. Early reply important in order that Admiralty plans may be governed accordingly.

SIMS.

The CHAIRMAN. And subsequent to that date the Navy Department sent all its merchant vessels over in convoys?

Admiral SIMS. They did not send them over in convoy, and did not get the thing in operation for some months after that.

The CHAIRMAN. What was the date of that?

Admiral SIMS. On July 5 was the first time that the Navy Department agreed to help out in the convoy, and they gave us 7 vessels on that occasion. They said they would provide 7 vessels instead of the 14.

The CHAIRMAN. Then on that date we had in all seven vessels that were aiding in convoy?

Digitized by Google

Admiral SIMS. Seven that they offered, yes, in the cablegram of August 10, 1917. I will read as follows from the department to me on August 10, 1917. [Reading:]

The following is the situation in regard to American shipping. A few vessels route in the established convoys.

That is, a few of their vessels. [Continuing reading:]

More sail direct. Most ships confer with British shipping offices to get the latest information and routes. An effort is being made to induce American ships to take advantage of the protection offered by convoy. It is not possible to compel this except in Government orwned or chartered vessels until the Government takes over the control of all shipping. After studying your numerous cables on the subject, this office is of the opinion that what you want now is for it to furnish, after departure, names, dates of sailing, etc., of the following class of American ships only; those American cargo ships sailing direct and not taking advantage of convoy. In the case of all ships carrying troops, and all Army and Navy cargo supply ships, you wish the information forwarded you.

Will act along these lines unless you instruct otherwise. All other reports of sailings, except War Department reports through you, will cease.

ADMIRAL BENSON.

The convoy system was not in operation generally until certainly after that date.

The CHAIRMAN. At that time was the department doing everything it possibly could to aid the convoy plan?

Admiral SIMS. No, they were not, because they evidently did not take much stock in the convoy plan; and the reason of the thing was probably because of the false estimate of the situation that they made in reference to armed merchant ships. While I was at Queenstown—I have forgotten just the date now—I received a telegram from the Secretary of the Navy which I have mentioned in my direct testimony, which reads:

In regard to convoy, I consider that American vessels having armed guards are safer when sailing independently.

And not very long after that I received another cablegram from Admiral Benson—it was signed "Daniels," but, as I explained before, that means only the department in which it originates, which reads as follows:

The department is strongly of the opinion, based on recent experiences, that the question of supplying adequate guns and trained gun crews to merchant ships is one which can in no wise be treated as a minor issue. Coupled with a rigid system of inspection, this method is believed to constitute one of the most effective defensive submarine measures.

It announces, moreover, as its policy its willingness to cooperate in every way, and will consider the question of supplying additional naval forces of types other than antisubmarine craft, whenever the advisability of so doing is justified.

The department is also considering the outline of a scheme which it is hoped will allow of a greater degree of cooperation and ability to supply escort vessels through the danger zone, without interfering with the destroyers' other duties as much as does the present system of individual escort, and it will not displace the present method of handling merchant shipping from United States ports. Details when prevented (?) will be cabled.

DANIELS,
Secretary of the Navy.

Well, as I explained before, my discouragement on receiving those two telegrams was very great, and I replied to the department giving them actual evidence of the torpedoing within a period of five or six weeks off Queenstown of some thirty-odd vessels, none of which at all had seen the submarine or its periscope. Subsequently I received

Digitized by Google

what we call in the Navy an estimate of the situation, which was drawn up in the Navy Department, and which was based upon this particular measure of the arming of merchant ships, and this estimate of the situation reasoned the whole business out very logically based upon this premise, that if you have armed guard crews on board the merchant vessels in charge of a competent officer, with a well-trained crew, that they will see the submarine in time to protect the ship against the attack by the torpedo. Well, the difficulty about the whole business was that the premise was entirely wrong, as was shown by the information I sent in from Queenstown, out of the experience of the war, of the number of military vessels bristling with guns, and the well-trained mystery ships with guns on board that were out searching for submarines having been torpedoed without warning. And in this estimate of the situation it inveighed against the stupidity of the allied navies in not being able to see this point, and thereby arming their vessels with competent crews and powerful navy guns. That I think must have been the reason why they resisted the convoy system.

But whether that was the reason or not, the convoy system was resisted until the date I stated, I think the 5th of July, when they offered us half the number of vessels that we wanted.

Now I do not want anybody to suppose that I ever expected the Navy Department to adopt any particular measure like that because I, Admiral Sims, said so: In all cases the recommendations that I sent in to the Navy Department were the recommendations that were based upon three years' experience of the war on the other side, daily conferences with the admiralties concerned, with the charts before us of the position of every submarine on the seas, what the movements of those submarines had been, projecting the probable change in tactics of the submarines, and so forth, and based on all that, these recommendations went over. They were not my recommendations. The were the recommendations of the Allied naval armies at the front, and the attitude of the Navy Department was that they were not willing to base their action upon these recommendations until we could explain the whole matter fully to them, and it was up to me to do that over a very heavily overworked cable and by correspondence, with the assistance of one aide, not to mention the fact that I was asked at the same time for information on all sorts of technical subjects, that 20 competent officers could not have supplied. I can give you my word, gentlemen, it was a hell on earth.

The CHAIRMAN. Then, Admiral, it was not until the 1st of September, or six months after we had entered the war, that we were cooperating with the British effectively in the convoy plan?

Admiral SIMS. About that date, yes.

The CHAIRMAN. Do you recall when the convoy plan was first suggested and talked over by the English?

Admiral SIMS. When I arrived in London the whole business was boiling down there in the admiralty. The convoy section, or rather I may say the antisubmarine section, which was in charge of a vice-admiral, was the one that was particularly interested in it. It was up to them to devise means of protecting the shipping, and that office was divided against itself. There was a captain and a number of commanders in that office with all their staff, and the thing was being

Digitized by Google

discussed then, and studies on the thing had been drawn up, and it had not at that time been decided.

Now here is an outline proposal for convoys by the Navy to ports to the north, including the St. Lawrence, and it is a very technical thing, and I do not think it is worth while to read it except to invite attention to the fact that the date is May 5. This was forwarded to Washington on May 4, from the Admiralty to our Navy Department, as a proposal for a convoy system. So they had all the information there in Washington as to what the proposal was.

The CHAIRMAN. What I want to know is whether the British Admiralty was considering the question of running convoys before we entered the war.

Admiral SIMS. Yes; they had been considering it for some time.

The CHAIRMAN. And one of the reasons that they could not do so was that the Navy could not take the destroyers and other ships necessary from the Grand Fleet?

Admiral SIMS. They did not have enough to put it into operation, and the great value of our coming into the war was that we supplied enough destroyers to initiate that thing, and they were supplying 5 or 6 new destroyers a month and it geadually built up from that. But they did not have the cruisers to furnish the ocean escort.

I want to call attention where they had to take the cruisers from. They had been trying to prevent the exit of the German raiders from the North Sea by having a line of patrol vessels extend up to Iceland, and they did head off some vessels and destroy some. The only way they could put the convoy system into operation naturally was to take the cruisers from this patrol system. If they did that, of course they would get no intimation of the raiders coming out. So they wanted to keep these cruisers there to keep back the raiders. They did not have enough cruisers to provide an escort of all the convoys. So that is the reason why they were depending on the United States to help them out and furnish the cruisers, which we ultimately did but only after long delay.

The CHAIRMAN. Admiral, if our Navy had been thoroughly prepared at the time that we entered into the war, and could have provided destroyers and cruisers for the use of the convoy system, is it probable that the British would have started the convoy system at once, if they had known that they could have availed themselves of these ships?

Admiral SIMS. That is their proposal as you see in the telegrams received near the 1st of May, and if we had been ready we could have supplied both the cruisers and the destroyers to put it in operation at once. I do not mean that you can put it in operation like that, because you have got to get information about the merchant steamers, and they have got to be sent to the rendezvous, and you gradually sort them out according to their speeds, and so forth, but getting the convoy system in complete operation would have taken place three or four months earlier if we had been ready with our cruisers and out antisubmarine forces to jump right into it.

The CHAIRMAN. And that in your opinion would have been one of the principal things that would have contributed toward ending the war?

Admiral SIMS. According to figures that I gave this morning, of the losses in the first, second, and third periods, we would have

Digitized by Google

saved 2,500,000 tons of shipping if we had gone in to the thing immediately.

The CHAIRMAN. Have you any comment to make on your letter of November 9 to Admiral Bayly which Senator Pittman read this morning? The letter was read, but no questions were asked.

Admiral SIMS. The only thing I have got to say about that is that it was simply stating to him what the conditions were on the western front. Recently there has been published a review of the whole of the western front at the time of the demand for the armistice, by one of the military critics on the other side, Gen. Maurice, who has been in this country lecturing, and he stated, in almost exactly the same words, what the condition was behind the British front and the French front in regard to the question of transports. I think that anyone who has not looked at a military chart behind an army on the western front and seen the network of big and small railroads and specially built automobile or motor roads can have very much conception of what it means to suddenly move an army forward after a retreating enemy even 10 or 15 miles, when that all has to be renewed. He makes a distinct statement that none of the armies on the western front could have kept their transports going after the advance of the armies farther than they did. It takes too much time to build up the roads. They have to depend on the motor roads. They can not follow up quickly enough on the other roads. That same condition obtains behind all armies. It obtains behind any army for months afterwards.

The CHAIRMAN. In the testimony yesterday an unsigned memorandum was submitted by Senator Pittman referring to the most efficient way to employ America's man power on the western front. Did you, in your capacity as commander of the naval forces on the other side, have anything to do with the question of brigading American troops?

Admiral SIMS. Nothing whatever, so far as concerned anything official. I, of course, discussed it with Gen. Bliss, and I discussed it with a number of other people.

I should like to say in this connection with reference to papers that have been used that are marked "from Admiral Sims's personal file." Of course, in the position that I occupied on the other side, there was a swarm of such arriving every day. Those letters were handled automatically. The only letters practically that I opened were those that were always recognized by my secretary as being in the handwriting of my wife. All other letters were opened, and naturally a good many of them under general orders. They were letters from all kinds of cranks, and all kinds of inventors. There were opinions and avice given to me by everybody from Spainards to Sinn Feiners. Those things were usually answered by some member of the staff, who would file the things in my personal files. The great bulk of those things I never saw at all. Now, when the Secretary of the Navy very late in the war, after giving up the idea of an established historical section in Washington to write up the history of this war, ordered me to establish one on the other side, I did so under the very able command of Capt. Knox, and I told Capt. Knox that he was at liberty not only to take out of the division files anything which he found had any bearing on the war, quite independent of his opinion as to whether it was correct or not, and that he could also go into my personal files and do the same thing, take out any-

Digitized by Google

thing out of the personal files that he though might throw any light on the war.

There are a good many things in there that are exceedingly confidential, but they will be useful to a historian to show the atmosphere. There are letters there written to me by foreign officers of all the Allies in which they have expressed opinions which would be exceedingly embarrassing to those officers to have given out now, but the historian would like to see those things as giving the general atmosphere at the time. I only make this point to show that because a document came out of my personal files, it does not mean that I even saw the document.

The CHAIRMAN. Or that you indorsed it in any way?

Admiral SIMS. Or that I indorsed it in any way.

Senator PITTMAN. Now, Admiral, on January 14, 1918, we have this memorandum——

Admiral SIMS. Who is it from, sir?

Senator PITTMAN. I will read it so as to identify it to you, or a portion of it. I am referring to the one we are discussing.

Admiral SIMS. The memorandum that you were talking about?

Senator PITTMAN. The one that you have been talking about.

Admiral SIMS. Yes.

Senator PITTMAN (reading):

There was a small dinner last night at which were present Balfour, Cecil, and Reading, and the host, a very important person. There was also present another man who holds somewhat radical views as to the most efficient way to employ American man power on the western front, instead of organizing a separate army with its own lines of communication and supply.

The gentlemen above mentioned were greatly interested in the expression of these views and highly approved of them and the discussion turned upon the means to be employed to realize them.

I assume that that meant that Balfour and Cecil and Reading were highly pleased with the plan?

Admiral SIMS. They were more pleased that Gen. Pershing did that thing at a certain stage of the war.

Senator PITTMAN. But this plan of January 14 was not to have "a separate army with its own lines of communication and supply." That is what the memorandum says. Now, then, in the third paragraph of this memorandum it says. [Reading:]

Gen. Robertson went to France to discuss the matter with Pershing, and came back "much disappointed."

The memorandum evidently indicates that the writer of this memorandum considered that Pershing was very much opposed to this plan which appealed to Balfour and Cecil and Reading?

Admiral SIMS. That is the same plan he adopted, is it not?

Senator PITTMAN. That is not the plan that Pershing was for on January 14.

Now, on January 24, I find your letter following 10 days after this memorandum was dated, in which it is said. [Reading:]

You will be interested to know that the question I mentioned to you about the best way to utilize the man power of America on the western front is now up for very serious consideration.

On October 30, 1918, we have the testimony of Mr. Byrnes to a conversation that he had with you in Paris, which has already

Digitized by Google

been put in this record, and came out in the medals-awards hearing. [Reading:]

I shall never forget that interview. The armistice had been requested by the enemy. Sims told us of the magnificient progress made by the British on the English front, and as we listened he proceeded to tell us that the armistice would have to be granted, because Pershing had been unable to break through the German lines, owing to the absolute breakdown of transportation behind the American lines.

That statement was substantiated not only by Senator Glass in his testimony at that time and by a letter from Mr. Whaley, but a letter from Senator Glass in reply to your letter which was introduced in evidence this morning reaffirms it, analyzes it, and adds to it.

Admiral SIMS. Yes.

Senator PITTMAN. Now, then, still later we have this excerpt from another letter that you wrote to Admiral Bayly, of the British Navy, on November 9, 1918, but two days before the armistice was signed. [Reading:]

It had been the opinion that it would be impossible to force the enemy back through the Argonne Forest, not only on account of the great difficulty of the terrain, but also because the troops operating in this area could be supplied only over one main line road. It was hardly thought possible that this road could carry supplies sufficient for the number of troops necessary. There is no doubt that the military opinion was sound, assuming that the attacking forces were not willing to make greater sacrifices than troops are usually called upon to bear. That these sacrifices were necessary is but too apparent. Of course I do not know much about details at present, but enough to know that they were very severe. It turned out as was to be expected.

I want particularly to call attention to this as in line with your thought on this subject, and my opinion is evidenced by everything I have read.

Admiral SIMS. I do not understand.

Senator PITTMAN. I am calling your attention to this particular language as influencing me to believe that you not only had the information on January 24, 1918, that there should not be a separate American Army, but that you had it on October 30, when you talked to Senator Glass, Congressman Byrnes, and Congressman Whaley, but you still had it at the time you wrote this letter two days before. I am calling your attention to this language. [Continuing reading:]

It turned out as was to be expected——

Admiral SIMS. Behind the armies.

Senator PITTMAN (continuing reading):

That the road was not sufficient——

Admiral SIMS. It was not 20 miles long.

Senator PITTMAN (continuing reading):

To supply all the needs of the troops.

Admiral SIMS. That is right.

Senator PITTMAN. You told Senator Glass and Mr. Whaley and Mr. Byrnes October 30, according to their testimony, that you stated that the armistice was necessary because there was an absolute breakdown of transportation behind Pershing's line.

Admiral SIMS. Yes.

Senator PITTMAN. Here it is reiterated again on November 9. [Continuing reading:]

Horses had to be slaughtered to supply the troops, notwithstanding the scarcity of horses at this time. However, there is nothing succeeds like success, and the cutting of the important railway line has been accomplished.

Digitized by Google

Admiral SIMS. Everything that is stated in those letters I told Representatives Byrnes and Glass, and what they did not get and seize is what I have stated here, that I told a lot of other people about it, the same thing, that it was being said, and Glass said that he went to London and was told the same thing there. It was those things that were going around the armies that I was trying to counteract, and they did not seize that point.

As to making a statement that there was a single road there, that is true. There was a single road that they had to use, 20 miles long, and they had a lot of trouble with it. As Gen. Maurice said, they have the same trouble behind all armies. I never had any such idea, that the armistice had to be signed because we could not drive through. The armistice had to be signed because the French people made a protest against the cost of carrying that on after the enemy had asked for the armistice. The position that the Government of France was put in was this: The enemy asked for an armistice, and when you refuse it it means that you are willing to impose upon the army and the people an additional sacrifice. We naval men wanted the German fleet to be surrendered instead of interned. Gen. Foch—I was not present at that interview at all, but I was told that Gen. Foch had said—I might say that we were all called down to Paris. The naval men said what they thought should be the terms of the armistice, and the military men on their side said what they thought should be the terms of the armistice. We had no joint meeting. But I was informed that when we Navy men wanted to insist upon the surrender of the vessels instead of their being interned, Gen. Foch said:

Do you sailormen wish the French people to submit to the sacrifice of from 50,000 to 100,000 more casualties in order to change the word "interned" to "surrender"?

That is what I told many people at that time. We discussed it fully.

As to the first memorandum, I do not know anything about that at all. I do not know where it came from. It has been in my files, like a great many other things that I mentioned a little while ago. I was not present at any time at any dinner where those men were present, Balfour, Cecil, and Reading.

Senator PITTMAN. Now, I call your attention to the similarity of expression in your letter of January 24 to Admiral Bayly and the memorandum. The letters say [reading]:

The best way to utilize the man power of America is on the western front.

The memorandum says [reading]:

The most efficient way to employ America's man power is on the western front.

Admiral SIMS. I did not say that in the memorandum. I do not know anything about it. That is what everybody was talking about, the great subject of conversation between military and naval people. It was Gen. Bliss's idea, that he was going to make a recommendation. When I came to him I asked him if he had done so and he said he had. I understood what the brigading of our troops meant during a certain period of the war. I did not understand it to mean at all at any time a prohibition on the forming of a great American Army. The only point about it was this: If you are going to form an army that can take charge of a whole section of the line where it must be expected that the whole force of the German attack would

Digitized by Google

fall, you must train them month after month behind the line until they understand it thoroughly. That makes delay. The only point at issue was whether or not it was not advisable to brigade them where they would have veterans on each side so that they would act more like veterans, and after they had got experience you could make their army out of them. That is what they did, and I believe that is one of the things that Gen. Pershing is proudest of, that when the crisis came he did brigade them, and they did splendid work, so fine that the Australians commended them very highly on the way they acted, but said that the Americans were a little bit rough.

Senator PITTMAN. In your letter of November 9 you state very emphatically [reading]:

> It has been the opinion that it would be impossible to force the enemy back through the Argonne Forest not only on account of the great difficulty of the terrain but also because the troops operating in this area could be supplied only over one main-line road.

Admiral SIMS. It was quite true that there was only one road. They had to use it. That is all.

There is no recommendation that I ever made on this question. I simply discussed it like any other intelligent man would. It was the question up before everybody, most interesting at that time to everybody, when the crisis was coming. I do not understand just what the idea is. Do you want to try to imply that I was recommending that there should be no American Army? Now, might I ask this question: Suppose it were true that I did recommend an American Army, what does it have to do with the convoy system in the handling of the Navy during the war?

Senator PITTMAN. I think you are entitled to an answer. I will try to answer it. Admiral, in the first place, there are evidences before this committee that you relied very greatly upon the British Admiralty for all of your opinions.

Admiral SIMS. There is no such evidence at all. It was the Allied Naval Council, consisting of the heads of all those navies. Now, how can you conceive an American officer of my experience, not to say record, either being so dumb intellectually or being so defective morally that he would recommend to his Government not what he believed but what the British Government wanted? For God's sake, how can you imagine an American doing that?

Senator PITTMAN. You have asked me a frank question.

Admiral SIMS. And I want an answer.

Senator PITTMAN. I am proceeding to answer. There is evidence here in your own letter that you favored the British policy or the French policy, certainly not the American policy, of sending raw troops over to the other country without training here. It is in your letter here that you recommend that some of these soldiers be put in the navy yards to work as laborers.

Admiral SIMS. Not that they should be worked as laborers, but that an experienced shipwright should not be taken out of the navy yard and put into a camp when we needed ships.

Senator PITTMAN. There is nothing said in your letter as to that.

Admiral SIMS. That is what it says, to take a man of that kind out of the Navy would be asininity, taking him out of the navy yard and making a soldier of him.

Digitized by Google

Senator PITTMAN. There are letters here also which indicate to my mind—that is the reason I am going along with this examination—that you wanted the whole American Navy to be turned over to the British; that as far as the protection of the coast was concerned, or any American policy that they had, that you cared nothing for that. There are letters here indicating that your opinions were formulated with Admiral Bayly with regard to these matters.

Admiral SIMS. I was not with Admiral Bayly one one-hundredth of the time I was over there. I was in London.

Senator PITTMAN. Your letters were very confidential. There is evidence here also that in writing to Admiral Bayly you were opposed to the American plan, and were in favor of the British plan with regard to the disposition of our soldiers; that you were in January opposed to a separate army. There is evidence here that you discussed with Pershing a separate army on October 30. There is evidence that on November 9 you still thought——

Admiral SIMS. There is none of that there.

Senator PITTMAN (continuing). That Pershing had broken down and that you never expected him to get through.

Admiral SIMS. No.

Senator PITTMAN. That you expected he was broken down, by reason of one line of railroad and not sufficient communication.

Admiral SIMS. It was not a railroad at all; a road.

Senator PITTMAN. That communications with the rear were so incomplete that they had been compelled to slaughter horses for food.

Admiral SIMS. All the armies had to do the same thing. What Gen. Maurice said——

Senator PITTMAN. What I think about the proposition is, we are considering whether your advice on these matters was creditable.

Admiral SIMS. All right.

Senator PITTMAN. We are considering as to whether your advice was largely followed.

Admiral SIMS. That is the point.

Senator PITTMAN. And I think that this evidence is material, in that you were advising from the standpoint of foreign countries and not from the policy of your own country.

Admiral SIMS. I see. Well, Senator Pittman, that is the veriest possible kind of rot, for this reason, as pointed out explicitly all through my statement that this advice that was given to my Government was not only based upon all of the discussions that we had with the people over there, but that it was adopted by our own Government. If it were true that the advice I gave has proved to be wrong in the case of the convoy, and in the case of this, that, and the other, there would be something in what you say. But it proved to be right, and was adopted only after those long delays that cost us so much blood and treasure.

Senator PITTMAN. We had a separate army?

Admiral SIMS. You take them and you brigade your troops in there first. I did not recommend a separate army at all. That is all buncombe. It was simply discussions that were going on between two military men about the military questions of the day. There is nothing in there that I wanted to recommend. All I wanted was cooperation and coordination with the British Navy. That was the

Digitized by Google

achievement of the Navy in the war. Here is what the Secretary of the Navy says about it. [Reading:]

Abroad, the Navy has given a demonstration that can only be characterized as wonderful, of its readiness to join with our associates in teamwork for the common end and the common good. * * * (In all areas and with all allied nations.) The United States Navy has cooperated without friction, looking always to the end to be attained, and has won the warmest encomiums and appreciation from our associates. * * *

Much of the above could not have been accomplished at all and none of it could have been accomplished so well, had not the American Navy, from top to bottom, fully appreciated the fact that in war teamwork is absolutely necessary and individual prejudices and ambitions, if they exist, must be sacrified and subordinated for a common end in a common cause.

We worked with those people in teamwork, with the French, Italian, and English officers, independent of nationality.

Senator PITTMAN. Separate entities can cooperate.

Admiral SIMS. They were separate entities, and they cooperated.

Senator PITTMAN. There is quite a difference between cooperating and being submerged.

Admiral SIMS. They were not submerged. They were separate entities, and they were based upon our own supply ships, and they were mobile forces. I have read telegrams to show that we could be moved from one place to another. We were hard up against it when we first went to Queenstown. The necessities were such that we had to cooperate. We did not have enough forces sent over to take over the Queenstown station. Our forces were relatively small, containing destroyers, supply ships, and some sloops. We had no mine sweepers operating there. All those things were necessary in order that those channels and ports be used. We did not have the material to take over the port of Queenstown and patrol the ports and escort in our troops. We worked together. If our destroyers were broken down, our sloops, and so forth, British ships would be supplied. It was necessary that that be done. It was teamwork. The same way pertained in the Mediterranean. The same way pertained in France, where our forces were greater than those of France. It is perfectly absurd to say that we subordinated ourselves to others.

Senator PITTMAN. No; we did not——

Admiral SIMS. Excuse me. There was never a time at all when all the American forces on the other side were not absolutely under the command of men of the Navy Department. They could all have been moved any place.

Now, you may say that we could have been made into a great American Army. It would have been wholly impossible to do it. You must remember that the British had an advantage with their fleet, which they had been years in forming, that we did not have. We had to go on their bases, and there was no place in Ireland where all our force could have been based, the 5 battleships, 140 sloops, etc. There was no possible place where those ships could have been put in a body and effectively used.

Senator PITTMAN. Now, you have read from the Secretary his suggestion as to cooperation. Permit me to read what you suggested to the Secretary of the Navy on July 16, 1917. [Reading:]

It is unquestionable that efficiency would be greatly improved if any one of the Allies—Italy, France, England, or the United States—were selected to direct all operations, the others merely keeping the one selected fully informed of their resources available, and submitting to complete control and direction in regard to the utilization of these resources.

Digitized by Google

Admiral SIMS. Yes; that is not a recommendation. It is an illustration of what would be desirable if the Allies could do that, but they could not and would not. Nobody would dispute that statement, that if the Allies were so amiable with each other as to submit to control, it would be more efficient. Naturally, they were not willing to do that, and so we instituted—our Government did—the Allied Naval Council. And we got together and discussed the best thing to do with the forces available, which were inadequate. They were common sense men. We did not sit there drawing lots in the interest of any French or British or any American or Italian, sitting with that council and advocating that his forces should be subordinate to that of another nation, to the detriment of the common cause. That does not appeal to common sense. That is all I have to say about it.

Senator PITTMAN. Then another question. When you spoke of the available troops in this country by reason of the volunteer service, did you realize that troops are not available when war is declared; are not available by reason of the training not being sufficient?

Admiral SIMS. I did not know anything about that at all.

Senator PITTMAN. Do you know when the volunteer troops, those troops that volunteered, were drawn?

Admiral SIMS. I do not know those dates; no.

Senator TRAMMELL. I want to ask one or two more questions. In regard to the number of troops that were transported by May 1, was that, Mr. Chairman, what you were asking about?

The CHAIRMAN. Yes.

Senator TRAMMELL. The chairman,, I believe, asked you to give the number of troops that were transported by May 1.

Admiral SIMS. I will get the figures.

Senator TRAMMELL. Well, while you are getting that information, I would like you also to get the information as to the number of troops that were transported by June 30, 1918.

Admiral SIMS. June 30?

The CHAIRMAN. I suggest that you get the figures down to July 1, 1918, giving the number transported every month.

Admiral SIMS. All right. The figures will be the arrivals in ports. That is all I have available.

Senator TRAMMELL. I believe it has been suggested here that Gen. Pershing first recommended a million troops by May, 1918, and pertinent to that subject I find this in Gen. Pershing's report. [Reading:]

The War Department planned as early as July, 1917, to send to France by June 15, 1918, 21 divisions of the then strength of 20,000 men each, together with auxiliary and replacement troops, and those needed for the line of communications, amounting to over 200,000, making a total of some 650,000 men.

Admiral SIMS. That is the extract I read this morning and also yesterday.

Senator TRAMMELL. Now, that seems to be the number that the War Department planned for in July, 1917, to be sent over by June 15, 1918. Gen. Pershing goes on to say. [Reading:]

While these numbers fell short of my recommendation of July 6, 1917, which contemplated at least 1,000,000 men by May, 1918, it should be borne in mind that the main factor in the problem was the amount of shipping to become available for military purposes, in which must be included tonnage required to supply the Allies with coal, steel, and food.

Digitized by Google

Now, it seems from this report that Gen. Pershing, in July, 1917, first recommended 1,000,000 men by May, 1918, but we find nothing further in his report hereafter the department had decided on 650,000 men. So the department evidently at that time decided on 650,000 men to be there by the 15th of June.

Admiral SIMS. I understood that Gen. Pershing says 650,000 because there was not tonnage enough to carry any more.

Senator TRAMMELL. He first recommended in July, 1917, 1,000,000 by May, 1918, but after the department had revised his figures in July, 1917, there is nothing further contained in his report that I find here except Gen. Pershing's next recommendation on the 2d of December, 1917, and in that recommendation he recommended four army corps, of 20 divisions each, in addition to troops for service in the rear, to be sent over by the end of June. On December 2, 1917, he recommended that there be sent over by the end of June approximately 1,000,000. Then, later on I find on December 20 he practically repeats his recommendation that they should send over 1,000,000 by June 30, 1918. Now, of course, the figures are important to demonstrate not only the question of whether they sent over those that he first mentioned for May, but also as to whether or not they sent over the troops that he asked for by June 30, 1918. I do not believe you have that information, have you, Admiral?

Admiral SIMS. No; the information that I have is what I read out of Gen. Pershing's report, which were those two that you just read there, which I understood to mean that Gen. Pershing asked or agreed to 650,000 men because there was not tonnage enough to supply more and at the same time keep up the supplies to the other armies. That is what I understood that to mean.

Senator TRAMMELL. Admiral, I believe you stated that you did not know whether the soldiers were trained and were ready to be transported more rapidly than they were transported?

Admiral SIMS. I have no official documents here outside these reports of Gen. Pershing, but I think it is a very fair assumption that if you begin in April, 1918, and jump from 25,000 on an average a month to 300,000 because they brought tonnage in from all over the world to enable you to do it, that if the tonnage had been there they could have done it. The course of this map here [indicating] will show the movements of the troops, how it jumped.

Senator TRAMMELL. In that connection, in view of the fact that Gen. Pershing's report has been quoted from, I will read from an agreement that was entered into which was cabled June 5, 1918, an agreement which had been entered into by Foch, Milner, and Pershing, relative to the number of troops that should be sent over in June and July of that year and in regard to priorities for shipping. I find this clause in that agreement. [Reading:]

(*d*) We recognize that the combatant troops to be dispatched in July may have to include troops which have had insufficient training, but we consider the present emergency is such as to justify a temporary and exceptional departure by the United States from sound principles of training, especially as a similar course is being followed by France and Great Britain.

I just read that to show that it is indicative of the way they felt about it, for probably some of those troops to be shipped in July would not have sufficient training. For some reason, those commanders seemed to think that that was possible.

Digitized by Google

Admiral SIMS. Of course it is not necessary to observe that of an army in the field—of the British Army I think there are about 1 out of 4 that is fighting at the front, and in the French Army 1 out of 2—I am not sure of those figures—but it is something of that kind, and the extreme value of untrained troops is that though untrained in warfare they can relieve perfectly trained men at the rear in a multitude of jobs that have to do with transportation and getting more bayonets at the front, when the great push came, they took Chinese or any men they could pick up to release men that could go forward on the line. If these three distinguished military men got together and pointed out the necessity of sound training of those troops, I guess they knew what they were talking about all right.

The CHAIRMAN. Admiral Sims, a few minutes ago you began a line of testimony which Senator Pittman attempted to bring out. In your letter of January 7 you criticized the Navy Department for lack of cooperation in carrying on the war. This is and will be of course the main purpose of this investigation. It is unavoidable that some side issues will come in during the course of the hearings. That will not deflect us, however, from our main purpose, which is to find out whether the charges made in your letter are or are not true.

Admiral SIMS. I would amend that to say the lack of prompt cooperation. Our Navy Department did cooperate with the Allies eventually. The great difficulty about the whole business is that they did not cooperate promptly. There were all the rest of those delays between recommendations made as the result of the cooperation of the Allied Naval Council and the acknowledgment of the soundness of that by the Navy and the putting of that into operation. That is the gist of the letter, and it would have been a very, very dangerous situation in case we had been up against a navy that was not interned or "contained," as they called it, so far as its battle fleet was concerned, and helpless to do anything against us in our own country except a submarine which had to come over with half the speed of ours.

The CHAIRMAN. That is all.

(Thereupon, at 4.10 p. m., the subcommittee adjourned until to-morrow, Wednesday, March 24, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

WEDNESDAY, MARCH 24, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present, Senators Hale (chairman), Keyes, Pittman, and Trammell.

Senator PITTMAN. Mr. Chairman, before you proceed with another witness, I observe in this morning's press that there are copies of parts of a letter from Gen. Bliss, addressed to the Secretary of War, under date of March 23, 1920, denying certain statements made by Admiral Sims in his testimony upon yesterday, and there is a letter here of the Secretary of War transmitting the letter to the Secretary of the Navy. I have also a copy of a letter of the Secretary of the Navy to the chairman of this subcommittee, transmitting these. I ask consent that they be published in the hearing—the whole matter.

The CHAIRMAN. I received the letter from the Secretary of the Navy, and I replied to him this morning. I will read a copy of my reply. [Reading:]

Hon. JOSEPHUS DANIELS,
Secretary of the Navy, Washington, D. C.

DEAR MR. SECRETARY: I have your letter of March 23 inclosing copy of a letter from the Secretary of War with inclosed copy of a letter from Gen. Bliss to the Secretary of War and a copy of the original order under which Gen. Pershing proceeded to Europe. I note that you wish to have these letters and the accompanying order incorporated in the hearings of the subcommittee of the Committee on Naval Affairs. I think you will agree with me that in the course of the hearings it is entirely improper to insert papers in the record at the request of parties who are not before the subcommittee. You will be called before the subcommittee within a very short time and if you see fit to do so at that time you can of course present any testimony or papers to the subcommittee and they will then be made part of the record. I wish to call your attention to the fact that the papers submitted by you have nothing whatever to do with the very definite criticism of lack of preparedness and prompt support on the part of the Navy Department made by Admiral Sims in his letter of January 7, and that the subcommittee is limited in its investigation entirely to matters connected with this letter.

Very truly, yours,

FREDERICK HALE,
Chairman Subcommittee of Senate Committee on Naval Affairs.

Of course, Senator Pittman, if you as a member of the subcommittee wish to have these papers inserted in the record at the present time, they will be so inserted. If not, the Secretary can bring them up when he testifies before the committee.

Senator PITTMAN. I realize, of course, Mr. Chairman, that a letter has not the same force and effect as sworn testimony; but undoubtedly Gen. Bliss will be requested by some of the committee to testify here later, and as only portions of his letter were published in the press, I think it is only justice to Gen. Bliss that the whole matter should be published.

Digitized by Google

The CHAIRMAN. I have no objection whatever.

Senator PITTMAN. I would just like to have it all put in the record at this time. I think it is only fair to Gen. Bliss.

The CHAIRMAN. I have no objection. It will be so ordered.

(The correspondence referred to is here printed in full in the record as follows:)

The SECRETARY OF THE NAVY.

WASHINGTON, *March 23, 1920.*

MY DEAR SENATOR: In the hearings before the subcommittee on Monday, March 22, Rear Admiral Sims, in his testimony, is quoted in the press (I have not the official report) as attributing to Gen. Bliss the recommendation of the policy advocated by Admiral Sims of brigading the American forces with units of the British armies. I am in receipt of a letter from the Secretary of War this afternoon inclosing a letter addressed to him by Gen. Bliss, saying that at no time did I make recommendation for the brigading of American forces with the British army, but the truth is exactly the reverse.

In his letter Secretary Baker includes also the original orders under which Gen. Pershing proceeded to Europe. Secretary Baker says this order was drawn up by Gen. Bliss and approved by him. He also calls attention to the fact that the policy laid down in the orders to Gen. Pershing "had the direct approval of the President."

I am sending you copies of these letters and accompanying orders that they may be incorporated in the hearings of the Subcommittee of the Committee on Naval Affairs.

Very truly, yours,

JOSEPHUS DANIELS.

WAR DEPARTMENT,
Washington, March 23, 1920.

MY DEAR MR. SECRETARY: In to-day's edition of the Washington Post I noted a comment attributed to Admiral Sims with regard to the "brigading" of American forces with units of the British and French armies, in which certain views are attributed to Gen. Bliss. I beg leave to hand you herewith a full exposition of the attitude of Gen. Bliss on this subject, prepared by him for my information.

In addition to what Gen. Bliss says in his own letter, I have the honor to add that the original letter under which Gen. Pershing proceeded to Europe and assumed command of the American Expeditionary Forces was drawn by Gen. Bliss and submitted to me for approval. I attach a copy of that order and ask attention to paragraph 5 thereof, in which the policy of maintaining the separate and distinct identity of the forces of the United States was laid down. This policy, comprising as it did part of the original orders to Gen. Pershing, had the direct approval of the President and was never departed from by the War Department or by Gen. Pershing, except to the extent indicated in Gen. Bliss's letter, where, to meet a pressing emergency, a temporary association of lesser American units with British and French units was authorized.

I do not know whether this letter of mine, the orders to Gen. Pershing, and Gen. Bliss's letter can properly be tendered to the Senate Committee on Naval Affairs for admission to the record in the inquiry thay are now making, but if it can be done I would be glad to have the record thus made complete on this important subject.

Cordially, yours,

NEWTON D. BAKER.

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF STAFF,
Washington, March 23, 1920.

DEAR MR. SECRETARY: My attention has been called to a paragraph in to-day's edition of the Washington Post with reference to yesterday's hearing of Admiral Sims before a Senate committee. This paragraph is as follows:

"Senator Pittman then read from an unsigned document taken from Admiral Sims's files, urging that American troops passing through Great Britain be brigaded with the British forces. The Senator said this was British propaganda, 'to be used against Pershing's effort to establish a separate American Army.'

Digitized by Google

"'It wasn't written by me,' said Admiral Sims, 'and I object to your calling it propaganda. It is pretty good military reasoning, and what Bliss recommended.'"

No dates are indicated and, therefore, I do not know to what period of the war the statement of Admiral Sims relates, but the following are the facts:

I have a carbon copy of every communication, of whatsoever kind, written by me to or for any person whatsoever, from the time of our entry into the war and on any subject relating to the war. Not only at no time did I make any recommendation for the brigading of American troops with the British Army but the truth is exactly the reverse. The only times that I ever came in contact with Admiral Sims in Europe were while I was with the American Mission (the so-called House Mission), in London between the 8th and 22d of November, 1917. During that entire time the idea of the brigading or amalgamation of American troops with foreign armies had not, so far as I know, entered into the head of anyone. As my report to you dated December 18, 1917, clearly shows, all British military and political men were urging the sending of complete American divisions for the purpose of having in Europe an American national army. I had carried to Europe the information that the United States hoped by about the 1st of June, 1918, to have in France 12 complete and equipped American divisions. In every interview that I had in London from November 8 to November 22, British military and political men urged that this effort must be doubled and that by the end of the spring of that year we should have in France not less than 24 divisions. In Paris, from November 23 to December 6, 1917, the same demand was made. And all of my work in London and Paris, while on the American mission, was directed to seeing how we could secure the equipment and the transportation for the larger American Army which the Allies were then demanding of us. In respect to the few American troops then beginning to arrive in England on commercial liners, the record shows that my only interest was in seeing how we could most quickly get them to Southampton and thence across the channel to France. The idea of "brigading" complete divisions with other groups is an absurdity. During the battle our divisions were at times used to meet an emergency in connection with either British or French divisions; but in the same way, French divisions were used with our troops. At no time during the American Mission's visit to Europe did I hear even the suggestion that our troops should be brigaded either in large or small bodies, with foreign troops.

Nor did I ever make such a suggestion, much less a recommendation.

The first suggestion as to the temporary use of any American troops with those of our Allies was made at the time when they apprehended the near approach of the German drive of March 21 and during the continuance of that drive. On January 29, 1918, the American commander in chief agreed with the British in a signed document that the latter should bring over six divisions in additional shipping which they would release from trade for that purpose, these divisions to be trained behind the British line, and to be taken over by the American Army when their training was completed. This was a distinct gain for the ultimate formation of an American Army, because we would never have obtained this additional shipping in any other way. During the session of the Supreme War Council from January 30 to February 2, 1918, Field Marshal Haig made the statement that he would not want to use British troops in battle which had not been trained nine months at home and five months in France prior to his making such use of them. He concluded by expressing the opinion that "he, consequently, did not consider the Allies could expect the American force, as a force, to be of effective support this year." He thought that the best use to make of them would be to put them "into quiet sections of the line."

Gen. Petain "agreed entirely with the conclusions arrived at by Sir Douglas Haig." He went further, however, and said that "in his opinion the entry of American troops by battalions or regiments into French or English divisions, not only for training, but also for fighting, was much the greatest assistance that the United States could give the Allies and would furnish a solution to the crisis with regard to effectives." He spoke of this as an "amalgamation with the British and French armies." But he then added that "the suggested amalgamation, of course, was only temporary. The American Army would get back its units afterwards and become fully autonomous."

During the discussion of this subject at this session of the Supreme War Council, I was asked for an answer to the question as to whether the United States Government would consent to this amalgamation (which can be nothing else than what Admiral Sims means by the word "brigading"). I then made a statement leading to the conclusion that "such a thing as permanent amalgamation of our units with British and French units would be intolerable to American sentiment." The presiding officer, Mr. Clemenceau, thereupon declared that "this point was settled," and nothing was thereafter heard on this subject.

Digitized by Google

On March 27, 1918, in the very crisis of the battle which began on March 21, the military representatives recommended that in that crisis the American Government send to Europe American Infantry and machine-gun units; that the use, in principle, of those units with Allied troops be permitted; that no American troops then in Europe should be so used; and that the Infantry and machine-gun units referred to should be so used temporarily and only during the crisis and to be eventually returned to the American Army. Before acting on it I took this recommendation to you and Gen. Pershing at the latter's house at 73 Rue de Varonne, where you dictated to the President an approval of the recommendation, based upon "the present emergency," but making it perfectly clear that the training and use of these troops was to be in the discretion of the American commander in chief.

The joint note in which you took this action was not formally considered by the Supreme War Council until its fifth session at Abbeville May 1 and 2, 1918. At this session the American commander in chief was present. The object of this discussion was to learn to what extent the wishes of the Allies could be met without jeopardizing the timely formation of the American Army. After the discussion, the American commander in chief with Gen. Foch and Lord Milner withdrew in order to draw up the details of the proposition. These details were embodied in a resolution of the Supreme War Council of May 2, 1918, the first paragraph of which reads:

"It is the opinion of the Supreme War Council that in order to carry the war to a successful conclusion an American Army should be formed as early as possible under its own commander and under its own flag."

This was the last time that the question of the use of American troops was brought up.

To my knowledge, the question of the "brigading" or the "amalgamation" of American units in foreign armies was not brought up or suggested prior to the session of the Supreme War Council January 30 to February 2, 1918; it was then suggested only by Gen. Petain as a purely temporary measure. No attention was paid to it, even then, until Baron Sonnine, one of the Italian political representatives, insisted on an answer to his question as to whether the United States Government would permit this brigading or amalgamation. The answer having been made, the proposition was promptly vetoed. It was only during the crisis of the drive of March, 1918, and solely to meet that crisis, that the military representatives proposed to recognize in principle the possible temporary use of American Infantry and machine-gun units in the foreign armies. Before that crisis it was not dreamed of and with the speedy passing of that crisis it was not heard of again.

Sincerely, yours,

TASKER H. BLISS,

The Hon. NEWTON D. BAKER,
Secretary of War, Washington, D. C.

WAR DEPARTMENT, *Washington.*

From: The Secretary of War.
To: Maj. Gen. J. J. Pershing, United States Army.
Subject: Command, authority, and duties in Europe.

The President directs me to communicate to you the following:

1. The President designates you to command all the land forces of the United States operating in Continental Europe and in the United Kingdom of Great Britain and Ireland, including any part of the Marine Corps which may be detached for service there with the Army. From your command are excepted the military attachés and others of the Army who may be on duty directly with our several embassies.

2. You will proceed with your staff to Europe. Upon arrival in Great Britain, France, or any other of the countries at war with the Imperial German Government, you will at once place yourself in communication with the American embassy and through its agency with the authorities of any country to which forces of the United States may be sent.

3. You are invested with the authority and duties devolved by the laws, regulations, orders, and customs of the United States upon the commander of any army in the field in time of war and with the authority and duties in like manner devolved upon department commanders in peace and war, including the special authorities and duties assigned to the commander of the Philippine Department so far as the same are applicable to the particular circumstances of your command.

4. You will establish, after consultation with the French War Office, all necessary bases, lines of communication, depots, etc., and make all the incidental arrangements essential to active participation at the front.

Digitized by Google

5. In military operations against the Imperial German Government you are directed to cooperate with the forces of the other countries employed against that enemy; but in so doing the underlying idea must be kept in view that the forces of the United States are a separate and distinct component of the combined forces, the identity of which must be preserved. This fundamental rule is subject to such minor exceptions in particular circumstances as your judgment may approve. The decisions as to when your command, or any of its parts, is ready for action is confided to you, and you will exercise full discretion in determining the manner of cooperation. But, until the forces of the United States are in your judgment sufficiently strong to warrant operations as an independent command, it is understood that you will cooperate as a component of whatever army you may be assigned to by the French Government.

6. You will keep the department fully advised of all that concerns your command, and you will communicate your recommendations freely and directly to the department. And, in general, you are vested with all necessary authority to carry on the war vigorously in harmony with the spirit of these instructions and toward a victorious conclusion.

TESTIMONY OF CAPT. HARRIS LANING.

(The witness was sworn by the chairman.)

The CHAIRMAN. Capt. Laning, can you give the committee any information as to the steps that were taken by the Navy Department in preparing and conducting the naval activities during the late war, and if so will you please state what were your duties in the World War from 1914 up to the present time, showing your own experience and your opportunities for observation? Will you state the matter in your own way?

Capt. LANING. A few days after the announcement in the newspapers that a Senate committee had been appointed to investigate the conduct of the war by the Navy Department, rumors came to me that because of my services in the Navy Department during the war it was more than likely I would be called as a witness. It is anything but a pleasant duty to be a witness in an investigation of the department under which it is my pride and honor to serve, but when it seemed that I might be called before the committee I naturally made all the preparations I could to tell the facts as I know them. I made a careful review of my memory and studied the papers in my possession after which I prepared a statement of the facts. With the consent of the committee I will read that statement.

The CHAIRMAN. Very well.

Capt. LANING. My sole object in presenting the facts as I will is to lay before the committee what I believe to have been serious faults in the administration of the Navy Department in connection with the war, in the hope that the faults being made known their recurrence can be prevented. I therefore request the committee to ever bear in mind that my statement is utterly devoid of personal feeling and that I make it only because it is my duty to do so.

From my knowledge of the Navy and from information gained through personal contact with the Navy Department, I am convinced that since the starting of the World War the department has not administered the Navy as it should have, and as a result the Navy was not properly ready for war when we entered the war, and the Navy did not carry on its part in the war in the early days as efficiently as it could and should have been carried on.

It has taken many things to bring about my convictions, among which I cite the following particulars:

First. That in the years immediately preceding our entry into the war the Navy Department did not take an attitude on legislation

Digitized by Google

and policies that would enable the fleet to be made properly ready for war, and that the fleet was not properly ready when war was declared.

Second. That even when war was imminent, when it was apparent that war could not be avoided, the department even then did not do those things that ought to have been done to make the Navy ready to carry on the war in its full strength and along the right lines.

Third. That at about the time war was declared, although a carefully drawn up plan, outlining what direction the Navy's first efforts should take, was prepared by the office of the Chief of Naval Operations for the department's approval, the plan was not approved, and as a result at the very time a plan was most needed the Navy did not have any general plan that was based on the peculiar conditions imposed by an enemy whose naval effort was restricted almost entirely to the use of submarines.

Fourth. That not having a definite plan to work to, the various parts of the Navy Department could make no coordinated effort to carry on the war, but, on the contrary, each part was obliged to do what that part thought might be best, with the result that not only was the effectiveness of the naval effort greatly reduced in the early stages of the war, but also the cost of the war was probably considerably and unnecessarily added to.

Fifth. That during the war it was always difficult and frequently impossible to obtain the department's approval of essential plans and policies; that this made it necessary for subordinate officers to go far beyond their authority to get things done, and that as a result the difficulties of carrying on the war were increased while the effectiveness was decreased.

It is not possible for me to produce documentary evidence proving every detail of the above five particulars. In most cases where I can not produce documents I can give you the names of officers who can substantiate my statements and can refer you to Navy Department records and reports of congressional hearings where sufficient information can be obtained.

That you may understand my competency to report the facts that follow I will give you a history of the duty I have been performing since the beginning of the World War. At the time of the first declaration of war I was in command of the Reserve Destroyer Flotilla, Atlantic Fleet. On October 5, 1916, I was relieved from that duty and the following day reported for duty in the office of the Chief of Naval Operations and was assigned to duty under the Aide for Material, Capt. J. S. McKean, and became his senior assistant. I remained in that position from October 6, 1916, until July 16, 1917, when at the request of then Rear Admiral L. C. Palmer, Chief of the Bureau of Navigation, I was transferred to the Bureau of Navigation and placed in charge of the Officer Personnel Division, which position I held until September 21, 1918, when I was advanced to the position of Assistant Chief of Bureau of Navigation. I continued as Assistant Chief of Bureau until March 31, 1919, when I was detached and ordered to duty as Chief of Staff, Destroyer Squadrons, Atlantic Fleet, which is my present duty. Rear Admiral L. C. Palmer was detached from duty as Chief of Bureau of Navigation about November 1, 1918, and

Digitized by Google

from that time until the first part of January, 1919, when Rear Admiral Blue became Chief of Bureau, I was the acting Chief of the Bureau of Navigation.

From the time I reported for duty in the Navy Department on October 6, 1916, until I left it on March 31, 1919, I was in very close personal association with the Secretary of the Navy and the other leading officials of the department. Not many days passed when I was not in personal conference with the Secretary on important subjects or placed before him matters and papers requiring his action or signature. I was an adviser on many matters in regard to material while I was in Operations and in regard to personnel while I was in Navigation. During the time I was acting Chief of Bureau I was the principal adviser to personnel matters. Officially I came to know the department and its ways very intimately, and from my close association with the Secretary and my intimate knowledge of departmental and naval affairs I feel I am more than usually competent to gauge the department and its methods. My statements are, therefore, not casually made, but are based on my personal knowledge both as to the officials and to the affairs.

Taking up now the first particular, I will show how the department, by its attitude in regard to certain legislation, made it impossible to have the Navy ready for war either in regard to personnel or material. I in no way intend to criticize the department's attitude on any building program for the Navy, for it has generally advocated considerable increases in our ships. Whether or not the numbers and types advocated were correct is a point on which opinions differ, but it has consistently advocated a large building program. The remarkable feature about the department's attitude was its apparent inability to realize the necessity for legislation that would provide adequate personnel to man the ships or that would provide for adequate money to keep the completed ships fully ready for war. You will notice in every report the Secretary of the Navy has made that he bases our Navy's strength on the total number of ships we have without taking into consideration their actual material condition for war or their being manned for war. It must be apparent to any one that a ship alone means nothing in readiness for war. To be of service a ship must be in a material condition to fight, and it must have a crew not only sufficient to fight it but trained to fight it.

If proof of the failure to realize the necessity for the legislation spoken of above must be had in black and white, the evidence can be gleaned from the recorded hearings before the Naval Committees and from the files of the General Board, Naval Operations, Bureau of Navigation, Construction and Repair, Steam Engineering, and Ordnance, and especially as to personnel from a letter written by Admiral Caperton, Commander in Chief, United States Atlantic Reserve Fleet, in January, 1914, and from the remarks made by Admiral Fletcher, Commander in Chief, Atlantic Fleet, in the "Report of battle practice, spring of 1915." Officers who can testify as to the lack of funds available for work on ships to put them in the best possible fighting trim during the years just before the war are the various officers who were in the material bureaus during that time.

Officers who were afloat at that time, if called upon, can testify to their inability to get alterations essential to fighting efficiency because of lack of funds. Those same officers can testify as to the

Digitized by Google

personnel difficulties on even the best manned ships, and of the other ships that should have been manned and ready that were laid up immobile and therefore useless for war purposes for the want of officers and men. I personally know these things to be facts, and the department itself did not make sufficient effort to have them remedied and they were not remedied. On the contrary such glowing accounts of the Navy and its splendid condition and efficiency were given out by the department that few, if any, outside the Navy realized the true condition. The Secretary's reports, his hearings before Congress, and his statements to the press at that time were to the effect that the Navy was all right and entirely ready.

When the World War started in 1914, to most of the people in this country it seemed advisable that our Navy at least should be made as ready for war as it was possible to make it. We all hoped to keep out of the war, but many realized that a mere failure to be ready for war would not keep us out of it. Most of us realized that on the contrary a failure to be ready might tend to drag us in. In any event from August, 1914, until the spring of 1917 the press, the public, and Congress showed their willingness to have the Navy ready for war. With the plaudits of the country Congress authorized one of the greatest building programs ever known. It was generally understood in the Navy Department and throughout the service that all things necessary to make the Navy ready for war would be granted by Congress if the needs were made known. But even then the needs as to personnel, and personnel will ever be the life blood of the Navy, were not truly presented to Congress. When Congress was seen to be anxious to put the personnel on a sound footing that the ships might be manned for war, the service was astounded to learn that the department had recorded itself against any further increase of personnel, and this at a time when only about half our ships were manned with even peace complements. To prove this you have only to read over the congressional records of the hearings on personnel in the years just before the war.

The result of the failure to supply an adequate personnel for the Navy was fully stated by me to the House Naval Committee in my hearings before it on December 17 and 18, 1918, at which time I was acting chief of Bureau of Navigation. The statement will be found in House Document No. 11, pages 674–680, which statement I will insert in the record. In order to emphasize the personnel situation at the time war was declared and the first few months just after I will read one or two paragraphs from that statement:

At that time, on the west coast of the United States, of our armored cruisers I think all but two of them were manned with partial crews so small that the ships couldn't run. At League Island and other navy yards we had a number of battleships laid up in reserve because we did not have enough people to operate them. We had about 25 destroyers half manned and a number of other ships that ought to have been in operation all the time and weren't even partly manned because we didn't have the men and officers even to half man them. Those ships began to set up a cry for men and officers as soon as the war started, for the ships were needed and needed at once. It wasn't only there we had our trouble. We began to enlist men by the tens of thousands to man our unmanned and undermanned ships and these men had to be trained. Our regular training stations were filled with them and new training camps were set up in many places. Each one of these stations began to call for officers to train their recruits and there were no officers. We were in the predicament of not having personnel to man our ships and also of not having it to even train recruits to man them. A more difficult or serious situation at the beginning of a great war can hardly be imagined.

Digitized by Google

Mr. OLIVER. When was that?

Capt. LANING. That was in 1917, at the beginning of the war, with Germany. Right here in Washington the Chief of Naval Operations needed officers in his office to handle the big operations of war, but they were not to be had. The Bureau of Ordnance was in the same fix. That bureau began to turn out guns and ammunition and needed somebody who knew about guns and ammunition to look after the production, but we didn't have the officers to send to them. Everywhere there was a cry for officers and men that we did not have. We did send green recruits to fill the places of the men we should have had ready and trained, but for officers we had none to send. That was the situation in July, 1917, about three months after the war started when I was called from the office of the Chief of Naval Operations and put in charge of the Officer Division of the Bureau of Navigation. We had 2,394 commissioned officers in the line of the Navy at that time and we actually needed right then and there between six and seven thousand line officers—officers trained in time of peace that they might be ready in time of war. Of all the vast Navy of the United States the only ships we had anywhere near ready were about half our battleships and destroyers, and even they were not up to battle strength in personnel, while the shore end, which is essential to the success of the sea end, seemingly had nothing at all.

The proposition that was put up to me at that time was to make 2,394 officers do the work that about 6,000 or 7,000 should have been ready to do. The enlisted men situation was somewhat better, for we could get the raw material, and though the men weren't trained we could absorb them in the ships and train them very much quicker than we could officers. The situation with regard to men was mighty bad, but the officer situation was desperate.

I want to say that Admiral Palmer and I put in some sleepless nights about that time.

The statement from House Document No. 11, above referred to, is here printed in full as follows:

Capt. LANING. Before we take up the details of our present and future needs I would like to make a statement to the committee as to the personnel situation both before and at the beginning of the war, and to tell you something of what we have done during the war which I don't think anyone knows except the Bureau of Navigation. I think the talk I will give you will make some points clear that would otherwise need clearing up later on.

The CHAIRMAN. Then you go ahead and we won't interrupt you. You can make your statement first and then we can take the other up in the analysis I have indicated.

Capt. LANING. I will do that. For the past 20 years we have been building up the Navy very rapidly. We have had several building programs. Right now we are engaged on the largest building program of any and there is some talk of this session undertaking an even larger building program. In all this increase of the Navy practically very little was done to increase the personnel to man those new ships that were turned out. There was some increase in personnel but it didn't compare with the increase of material, and the result has been that though each year we actually had in commission and in operation more ships than ever before, at the same time we had tied up at docks, unable to operate because of lack of personnel, more ships than ever before. The percentage of those that were not operating was constantly growing in proportion to those that were, and that was all due to the fact that we did not have the personnel to operate all the ships we built or needed to perform either the peace time work or the war work of the Navy.

I want to point out two or three instances of the effect on the Navy of that failure to provide personnel. Go back to 1914, just before the World War started, when we had trouble with Mexico. In a situation like the one we had in Mexico, we should have had our cruisers and gunboats down there to handle it. We didn't have sufficient of those in commission to handle the situation, and so we had to send the battleships and destroyers of the North Atlantic Fleet to do the work. They were taken off their legitimate work, the training and preparation for the kind of work they were built for, and sent down to do cruiser work in Mexican waters. They did the work all right, but at great cost to our training and readiness for a real naval war. We had ships of the right type to handle the task and ought to have had the men to man those ships so that they could have handled that situation without calling on our main fighting force; but for want of personnel those ships were not ready and could not be sent, and we had to send battleships and destroyers to do their work.

Right after that the war began. For lack of personnel we were still unable to operate much of anything except the battleships and destroyers. I remember in 1916 when I was in command of the reserve destroyer flotilla and the revolution in the

Digitized by Google

Dominican Republic started. I had my little flotilla at Key West at that time and we were holding our target practice. I had only half crews, men and officers on those destroyers, and on the *Panther*, which was flagship. The Navy Department had to get somebody down there to handle that Dominican Republic situation. We came in from torpedo practice about noon one day and on the way in I received a radio asking if I could go down there with my little bunch of ships to meet that situation. I promptly telegraphed back that if we could forego gun practice, which we were to start in a few days, I could get away. At 4 o'clock that afternoon I received orders to go. We have eight destroyers. At 7 o'clock that night five of the oil-burning destroyers were on their way half manned with only 2 officers and about 45 men. The next morning I succeeded in getting off two more coal-burning destroyers. There were not enough men in the outfit for both the *Panther* and the other destroyer to go. Either the *Panther* could take the men and go and leave the *Preston* behind, or the *Preston* could go and leave the *Panther*. I telegraphed the department that I had enough men to send either the *Panther* or the *Preston*, but that as it was only one could go, and that before the other could go we had to have some engine-room force. The department sent word to put the men on the *Preston* and that men would be sent for the *Panther*. So I took men off the *Panther* and put them on the *Preston*, but before she could get away I got word for the *Panther* to go. I then took the men off the *Preston*, put them back on the *Panther*, and away she went. The *Preston* was several days getting the men she needed to enable her to move.

Well, we went down to the Dominican Republic and we did our part in that revolution. Those half-manned destroyers were running around that island night and day without sufficient officers or men to properly handle or take care of them, merely because the proper ships for that kind of work could not be supplied with crews, and were therefore laid up and unable to operate.

I stayed there about six weeks and came back, and just about four hours before I got into Key West I got a telegram to send three of those destroyers to Mexico for patrol work. They were still manned with only the 2 officers and 45 men to each destroyer, but they went and did the work.

I cite those instances to show you that even for minor naval operations that came to the Navy in times of peace we, with all of our vast expenditures for the Navy, could not send ships suitable to the task because we did not have men enough to man that class of ships. We not only did not have the cruisers and gunboats ready to meet emergencies like these, but also we didn't have enough to "show the flag" in other countries where there wasn't emergency.

As bad as was the situation for the ordinary naval operations we are called on to perform in time of peace, it was a good deal worse when we came to getting what we had ready for war. We only had about one-half of our battleships fully manned before the war. We had about 30 of our destroyers fully manned and about 25 with half crews. Those were about all the ships the Navy did have fully manned. We wanted to get our fleet ready for business when war came, and naturally we had to engage in maneuvers. In order to get sufficient ships for those maneuvers, we had to use all sorts of subterfuges. We would send a collier out and let her represent four battleships in a big war game, the battleships themselves being unmanned at a dock. That wasn't much of a way to train for war, but without men it was the best we could do. As far as being ready for war was concerned, the readiness and the fighting efficiency of those four battleships was truly represented by the collier, and that is a very good illustration of the Navy's readiness at that time. The Navy ought to be ready to fight with its full strength when war begins. It is the one arm of the service that can't wait. If we do not have our ships manned and ready to go out to fight, it will probably be too late to get them ready after war begins.

When the war actually started for us, the next year after 1916, when we went to San Domingo, we had manned every ship our scanty personnel would let us man, but even then only about half our ships were capable of operating. The North Atlantic Fleet was in Cuban waters. It had in it practically all of the ships that were manned and consisted almost entirely of battleships and destroyers, because we had no men with which to man our other ships, and even these ships were manned at that time with what we called peace complements, which is less than the war complement. We have since learned that a peace complement is something we shouldn't deal with, since it takes fewer men than are required to fight a ship in battle. You can't train a team properly unless you have all the members, and we were training the ships in our main fleet about like you would train a football team with eight men up to the day of the big game, and then on that day put 11 men in. Those ships were better off in men than in officers. The men had been increased a little more rapidly than officers, and when the war started those ships down in Cuban waters had approximately 27 officers and about 85 per cent of what we now know to be the

Digitized by Google

war complement of a battleship. Those 27 officers should have been either 37 or 39 officers if the ships had been properly manned. The ships clamored for men and clamored for officers, and they wanted them right away and badly, and while we could and did furnish them green and untrained men to fill their vacancies, we could do nothing for the officers, which, of course, were not to be had so easily.

At that time, on the west coast of the United States, of our armored cruisers I think all but two of them were manned with partial crews so small that the ships couldn't run. At League Island and other navy yards we had a number of battleships laid up in reserve because we did not have enough people to operate them. We had about 25 destroyers half manned, and a number of other ships that ought to have been in operation all the time and weren't even partly manned because we didn't have the men and officers even to half man them. Those ships began to set up a cry for men and officers as soon as the war started, for the ships were needed and needed at once. It wasn't only there we had our trouble. We began to enlist men by the tens of thousands to man our unmanned and undermanned ships, and these men had to be trained. Our regular training stations were filled with them and new training camps were set up in many places. Each one of these stations began to call for officers to train their recruits, and there were no officers. We were in the predicament of not having personnel to man our ships, and also of not having it to even train recruits to man them. A more difficult or serious situation at the beginning of a great war can hardly be imagined.

Mr. OLIVER. When was that?

Capt. LANING. That was in 1917, at the beginning of the war with Germany. Right here in Washington the Chief of Naval Operations needed officers in his office to handle the big operations of war, but they were not to be had. The Bureau of Ordnance was in the same fix. That bureau began to turn out guns and ammunition and needed somebody who knew about guns and ammunition to look after the production, but we didn't have the officers to send to them.

Everywhere there was a cry for officers and men that we did not have. We did send green recruits to fill the places of the men we should have had ready and trained, but officers we had none to send. That was the situation in July, 1917, about three months after the war started, when I was called from the office of the Chief of Naval Operations and put in charge of the Officer Division of the Bureau of Navigation. We had 2,394 commissioned officers in the line of the Navy at that time, and we actually needed right then and there between six and seven thousand line officers—officers trained in time of peace that they might be ready in time of war. Of all the vast Navy of the United States the only ships we had anywhere near ready were about half our battleships and destroyers, and even they were not up to battle strength in personnel, while the shore end, which is essential to the success of the sea end, seemingly had nothing at all.

The proposition that was put up to me at that time was to make 2,394 officers do the work that about 6,000 or 7,000 should have been ready to do. The enlisted men situation was somewhat better, for we could get the raw material; and though the men weren't trained, we could absorb them in the ships and train them very much quicker than we could officers. The situation with regard to men was mighty bad, but the officer situation was desperate.

I want to say that Admiral Palmer and I put in some sleepless nights about that time. We simply had to get officers and men, and we had to man our ships and carry on our shore work; and not only that, but on the day I went to the Bureau of Navigation the Office of Naval Operations called on us to man and put in operation in carrying troops abroad the 16 huge German ships that formed the nucleus of our transportation force. At the same time they were calling on us from the "other side" for ships to be used in driving down the submarines, and we were taking over yachts, trawlers, and other craft in large numbers, all of which had to be manned and sent over there as soon as possible.

The demand for trained combatant officers literally jumped up by the thousand, and I still had only the original 2,394 to meet the demand. I made an estimate of the situation and reached the decision that there were certain things that simply had to be done. All our destroyers were needed abroad to meet the desperate situation caused by the enemy submarines. Come what might, they had to go over, and we had to man them. The yachts had to get their crews so that they too could fight submarines, while only the transports could carry troops over. We had to man and operate those ships if we didn't do anything else, but also we had to get our submarines and battleships ready too.

Already the battleships had been robbed of their officers until they had only 21 line officers for work that required 37; yet we had to get those battelships in fighting trim. In my estimate of the situation I came to the conclusion that those battleships wouldn't be called on to fight for at least three months, for the British fleet had the Huns locked

Digitized by Google

up, and even if they came out to fight we would still have three months to get ready in. I figured that each day that went by without the Germans coming out we had three months from that day before we would be called on to fight a general engagement, and therefore we had three months we could use to develop and train personnel.

Mr. OLIVER. What do you mean by that?

Capt. LANING. I figured if that if the German fleet came out on any date and by some chance whipped the British fleet—which however improbable it might be, we still had to consider as a possibility—it would be at least three months before they could repair themselves and be ready to tackle us. Of course, each day as it went by without their coming out left us still three months grace for preparation. We decided to take advantage of it.

We couldn't make those 2,394 officers go very far. I believed, however, that we had the finest officers in the world and that by using them as leaven in the dough of the splendid officer material that this country has, we could turn out a loaf that might meet our requirements. The idea was to spread the leaven of trained officers as much as possible, and, making with it the splendid material we had, bring the whole into a fairly satisfactory condition. If we did only what could be done with our few trained officers, our part in the war would be small, but if we could carry out our idea of using them as a leaven and were given the time, we could meet every demand made on us. Every young man who came to us and who seemed to have the qualifications of an officer was to be at once put in training for an officer, and as soon as he had had the rudiments of an officer's training we would send him to a battleship to be further trained and absorbed into her complement.

When we decided to take that step the battleships had already been cut down to 21 or 22 officers when they ought to have had 37 officers, and to place those green young men on them to fill the gaps was, to say the least, an experiment of dangerous character. We believed, however, that they could be trained quickly for the subordinate positions and later for higher positions and that by a process of younger officers understudying older officers and taking over the older officers' duties we could gradually get older officers released from various ships and made available for positions of greater importance on other ships we were taking on.

The plan was certainly radical, and in order to have success with it we had to get the hearty cooperation of every officer in the United States Navy. I went with this scheme to Admiral Palmer, and he said:

"It looks like the only chance we have to do our part in the war, so let us try it; but before we put it into effect we had better talk to the commander in chief and to the officers of the fleet to see if they think it can be done."

If the officers afloat felt that the proposition would not work, and if they would not go in heart and soul and carry it out, it would be impossible to put it through. So Admiral Palmer sent a telegram to the commander in chief and one to Admiral Gleaves, of the cruiser and transport force, telling them that on certain days I would be with them to confer on officer personnel, and on those days to assemble all the admirals, captains, and executive officers for the conference.

The fleet was at a base in Long Island Sound, and I arrived on the *Pennsylvania* the night before the conference. Admiral Mayo was abroad at that time and Admiral Coffman was in command. As soon as I arrived on the flagship I went to see Admiral Coffman. When I went in the cabin, Admiral Coffman, who is my very dear friend, said:

"Laning, I know what you are here for. You want to take more officers away from my ship, and I tell you now you can't do it. You have stripped us now until it is dangerous. If you take any more out you will ruin this fleet."

I replied:

"Admiral, I am sorry that we can't get any more officers from you, for to carry out the plans we must have them; but at least you will let me talk to you about it, won't you?"

He said, "Yes." And I talked to him that night until well after 11 o'clock. When I was leaving the cabin the admiral put his hand on my shoulder and said:

"It is the only way to do it, and I am going to back you up in it. There may be a good deal of opposition to it at the start, but it is the only thing to do."

The next morning I went in to the conference facing all those flag officers and captains, and just as Admiral Coffman did, they knew what I was there for. They knew I was going to suggest that they give us some of those 21 officers they had to do the work of 37; so when I began my talk I faced officers who I knew were naturally hostile to my plan. And well they might be, for I was calling on them to give up more and more of their already too few trained officers and the replacing of them with good material for officers, but material that was absolutely green and untrained. Admiral Coffman knew the situation and met it in a way in introducing me by saying that I

Digitized by Google

had convinced him of the soundness of the plan, and that it simply had to go through. With the probability of a battle on sea, with the life of a nation at stake, it was rather hard to convince the captains of our dreadnaughts that in three months they must still be ready for battle, and during that time must train green officers (as well as their green men), and at the end give up 4 of their trained officers, reducing the number to 17 where 37 ought to be.

I am glad to say they saw the reasoning in our proposition, and when my talk was finished they to a man agreed that it was the only thing we could do that would enable the Navy to do its full part in the war. More than that, they all said that it not only could be done but that it would be done.

I went over to Admiral Gleaves's force and had a similar experience, and when I arrived back in the bureau I told Admiral Palmer that the fleet was with us and our plan could be carried out. We then issued our orders to the service, and from then until the end of the war the Navy trained officers and men while it did its work of the war. So well and so wonderfully did it work that a few outside of the service even dreamed of the desperate situation that we were in at the beginning of the war, but the fact remains that the Navy, as a whole was not ready to fight until many months after the war started. Had we met the German Navy this year we could have faced the result with confidence in the readiness and ability of our Navy, but we must not forget that it was this year before our personnel was ready. The next enemy may not be held in check as were the Germans, and we may be compelled to fight and at the very opening day of the war. We can not and must not again count on having an opportunity to get ready for war after war is declared and for that reason we must always hereafter be ready.

I consider the work of the 2,394 officers we had in the beginning of the war in providing, developing, and training our personnel as the Navy's greatest accomplishment in this war and we should take advantage of their magnificent work and keep the Navy ready. We have paid the price in effort and in treasure and we would be foolish now to waste what has been so dearly bought by allowing the Navy to go back to the condition it was in at the beginning of the war. It serves us nothing to pay billions for ships and then render them useless by not paying the millions it takes to man them. Ships alone can not make a navy or at least can not make a fighting navy. No matter how many ships we may have they count as nothing unless they can fight and to fight they must have personnel. In the last few months the Navy, for the first time in my knowledge, or in yours, has been ready to fight. Let us keep it ready by providing for the permanence of the personnel.

The legislation required to keep the Navy ready naturally divides itself into two parts: First, that necessary to retain what we now have while we are building up our permanent strength and enabling what we have to become a part of that permanent strength; and, second, the legislation necessary to establish a permanent strength. The bureau after long and careful thought has drawn up the legislation covering these two phases, and if the legislation is passed as recommended the United States will at last have a Navy adequate as to personnel and ready to fight with its full strength the moment war is declared. No part of the legislation recommended can be omitted without injury to the service, and I trust that the naval committee will see fit to recommend it as drawn up and that Congress will enact it into law. Economy, efficiency, and the national safety demand this legislation.

Capt. LANING. To further emphasize the situation in regard to the inadequacy of the personnel in the early stages of the war I refer you to a letter submitted to the Secretary of the Navy by the Bureau of Navigation about the end of October, 1918. The letter is dated October 26, 1918, and was prepared by the bureau in accordance with instructions from the Secretary to submit information for incorporation in his annual report made about the end of 1918. The letter begins as follows:

NAVY DEPARTMENT,
BUREAU OF NAVIGATION,
Washington, D. C., October 26, 1918.

To: Secretary of the Navy.
Subject: Information for incorporation in annual report.
Reference: (*a*) Secretary's memorandum of October 15, (*b*) Secretary's letter of October 24.

In accordance with your wishes expressed in the above reference the following information as to the work of the Bureau of Navigation is forwarded for incorporation in your annual report to the President.

Digitized by Google

At the time the United States entered the war, the personnel of the Navy, while of a high standard, was entirely inadequate to meet the needs of war as it is waged to-day. Neither of enlisted men nor of officers were there enough to man the ships of the Navy that were then ready. It was possible to man and put in war operation those ships for which there were crews, but those ships were only a part of our available fighting force. The newer battleships and destroyers were manned and ready when war was declared, but the older ships, including battleships, armored cruisers, destroyers, etc., had only half crews and a few were not even in commission.

It was evident that if the Navy were to do its full share in the war broad plans for expanding the personnel would have to be adopted immediately. Fortunately for us the enemy was not at our doors. The allied fleet that for nearly three years held the enemy sea forces in check were still sufficient to hold them enough longer to get our personnel ready. In this we were very fortunate but we should not again let our Navy personnel be so reduced that we can not on the declaration of war put our full fighting forces into operation.

The plans adopted for rapidly building up our personnel have proved highly successful.

* * * * * * *

Capt. LANING. The letter then goes on to tell what we did in building up that personnel. Further confirmation of the condition as to personnel at that time can be obtained from Capt. L. C. Palmer, then Chief of the Bureau of Navigation, and Capt. L. M. Overstreet, who had charge of the enlisted personnel division. As for the material unreadiness of our ships with the fleet when war was declared, I refer you to a report submitted to the department at that time by Admiral Mayo, commander in chief. That report was made to the Navy Department and should now be on its files or can be obtained from Admiral Mayo's files. Based on the work that it was necessary to do on them at that time and taking into consideration our available repair facilities, it was found that it would take a period of over 100 days to get all battleships of even the active fleet materially ready for war.

I have in my possession the original estimate of the time for this work and later will refer to it and submit it in connection with another particular. Even though you may not care to delve into the department's records and congressional hearings to ascertain that the department did not make sufficient effort to have the Navy ready as to material and personnel, the evidence that the Navy was not ready in these respects, will be before you in Admiral Mayo's letter just referred to and in the statement from House Document No. 11.

Passing on to the second particular that even when war was imminent things that ought to have been done were not done, the following is submitted:

For many months prior to February 1, 1917, our representatives in Germany were reporting on the situation over there. They gave us fairly accurate information of Germany's submarine building program and of her intention to carry on unrestricted attacks on merchant shipping, whether neutral or not, as soon as their submarines were ready. These reports can be found on the files of the Office of Naval Intelligence. But in spite of them the department even then failed to take steps to get the fleet ready for war. As a matter of fact the dreadnoughts did not go to the yards for this work until summer—many weeks after the declaration of war. I wish to point out that had we sent the battleships to the yards in the winter 1916–17, and had concentrated on getting them ready

Digitized by Google

for war so far as material is concerned, they would have been ready at least as to material when we declared war. As it was they were not ready at that time either as to material or as to personnel.

Taking up now, the third particular, on February 1, 1917, Germany announced her campaign of unrestricted submarine warfare. At that time the country practically gave up hope of averting war and certainly then, as never before, there was the necessity of at least preparing plans for a war against Germany. Certainly we should have laid some plans then, to enable us to act promptly and effectively if war should come. But although I was in the office of the Chief of Naval Operations and would have known of them, I did not hear of any such plans. So fearful of the result was I that on February 18, 1917, I prepared a memorandum on the subject. It reads as follows:

MEMORANDUM.

FEBRUARY 18, 1917.

I have been impressed recently with the really little progress we are making toward preparing ourselves for a war under the present situation. Our general plan of war is and has been based on meeting an enemy free to move in general as he pleases with all the various types that go to make up a strong offensive force. We have made little or no preparation for handling a situation like the present where the immediate menace is confined to submarine effort. The final menace, if the submarine effort is successful, will require every force we can raise to meet it and for that reason our first and immediate operations should be to destroy the immediate menace and thereby obliterate the ultimate menace.

From the material point of view there seems to be no general plan for handling the immediate menace. Without any other plan in mind than that developed to meet a situation in no way similar to the present situation, the Navy Department as a whole is proceeding with its task as if there was nothing new in the situation. While those steps must be taken to meet the ultimate menace, there is certainly no concerted action to meet the immediate menace. No one knows what particular task will fall to him to meet the present situation and therefore can not prepare himself for his task. In other words, not knowing what general plan must be followed in a situation like the present, practically the whole department is at a standstill in preparing for it.

I realize that an officially sanctioned plan can not be obtained at present, but is there any reason why a plan can not be made ready for submission and the different offices and bureaus made cognizant of it so that when it is called for the whole department will know just what the different tasks will be and will be prepared to carry them out? It looks to me like the present situation is going to call for a plan of action quite different from any we have been previously trained for or have prepared for. Some definite idea of the plan that much be put into effect to meet it is essential to every cooperating office if the offices are to be prepared to carry out their part. Its principles therefore should be known and the organization perfected to put it into effect with the least delay when it is adopted.

It is not a disloyal act to prepare a plan for use when needed. In fact, I can not but feel that it is our duty to prepare on and to indicate what it is to the cooperating officers that they may be prepared to expeditiously perform their tasks in it. There is now no direction of the present energy. Each part of the organization is directing its efforts only as that part estimates the situation for itself. Some may be headed right and some wrong, but all could be more or less right if a logical general plan were known and energies were directed to meet it.

The country believes we are at least ready to put a plan of some sort in operation, and I feel that we are not doing our duty if we fail to do so. We are not utilizing the days of grace now being given us, and they can be used to enormous advantage if we only know our possible individual tasks if war should come.

Aren't we failing in our duty if we don't do all we can to meet the emergency? The first step to meet is to have a plan and an organization ready to carry it out. Can't we have it?

This memorandum I handed to my immediate superior, who later returned it to me. It shows very clearly the situation in the department at that time.

Digitized by Google

Some few days later, just after the naval appropriation bill of March 3, 1917, was passed, I took the matter up verbally with Admiral McKean, and the following morning, at a conference of all the officers in Operations held in Admiral Benson's office, Admiral McKean brought up the question of formulating a plan for conducting the then inevitable war with the particular view of determining how to best utilize, to meet the then existing conditions, the new resources in money placed at our disposal in the appropriation bill. Admiral Benson then and there told the officers to take the question up and submit plans for consideration. I at once began an estimate of the situation, and on March 13, 1917, submitted the estimate which embodied my idea of the plan we should follow in our first war efforts. It must be remembered that at that time we were in possession only of general information. We had no inside information of the true state of affairs or as to what the Allies would want when we joined them in the war, and for that reason our estimate and decisions at that time had to be restricted very largely to our case at home. Still it was essential that we at once take all the steps we could to prepare both for our own safety and for those things our information showed us we would certainly have to do. It was not known until some time later that the greatest of all our naval efforts would be in overcoming submarines in European waters and in the transportation of troops. I will insert in the record a copy of that estimate and plan.

The CHAIRMAN. Was that plan the plan of the Bureau of Operations that you referred to before in your statement?

Capt. LANING. No; that is leading up to that plan. You will see in a moment, after I have read a little farther.

The CHAIRMAN. Very well.

Capt. LANING. The paper is a long one. It analyzes the war situation as it appeared three weeks before we declared war. It shows what we would have to do to combat the submarines and after summing up our forces suitable for that and other war purposes, divided up the money resources then available to create and prepare the additional forces the estimate showed to be necessary.

A study of the estimate should enable you to see how utterly unprepared we were at that time, in so far as material was concerned, for a war against submarines. It shows that with the exception of 52 destroyers, of which, I may add, only about 30 were manned for active service, the United States Navy had practically nothing with which to combat submarines.

The estimate of the situation is summarized at the end into a decision of 28 parts, each of which covered an action to be taken at once. I will insert the entire paper in the record, but will here read only the 28 parts of the decision:

DECISION.

1. Arm all merchant ships engaged in trade with the allies, cost to be charged to ordnance appropriations. Use guns of 5-inch or larger caliber, if available.

2. Encourage by subsidies and insurance as many additional ships as possible to enter into trade with the allies, arming all that do.

3. Encourage new construction of merchant shipping in all ways.

4. Enter into contracts for all 5 and 6 inch guns and ammunition for auxiliaries that ordnance appropriations permit.

Digitized by Google

5. Rush to completion the 16 dirigibles now contracted for and enter into contracts for 64 more to be delivered as soon as possible.

6. Proceed with the erection of the air-patrol stations for the above dirigibles.

7. Set aside from the emergency fund $10,000,000 for dirigibles, stations, and other aviation purposes.

8. Start construction at once and rush to completion, or charter, 300 large size patrol vessels capable of keeping the sea. Those built should be not less than 110 feet long and should have a speed of not less than 24 knots.

9. Secure by purchase or charter all craft suitable for harbor and in-shore patrol.

10. Make $30,000,000 available at once for the above patrol vessels from the emergency fund.

11. Equip the above-named patrol vessels at once with suitable guns, to be paid for as far as possible from the ordnance appropriations.

12. Make available at once from the emergency fund $5,000,000 to be used by the Bureau of Ordnance to provide additional guns and ammunition for patrol vessels that can not be covered by their appropriations.

13. Provide 100 pairs of mine sweepers by commandeering, charter, or purchase of all available and suitable vessels. If 100 pair can not be obtained in this way construct the others.

14. Allot $10,000,000 from the emergency fund for obtaining sweepers.

15. Equip for sweeping and arm all mine sweepers from present ordnance appropriations.

16. Inform the Lighthouse Service that many largest size spar buoys will be needed for marking swept lanes of travel, and set aside $100,000 from the emergency fund to pay for buoys until Lighthouse Service has funds for the purpose.

17. Provide bases for surface patrols in protected and convenient harbors, setting aside $5,000,000 from the emergency fund for equipping them.

18. Bureau of Ordnance provide 10,000 anchored contact mines.

19. Bureau of Ordnance provide antisubmarine nets in large quantities both for harbor protection, protection of lanes of travel, and for use of patrol boats.

20. Allot $5,000,000 from emergency fund to Bureau of Ordnance for use in connection with their own funds for purchase of mines and nets.

21. Rush to completion the following craft under construction or authorized: First, the five battleships now nearest completion; second, all authorized destroyers; third, all authorized submarines.

22. Set aside $32,250,000 from the emergency fund for rushing the above construction.

23. Endeavor to rush other authorized ships to completion to the greatest possible extent within the limit of their appropriations.

24. Urge upon Congress as soon as it convenes to supply an additional emergency fund of $250,000,000 to complete authorized craft and to provide such other craft and material as may be needed not specially authorized.

25. Make immediate allotment of the remainder of the $6,000,000 appropriated last year to improve yard equipment to the east coast yards.

26. Call for bids on all authorized new construction at earliest possible time and thereby make the $12,000,000 appropriated for improving yards available and at once allot the money to the yards to equip them properly. It must be remembered that additional yard equipment is absolutely necessary.

27. Start the construction of the additional storehouses provided for in the new bill for New York and Puget Sound and allot $5,000,000 to provide for such additional storehouses and depots as may be necessary to handle the increased supplies and material.

28. As soon as Congress meets urge upon them the necessity of bringing our fleet up to the required standard to meet the ultimate menace which, in addition to all the material above provided for, requires the following: Five battleships (first line), 3 battle cruisers, 18 scouts, 26 destroyers, 19 coast submarines (800 tons), 17 fleet submarines, 16 mine sweepers (fleet), 7 mine layers (fleet), 20 fuel ships, 8 supply ships, 5 destroyers' tenders, 8 submarines' tenders.

The estimate above referred to is here printed in full, as follows:

NAVY DEPARTMENT.
Washington, March 13, 1917.

ESTIMATE OF THE SITUATION.

Mission.—The naval appropriation bill having become a law and its funds made immediately available, to determine the best plan for utilizing those funds in the present situation.

Digitized by Google

SUMMARY OF THE SITUATION.

About Feburary 1, Germany announced her intention of destroying all shipping without further warning in certain zones established by herself, around the coasts of the nations in Europe with which she is at war. The United States denying that Germany has a right to destroy any neutral ships without warning and without visit and search and safeguarding lives, at once broke off diplomatic relations with her. Since that time both enemy and neutral ships have been sunk in the barred zone by German submarines without warning, but as yet no United States ships have been so sunk. In order to protect American ships from these illegal attacks the President has ordered the arming of merchant ships and authorizes them to resist illegal attack.

At this time the condition is not one of war, but with German submarines carrying out the announced German policy and being resisted therein by our Government-armed ships, a state bordering on war exists and the situation is such that at any time we may be actually involved in war.

The situation has been gradually developing and in order that the Navy might be ready to meet war conditions, Congress has passed an enormous naval appropriation bill and has made its funds immediately available. If the Navy is to be ready for possible and probable war there is no time to lose in preparing for it. There can be no doubt that Congress and the entire Nation expect us to immediately use such of the appropriated funds as are necessary to prepare ourselves. To fail to use them now to the best advantage may bring terrible disaster to the Nation, but by using them, if war comes, we may bring it to a successful conclusion. But the great reason for using the funds at once and in the best manner is that we may keep from waging war on the vast scale of the war in Europe, even if we do not altogether avert it.

ENEMY FORCES.

Strength and disposition.—The possible enemy forces in the present situation are those of all the Central Allies. On both land and sea their forces are enormous, are magnificently trained and equipped, and are organized in a way beyoud the conception of the vast majority of our population. They wage war in the most scientific way and apparently let no opportunity of injuring their enemies escape. They are brave, resourceful, and ruthless.

Fortunately for us, the tremendous forces of the Germanic powers are not free to operate against us in their full strength. Their vast armies are generally on the defensive and are opposed by armies of greater numbers and as splendidly equipped. To maintain her armies Germany depends entirely on her internal resources, and in this lies her strength. To maintain their armies, the Allies seem obliged to call on the rest of the world, or at least to bring supplies across the sea, and in that lies their strength and their weakness—their strength because of the inexhaustibility and quantity of their supplies, but their weakness because of the danger to their lines of communication.

The huge naval forces of the Central Powers, as great as they are, do not control the sea. Their coast is blockaded, and except for submarines their fleets are contained. So blockaded, except for her power of self-sustenance, Germany would long ago have collapsed, but in spite of her enormous resources and her intelligent use of them she is facing serious shortages of food and possibility of other supplies essential to the conduct of the war.

If the present conditions can be continued, everything points to the Entente's final success, but there is some doubt that these conditions will continue. There is but little chance of victory for the German armies until the Entente's supply lines are broken, and it is at these, with the only weapons she has, that Germany is striking, and in so striking has denied our rights on the sea. It is yet too early to estimate the result of her blow, but it is to prevent the success of the blow that we must bend our efforts. Should we, with the Allies, fail in that effort, success may come to Germany, and should it, it may fall to us to have to meet Germany's full strength alone.

It follows, then, that we must prepare ourselves to render futile and destroy the immediate menace of the German submarine campaign, in order to destroy the ultimate menace of her full strength used against us, but at the same time we must prepare ourselves to meet the ultimate menace if it comes, for unless we are prepared to meet it the very life of our Nation is endangered.

Probable intentions.—The enemy intentions are fairly well understood. With his enormous submarine force he is endeavoring to break the lines of supply to the Entente forces. Should he succeed, he may gain a decision or at least get a draw, either of which would leave him with far greater strength than we have. His submarine pressure works against his enemies in the field and against noncombatants.

Digitized by Google

If he cuts the lines of supply of those in the field, he may win a decision. If he cuts the lines of supply to noncombatants, their demands may force an indecisive peace. He operates with both ends in view. Even though he may not immediately succeed, he may so scare the civil population that their demands will force the Entente powers to sacrifice protection to their fleets to save their populace from starvation. In such case Germany might take advantage of the lack of protection to the Allied Fleet, weaken it by submarine attack, and possibly engage it successfully, thereby gaining to themselves the control of the sea and immediately threatening us, as well as the Allies' communications.

To carry out the above general plan, Germany is already operating her submarines in the "barred zones." That she will continue to operate them there can not be doubted, since it is in those zones that shipping converges, and it is there that submarines are nearest their base. But knowing also that those zones are best defended against submarines it is likely and probable that other much used lanes of travel will be attacked. Naturally, lacking bases, not a great many submarines can be used for distant work, and it would take many to stop shipping at the source. However, it is probable and possible for some to so operate, and it is natural that they should choose to attack in those lanes that are nearest and most frequented. Such lanes are those leading out of our own east coast ports, including the Panama Canal, and it is on these lanes that we must prepare for counter operations at once, even though we do not attempt offensive operations in conjunction with the Allies.

In every instance when a nation has entered this war against her, Germany has at once struck that nation a powerful blow. Such blows delivered as soon as war comes have the double effect of damaging and discouraging the new enemy and reducing his power and of encouraging Germany's own people. There is every reason to believe that should we be involved in the war Germany will make such an attempt at us. We may expect serious attacks from her immissaries within the limits of the country, but such attempts are not to be met by this department. Her one way to strike the Navy a hard blow and a serious one is to operate submarines against the fleet. Germany knows that we have practically no security force in our fleet and that a very small submarine force could possibly deliver a serious blow. We must guard against such a blow.

Germany's probable intentions in the immediate submarine menace have been fairly covered. The ultimate menace, should she get into a position to adopt it, involves the use of her full strength against us. It will probably take the form of an advance across the sea with a naval force to gain control, accompanied by an army to carry out a victorious campaign on land. The details of the methods she would follow are well known to us and will not be taken up here. That we must be ready to meet such a campaign is evident, and while preparing to meet and overcome the immediate menace we must not lose sight of the ultimate menace or fail to prepare for it. Success against the immediate menace may remove the ultimate menace, but to be sure of safety against both we must prepare for both.

OUR OWN FORCES.

Strength and disposition—As compared with the forces of our probable enemy our land forces are insignificent and in no way ready to defend the country. Even though immediate steps are taken to prepare land forces, they can hardly be ready to meet the ultimate menace within a year. Our sole reliance for many months to come must be in the Navy, and the Navy must at once prepare to meet both menaces confronting us.

Our total of naval forces may be grouped into three classes: (1) Ships completed that are now ready for service or that will be ready shortly; (2) ships now under construction or authorized; and (3) the funds made available in the recent appropriation bill for speeding up (2) and for providing material in addition to (1) and (2). It is to determine how to best utilize the third part of our force that this estimate is made, but in order to do that I must ascertain what is needed to meet the present situation, compare it with what is now ready, and then arrange my expenditures to make up the pressing deficiencies as far as possible. I must realize that an expenditure of these funds in any but the right direction, will materially reduce any power to meet the situation, so the greatest care must be exercised.

Not including the Asiatic force, my available fighting force now practically ready for service consists of 12 battleships, first line; 21 battleships, second line; 9 armoured cruisers; 4 cruisers, first class; 3 cruisers, second class; 12 cruisers, third class; 7 gunboats; 5 monitors; 52 destroyers; 11 coast destroyers; 3 mine layers; 4 mine sweepers (with fleet); 6 mine sweepers (coast); 36 aeroplanes; 28 submarines; 3 kite balloons.

Digitized by Google

Under forces appropriated for but not ready we have: Now building—Nine battleships, first line; 1 scout; 27 destroyers; 58 submarines (coast); 3 submarines (800 tons); 3 submarines (fleet); 1 gunboat; 16 nonrigid dirigibles; 78 aeroplanes; 12 kite balloons; Authorized—Three battleships, first line; 5 battle cruisers; 5 scouts; 15 destroyers; 38 submarines (800 tons).

Under funds immediately available that may be used to complete authorized material or to provide material not specifically authorized we have the following:

For aviation	$5,133,000
Ordnance and ordnance stores	8,488,333
Batteries for merchant auxiliaries	4,731,174
Ammunition for merchant auxiliaries	7,731,941
Storehouses, New York and Puget Sound	1,000,000
Naval emergency fund	115,000,000
For equipping navy yards	12,000,000

COURSES OPEN TO US.

In order to ascertain what to do we must first compare the above-listed forces with what we actually need to meet both the immediate menace and the ultimate menace. Let us therefore study the methods of combating each menace and thereby determine our needs after which we will determine how to provide all of them, or not being able to provide for all to provide those things that will best enable us to meet both menaces and hold them in check until we can prepare additional forces.

The immediate menace is from submarines so our first step must be to render that menace futile and to destroy it. It will become futile if, in spite of it, we and the entente allies can maintain the allies' overwater lines of supply. If we destroy it our first mission is gained. How can we do those things?

Submarines have only three offensive weapons—guns, mines, and torpedoes. Of these the gun is naturally the favorite for use because by its successful use it does the most damage at the least cost. To use guns the submarine must operate on the surface, but so operating, owing to the very few guns they carry and the vulnerability of the ship, they are easily sunk by gun fire. A submarine can not operate on the surface against armed ships and hence properly arming ships requires that submarines attack while submerged and denies the use of their guns.

With their guns eliminated, submarines must depend on mines or torpedoes. Of mines they may carry both the floating and the anchored types. They are not well suited for using floating mines and at best such mines do not meet their requirements. Good lookouts usually enable a ship to avoid them. Anchored mines are more suitable but submarines can carry only a few of them and when laid they can be quickly destroyed by sweeping. They can not be used in over 50 fathoms of water, and as the quantity is limited they must be placed in the approaches to harbors. To eliminate the danger from mines requires that we must keep certain lanes for ingress to or egress from our harbors, free of mines. This requires sweeping, for which special types of boats especially fitted for their work, are required. Owing to the facility with which mines can be placed and the large areas along our coast that are suitable for mineing work, we will require a very large force of mine sweepers, but with such a force the dangers from anchored mines, placed by submarines, will be a minimum.

With guns and mines practically eliminated the only other weapon carried by submarines that we need fear is torpedoes. Torpedoes are powerful weapons, but they are expensive and submarines can carry very few of them. By arming merchantmen we force submarines to depend almost entirely on torpedoes for their offensive operations and to remain submerged while attacking. This alone greatly reduces the danger from submarines, for working submerged they can use only slow speeds, can not choose their positions, and have great difficulty in getting the course and speed of the target upon which knowledge accurate torpedo fire depends. But while arming merchant ships practically insures their safety from gunfire and coincidently renders torpedo fire less successful, these steps only tend to render submarine warfare futile. We must expect many casualties even after we arm merchant ships, and the only way to stop those casualties is to effect the destruction of the submarines. How can we effect their destruction?

To destroy submarines we must first locate them and then sink or capture them. A submarine's safety lies in her ability to completely hide beneath the surface of the water. Its greatest weakness lies in the fact that it can not remain submerged for any great length of time except while resting on the bottom in less than 30 fathoms of

Digitized by Google

water. It follows then the best means of destroying submarines is to utilize the most suitable device for locating them and when they come to the surface to bring to bear on them sufficient gunfire to destroy them. The best position for seeing submarines is from aloft. We can locate them from surface craft, but eyes well above the sea not only cover larger areas of water but can see better. Aircraft are therefore a necessity Aeroplanes being heavier than air and entirely dependent on speed to remain up, are unsuited as air patrol for submarines. Lighter-than-air craft are especially suited for the work, being more habitable, better arranged for the work, able to cover as much water, having great speed, and being capable of moving slowly in any direction if desired. It follows that we should have small lighter-than-air craft for the purpose. The small rigid dirigible appears best suited for it.

To give us the gun power to sink submarines when located by the dirigibles we must have patrol boats suitably armed near at hand. To have them near at hand at all times means that they must be available in great numbers. Those that operate close in shore may be only large enough to carry the necessary size guns, but those that operate well out at sea must be large enough to withstand any and all weathers and be able to keep the sea. It would appear, then, that we must have many large patrols and many small patrol boats, but for outside work the minimum size would be the 110-foot boat.

In addition to destroying submarines by gunfire we may also destroy them by mines placed in areas they will infest. Nets to entangle submarines can also be used to great advantage, especially in shoal waters. They should be used to protect all harbors and, if available in sufficient quantities, to protect lanes of travel of shipping. Patrol boats should be fitted with entanglement nets.

It would appear, then, that the steps to meet the immediate menace are:

(1) To arm all merchantmen, but especially those carrying supplies to the entente powers.

(2) To increase the number of merchantmen carrying supplies to the Allies to insure that these supplies will be sufficient.

(3) To provide mine sweepers sufficient to sweep all lanes of travel from our harbor entrances to water of 50 fathoms depth.

(4) To provide sufficient buoys to mark the lanes of travel kept clear of mines.

(5) To provide sufficient rigid dirigibles to maintain a close air patrol over the established lanes of approach to our harbors and the waters adjacent thereto.

(6) To provide surface patrol vessels, large and small, the former to operate offshore to destroy submarines, the latter to patrol the lanes of travel for shipping and the harbors, both cooperating with the aerial scouts already mentioned to destroy submarines.

(7) To provide anchored mines in large numbers.

(8) To provide submarine nets to cover the outside entrances to all harbors and lanes of travel if practicable, and to equip patrol vessels.

What quantities of the above-described material do we need? At this time it is utterly impossible to tell the total amount we will require but it is far more than the money at our disposal will buy and more than our resources can produce in a short time. We should attempt to provide as much as possible of each kind at once, bearing in mind that no matter how much we get now it will be far short of what we must finally have if war comes.

In the present situation all armed merchant ships become auxiliaries and to equip them we can utilize what guns and ammunition we now have ready for arming auxiliaries. While we have not a great many guns for the purpose we can probably arm most of our shipping that now goes to Europe. But as more shipping enters for that service more guns and ammunition will be needed.

In arming ships we must bear in mind that they must have gun fire superior to that of the submarines. From this it follows that guns for merchantmen should be of equal or greater size than are carried by submarines and they must be so placed as to permit at least two to five in every arc. Depending on the way ships can mount guns they should have three or four guns of 5-inch calibre or larger. To provide these, contracts should be entered into for all the 5 and 6-inch guns and ammunition for them that can be purchased out of the appropriation "Batteries for merchant auxiliaries, $4,731,174," and "Ammunition for merchant auxiliaries, $7,731,460." Three-inch and 4-inch guns can be used to arm ships until larger guns are available, but all future guns for shipping should not be below 5 inches.

To provide more ships for carrying supplies to the Allies, the United States Government can not itself do much at once. If ships are to be provided by the Government they must come from other than the present naval appropriations. We can and should

Digitized by Google

encourage private ships to enter the trade by offering insurance or subsidies, for it is of vital importance that the supplies to the Allies be maintained. On the success of maintaining them a favorable decision for the Allies rests and their success now means our own success at the least cost.

To provide mine sweepers will not be very difficult. There are already many small tugs and steam fishermen that can be quickly taken over by purchase or charter, and sweeping equipment is easily obtained. The number of sweepers so obtained will probably not be sufficient and we may have to construct many. We should provide for at least 100 pairs immediately, arming each with a small gun, preferably a 3-inch. The sweepers will have to be obtained out of the "emergency fund" and $10,000,000 should be set aside from that fund for the purpose. The battery, ammunition, and sweeping equipment of the sweepers will have to come from the ordnance appropriations "Ordnance and Ordnance Stores" and "Reserve Ordnance Supplies," etc.

In order that there may be proper buoying of swept lanes, an enormous number of buoys must be provided. These buoys should be provided by the Lighthouse Establishment and notice should be sent them immediately to provide those buoys. As the Lighthouse Establishment may not have funds at this time we could possibly contract for them and arrange for reimbursement later. To make sure that the buoys will be ready we should set aside $100,000 for them from the emergency fund. The Lighthouse Establishment should be informed of the lanes to be kept swept and should plan the buoyage system to mark them.

Our coast air patrol as now arranged for provides for 15 stations. It seems that 4 dirigibles would be the minimum for each station and that those stations near important ports where close patrol is necessary should have more. We have 16 dirigibles ordered and need 44 more to equip stations to the minimum, but if we get 80 all told that should be enough for a start. That means 64 more dirigibles than have been ordered, and these will cost about $50,000 apiece. They should at once be ordered from the appropriation "Aviation, $5,133,000." But in addition to providing dirigibles we must provide places for their stowage and operation. Of these we have none and they will cost much. We must allow $10,000,000 from our emergency fund for aviation purposes in addition to the "Aviation" appropriation.

Patrol vessels to be provided are of two classes—those for inshore work and those for offshore work. There are many small craft available for inshore work that can be purchased or chartered and perhaps not many small boats will have to be built. A very different situation holds for the larger patrols for offshore work. There are some fair-sized yachts immediately available by charter or purchase but in addition to which we require many more. We should allow for at least 300 offshore patrols at a cost of $100,000 each ($30,000,000). For patrols $30,000,000 of the emergency fund should be immediately utilized. The arming and equipping of these patrols will have to be paid for from the Ordnance appropriations or other bureau appropriations.

Bases will have to be provided for these patrols and funds must be found for them, since without bases they can not be maintained. Makeshifts can be provided if funds are available, and at least $5,000,000 will be required for that purpose.

Mines will have to be provided from the Ordnance appropriation and in large numbers. Ten thousand should be provided for at least. Submarine nets also come from the Ordnance appropriations and are needed in enormous quantities. The Ordnance appropriations are probably insufficient to provide for as many nets and mines as are needed at once, so we should allot $5,000,000 for those purposes from the emergency fund.

Up to this point we have discussed only those materials to meet the immediate menace. What we have found necessary to provide so far is material to meet that menace alone. But what should be done to meet the far more dangerous ultimate menace? To meet that requires that I must have a strong and well-balanced fleet. It is not sufficient to merely have the power to strike, for unless I have a security and information of force the enemy can attack my heavy ships at will, while I can not attack him because I can get no information of his whereabouts. A study of what will be required to meet the ultimate German menace shows what we should have. Without going into the reasons, the force we require is indicated in the second column of the table given below. In the third column I have listed what we now have; in the fourth column what must be provided to give us the needed strength; and in the fifth column what has been done toward providing the material column three indicates as necessary.

Digitized by Google

Type.	Number required.	Now ready.	To be provided.	Steps taken to provide missing units.
Battleships, first line	27	12	15	9 building, 3 authorized, but not contracted for.
Battleships, second line	21	21	.....	Completed.
Battle cruisers	8	.....	8	5 authorized, but not contracted for.
Armored cruisers	9	9	.....	Completed.
Scouts	24	.....	24	1 contracted for; 5 authorized.
Destroyers	120	52	68	27 contracted for; 15 authorized.
Submarines, small	87	29	58	All under construction.
Submarines, coast	60	.....	60	3 contracted for; 38 authorized.
Submarines, fleet	20	.....	20	3 contracted for.
Mine sweepers	20	4	16	None.
Mine layers	10	3	7	Do.
Aeroplanes	114	36	78	All been ordered.
Fuel ships	40	20	20	4 building.
Supply ships	12	4	8	1 building.
Destroyer tenders	8	3	5	3 authorized.
Submarine tenders	12	2	10	2 authorized.

With the material previously mentioned as necessary to meet the immediate menace and the material listed in the second column above, we should be able to meet even the ultimate menace. We may not even with those forces be able to win a decision over Germany, but it is practically certain that she would not be able to decisively defeat us. It is, however, the minimum we should have to be even reasonably safe from defeat.

It is seen from the above table that we have much to do. It might appear at a first glance that we should at once prepare to meet the ultimate menace by completing all authorized ships and starting additional ships as necessary. Such would be the case if we had sufficient funds to do that after providing for the immediate menace. But we have not. After providing for the immediate menace as indicated above, we have less than $55,000,000 available in the emergency fund which is not even sufficient to rush to completion all authorized ships, much less to provide for additional destroyers and other small craft. To determine how best to handle our remaining funds we must analyze our building program.

Of the nine battleships authorized, the actual construction of only five has been started. Three of these are well along in completion and two are started. All five may be completed before the ultimate menace comes and we may act wisely in expediting them. It is not probable that the other three authorized can be made ready in time to meet that menace and therefore to use any of our emergency fund on them would be useless. They should be expedited to the fullest extent within their special appropriations and steps should be taken to provide money to allow the work to be rushed. Of the five that can be expedited, $1,000,000 each should cover the cost of expediting the three that are furthest advanced and $2,000,000 each for the other two.

The battle cruisers and scouts, excepting one scout, have not yet been contracted for. It is doubtful if any of them can be completed in time to meet the ultimate menace, so it is useless to spend our present small emergency fund on them. They should be expedited as much as possible under their present appropriations and other appropriations should be asked for to expedite these and to build the many others required.

Being without scouts we urgently need destroyers. We should get all we can at the earliest possible time, not only by rushing to completion all that have been provided for, but also by building as many more as we can put on the ways. We have 27 contracted for and 15 more authorized, and all these can be rushed to completion at an average cost of not over $200,000. We should allow money from the emergency fund for the purpose, but should ask for more money to provide additional destroyers and rush them to completion.

Perhaps our greatest immediate need for meeting the ultimate menace is to have many submarines. We can not win a decision with submarines, but it is probable that with sufficient of them we can keep the enemy from gaining one over us. A large submarine force will prevent an invasion for a while at least, and they should therefore get our very great attention now. We should rush to completion all that are now authorized and build as many others as the building capacity of the country permits; and Congress should be asked to provide them.

Of submarines we have 58 small size contracted for, and they can be rushed to completion at an average cost of not over $150,000. We have three 800-ton submarines contracted for and 38 authorized that can be rushed to completion at a cost of not over

Digitized by Google

$250,000 each. We have three fleet submarines under construction that can be rushed to completion at a cost of not over $300.000 each. We should provide for rushing these from the emergency fund, but should at once ask for additional funds to provide more.

A summary of the rush work that should be undertaken on new construction and its cost is shown in the following table:

Ships on which work should be rushed.	Number.	Cost per ship to rush.	Total cost to rush.
Battleships, first line	3	$1,000,000	$3,000,000
Do	2	2,000,000	4,000,000
Destroyers	42	200,000	8,400,000
Submarines:			
Small	58	150,000	8,700,000
Coast	41	250,000	10,250,000
Fleet	3	300,000	900,000
To be allotted for speeding up construction			35,250,000

The remaining ships called for on our list to meet the ultimate menace should be rushed to completion also, but not at the expense of our emergency fund. Congress should be urged to provide for these.

No consideration has as yet been given the essential shore stations and bases for handling these large amounts of material required for either menace, yet in order to maintain the upkeep of that material and to supply it requires vast additions to our shore plants. Our facilities for handling our fleet upkeep work are constantly strained even in peace times. They simply can not handle a larger fleet under war-time conditions. Toward supplying the fleet we find the same inadequate preparation. Fortunately we have some appropriations that can be used to meet these emergencies outside of our emergency fund.

We have the remainder of the $6,000,000 made available in last year's appropriation for equipping yards for building ships, and $12,000,000 available from the new appropriation in the event the Secretary of the Navy is unable to secure from the private shipbuilders contracts for the expeditious construction of the ships heretofore authorized at a fair or reasonable price to enable him to equip the navy yards with suitable and necessary machinery, implements, building ways, and equipment for the construction of such of said vessels as may be assigned to navy yards for construction. It is practically certain that private shipbuilders will be unable to construct expeditiously at a reasonable price all the ships authorized, and therefore the total, $18,000,000, will be available for adding equipment to yards, which, while installed for building purposes, would be available and used also for upkeep purposes. The need of equipping yards is pressing and no time should be lost in making all the funds available and allotting them to yards for equipment, etc. These $18,000,000 available should be sufficient to cover the yards' needs for upkeep work and I need not consider utilizing any of the emergency fund for that purpose at this time.

Supplying the fleets in peace times has reached a high state of perfection, but the preparations are insufficient for an increased fleet, and especially so under war conditions. The bill contained two items of $500,000 each for storehouses at New York and Puget Sound, but while these will help they will not nearly meet the requirements. Central distributing depots will have to be provided, as well as smaller distributing stations. The stations may be of a temporary nature, but funds must be provided for them at once. We should set aside $5,000,000 from the emergency fund for that purpose.

It is also to be noted that the tremendous augmentation of naval craft necessary to meet the immediate and ultimate menace requires tremendous additions to our fuel depots. This is especially true of oil fuel, for while there will not be a very great increase in coal burning craft there will be enormous additions of oil burners. Even now our fuel oil storage is inadequate and not underground, as is necessary for its proper protection. As establishing fuel-oil stations requires special appropriations for the purchase of land, Congress should be asked to make special appropriations for the purpose. Estimates have been asked for storing 2,000,000 barrels of oil to meet the fleet requirements at a cost of $10,000,000 and that amount should be asked for, for the purpose.

A particular feature that must be borne in mind in this estimate is that the machinery and personnel of the department in Washington was designed largely on a peace basis. With the vast expenditures provided in the naval bill the activities

Digitized by Google

in the departments are multiplied. Technical experts, draftsmen, material experts, clerks, and stenographers are absolutely necessary to all bureaus and offices to carry on the huge increase of work, yet the wording of the appropriation bill is such that no part of any sum appropriated in it can be used for any expense of the Navy Department at Washington, unless specific authority is given by law for such expenditures. This situation is so serious that unless steps are taken to provide the additional personnel necessary to handle work in the department the whole program may be seriously interfered with. Immediately upon the convening of Congress steps should be taken that will permit the employment of the essential personnel.

Up to this point we have covered to some extent the things we need immediately. We must realize that we have not made sufficient provision to fully meet either the immediate or the ultimate menace, but if we do all that has been laid out we will have gone far and in the right direction. We will at least have started some of the things urgently and immediately needed without which we are practically helpless. Before we get this material, Congress will again be in session and if more is needed, there is no doubt but that provision for it will be made. Having started the work, it will be easy to continue and tremendously increase it if necessary.

The total money that should be allotted now is about $10,000,000 less than what we have at our disposal. It is not safe to set it all aside at this time as there are surely other things that will be needed at once. If we find the $10,000,000 remaining will not be needed for other purposes, we can devote it to increasing our material along certain of the lines indicated above.

Therefore, in order to provide for the country's safety as seems to be the wish of the people, and to carry out the intent of Congress, we should at once allot money in accordance with the following decision and proceed to carry that decision out as rapidly as possible.

DECISION.

1. Arm all merchant ships engaged in trade with the Allies, cost to be charged to ordnance appropriations. Use guns of 5-inch or larger caliber if available.
2. Encourage by subsidies and insurance as many additional ships as possible to enter into trade with the Allies, arming all that do.
3. Encourage new construction or merchant shipping in all ways.
4. Enter into contracts for all 5 and 6-inch guns and ammunition for auxiliaries that ordnance appropriations permit.
5. Rush to completion the 16 dirigibles now contracted for, and enter into contracts for 64 more to be delivered as soon as possible.
6. Proceed with the erection of the air-patrol stations for the above dirigibles.
7. Set aside from the emergency fund $10,000,000 for dirigibles, stations, and other aviation purposes.
8. Start construction at once and rush to completion, or charter, 300 large-size patrol vessels capable of keeping the sea. Those built should be not less than 110 feet long, and should have a speed of not less than 24 knots.
9. Secure by purchase or charter all craft suitable for harbor and inshore patrol.
10. Make $30,000,000 available at once for the above patrol vessels from the emergency fund.
11. Equip the above-named patrol vessels at once with suitable guns to be paid for as far as possible from the Ordnance appropriations.
12. Make available at once from the emergency fund $5,000,000 to be used by the Bureau of Ordnance to provide additional guns and ammunition for patrol vessels that can not be covered by their appropriations.
13. Provide 100 pairs of mine sweepers by commandeering, charter, or purchase of all available and suitable vessels. If 100 pairs can not be obtained in this way, construct the others.
14. Allot $10,000,000 from the emergency fund for obtaining sweepers.
15. Equip for sweeping and arm all mine sweepers from present Ordnance appropriations.
16. Inform the Lighthouse Service that many largest size spar buoys will be needed for marking swept lanes of travel and set aside $100,000 from the emergency fund to pay for buoys until Lighthouse Service has funds for the purpose.
17. Provide bases for surface patrols in protected and convenient harbors, setting aside $5,000,000 from the emergency fund for equipping them.
18. Bureau of Ordnance provide 10,000 anchored contact mines.
19. Bureau of Ordnance provide antisubmarine nets in large quantities, both for harbor protection, protection of lanes of travel, and for use of patrol boats.
20. Allot $5,000,000 from emergency fund to Bureau of Ordnance for use in connection with their own funds for purchase of mines and nets.

Digitized by Google

21. Rush to completion the following craft under construction or authorized: First, the five battleships now nearest completion; second, all authorized destroyers; third, all authorized submarines.

22. Set aside $35,250,000 from the emergency fund for rushing the above construction.

23. Endeavor to rush other authorized ships to completion to the greatest possible extent within the limit of their appropriations.

24. Urge upon Congress as soon as it convenes to supply an additional emergency fund of $250,000,000 to complete authorized craft and to provide such other craft and material as may be needed not specially authorized.

25. Make immediate allotment of the remainder of the $6,000,000 appropriated last year to improve yard equipment to the east coast yards.

26. Call for bids on all authorized new construction at earliest possible time, and thereby make the $12,000,000 appropriated for improving yards available, and at once allot the money to the yards to equip them properly. It must be remembered that additional yard equipment is absolutely necessary.

27. Start the construction of the additional storehouses provided for in the new bill for New York and Puget Sound and allot $5,000,000 to provide for such additional storehouses and depots as may be necessary to handle the increased supplies and material.

28. As soon as Congress meets urge upon them the necessity of bringing our fleet up to the required standard to meet the ultimate menace, which, in addition to all the material above provided for, requires the following: Five battleships (first line), 3 battle cruisers, 18 scouts, 26 destroyers, 19 coast submarines (800 tons), 17 fleet submarines, 16 mine sweepers (fleet), 7 mine layers (fleet), 20 fuel ships, 8 supply ships, 5 destroyer tenders, and 8 submarine tenders.

I have introduced this paper not only because it is an item of proof, but also and more particularly because it gives you some idea of how decisions are reached as to what to do in war and shows what we should have been doing weeks before we actually declared war. That Congress expected us to do those things was evidenced by the huge appropriation bill of March 3, 1917, that Congress had rushed through.

On or about March 14, 1917, that estimate and outline of plan was handed to Admiral Benson, who, after reading it, directed Capt. V. O. Chase, Capt. W. V. Pratt, and Capt. F. H. Schofield to examine it and draw up a more complete estimate and plan. I was never shown the results of their work, but was several times questioned by them as to certain features of my estimate, and Capt. Pratt told me that their decisions were practically the same that I had reached. Later I was told by Capt. Schofield that they had completed their estimate and plan and that it had received the approval of Admiral Benson, but that they had been unable to get departmental approval to go ahead with it.

Had the department approved that plan, or even authorized Admiral Benson to go ahead with the plan, which must have been presented about the time war was declared, the various parts of the Navy Department would have been informed as to what their missions were and could have proceeded to carry them out. Without such a plan no one knew what to do. The Bureau of Ordnance, not having any definite plan to provide guns and ammunition for, was forced to order them for all kinds of projects, whether or not such projects might be feasible in the war as it was necessary to wage it. The Bureau of Supplies and Accounts had no information on which to base their purchase of supplies and was forced to buy not what actually would be needed, but what they guessed they might possibly be called on for.

Digitized by Google

The Bureau of Navigation had no idea of what they should do as to providing personnel. Every bureau and every office was in a similar predicament. Such a plan was equally necessary to those at sea, for without it instructions could not be given them as to how to best direct their efforts. All of these faults would have at once disappeared had there been an approved plan on which the whole Navy could be concentrated.

I do not mean to infer that the Navy Department had no general plans whatsoever for war. As in all navies we had a more or less well-prepared plan for the conduct of a war along the ordinary lines where all classes of ships are free to operate. What we did not have and what we needed at that time, was a plan for waging war against an enemy that used only submarines. That such plans were not prepared long before is not remarkable, for until the Germans used their submarines as they did, no one conceived of such a war. However, at the time we entered the war, submarine warfare was an established fact, and its methods were sufficiently well known for us to lay plans to combat it.

Success in war and economy in war both demand a general plan. It requires the coordinated effort of the entire service along correct and well-defined lines to win a war. When there is no plan, it is impossible for those who supply material to tell what to get. When there is no plan each bureau becomes fearful that it may not have everything that will be called for, and it provides material not only in excess of the needs, but material that may not be needed at all. In this way vast sums can be wasted.

Because of the failure to get authority to carry out the plan submitted, and because there was no general plan for providing material and ships to meet the conditions then existing, each office and bureau of the department was forced to guess at many of the things it ought to do, and then each, without reference to any other office, go to the Secretary and ask for allotments from the emergency funds with which to do these things.

The allotments were frequently made, and resulting contracts for material were entered into without the Bureau of Supplies and Accounts having sufficient cognizance to know how the emergency fund stood. I know that one day, a month or two after the armistice was signed, Admiral McGowan, Chief of the Bureau of Supplies and Accounts, said to me:

> Do you remember the plan you tried to put through at the outbreak of the war that provided for handling the emergency fund, and which the Secretary wouldn't approve God, man, if he only had done it! The way things have gone, we find that after charging off everything we could to other appropriations, we have overexpended the emergency fund by about $165,000,000.

Later, by congressional action, money was transferred from other naval appropriations to cover the overexpenditures. I do not cite this to show that the money was wasted or lost, but merely to show that for the want of a definite plan for using funds that had been appropriated, it was not only impossible to provide exactly and only what was needed to carry on the war in the most efficient and economical manner, but also it was impossible to even tell how we stood on the money allowed us to carry it on.

Not having a definite general plan to work on, the operating part of the department was in quite as much of a quandary as the material

Digitized by Google

part. Instead of concentrating on a broad and clearly defined plan, the Navy began the war with merely a series of efforts exerted in several directions, and only coordinated as each effort received consideration in the same office, that of the Chief of Naval Operations. You can imagine the difficulties Admiral Benson was in under the circumstances. You can realize how impossible it was for him to send to Admiral Sims the antisubmarine craft that were wanted so badly on the other side.

You can see why for a long time he was unable to tell Admiral Sims what forces were ultimately to be sent to the war zone to overcome the submarines. Instead of having his original plan approved that he might put the machinery of our great Navy to work to carry it out and insure a successful conclusion in the least possible time, he was compelled to himself sink into details and get approval of first one and then another part of his plans. I was and am still amazed that the Navy was able to accomplish the remarkable work it did, but it is certain that what it did accomplish could have been accomplished much more quickly and much more efficiently than it was accomplished if we could have had a plan from the very start—a plan that was based on conditions as they were. Furthermore, I believe that had the Navy worked on that original plan, frequently modified to meet the changing conditions and new information, as all war plans must always be modified, we could have accomplished all that we did and much more in a very much shorter time and with a very much less expenditure of money. The above are my reasons for believing the fourth particular.

It should be clearly emphasized that subordinate officers in the Navy Department ought not to be criticized for any action they took that may have led to large expenditures. In the absence of plans from higher authority to guide them, it was their duty to do everything they could that in their individual opinion would help to win the war. They would have failed in their duty to the country if they had not assumed the responsibility and taken action to carry out the plans they themselves thought necessary, because of the absence of a general departmental plan.

Under the guidance of the Chief of Naval Operations the Navy's efforts did ultimately follow a correct and sound general plan, but I don't believe the full plan was actually ever laid down on paper or that under the necessity of having to get approval by piecemeal a general plan could have been laid down. Operations did what it could to establish a definite general plan at the time war was declared, but did not have the authority to order such a plan carried out. As nearly as I can recall, it was about the 1st of July, 1917, before any well-defined antisubmarine plan was approved. About that time the Secretary did approve the suggestions submitted by the "Board on devices and plans connected with submarine warfare" and instructed the bureaus to take steps to carry them out. That, I believe, was the first really definite plan the bureaus were given, but it was not until then, about three months after the war started, that the bureaus had even as much of a war plan to work to as that.

Passing on now to the fifth particular, it would be impossible to explain the situation I have just described without touching on a matter that I speak of only with great reluctance and hesitation. I

Digitized by Google

would not introduce it were it not essential to a clear understanding of the reasons why plans were not approved and why delays occurred in getting action on many important matters. But as the personal characteristics of executives often have profound effect on the organizations they direct, an understanding of those characteristics is essential to an understanding of the workings of that organization. In this case it was the personal characteristics of the Secretary of the Navy that often made it impossible to get approval of the really important policies. I found this myself, and many others found it. If more information is desired on this point I can give the names of such officers.

Whenever a plan or a policy was presented to the Secretary he almost invariably delayed action on it. The personal interest taken by him in all matters connected with the department absorbed so much of his time that he never had much left to give to us on the more important affairs. Therefore when we would present something important, even though it might be urgent, we could secure only a few minutes to discuss it. We would generally be directed to leave the paper with him for consideration. Now it is remarkable but true that papers left for "consideration" were for the most part not heard of again until the officer who presented the paper hunted it out. Frequently when it was followed up the paper could not be found. If it was found, there would usually be some reason for not approving it or of further delaying action. We always considered it much easier to get up a sound plan or policy than it was to get permission or authority to carry it out. It generally took longer to get approval, when we succeeded in getting it at all, than it did to formulate the plan or policy. This condition finally became so bad that officers used every means possible to put their plans and policies through without obtaining the required authority.

My own difficulties in this respect were probably greater than those of officers who had only to get approval of plans or policies, for not only did I have papers of that kind to present but also, being in charge of the officer personnel division, I had to prepare the vast number of orders to officers, commissions, etc., that the Secretary by law or by his orders had to sign. I mention this only to show you that my duties necessarily afforded me excellent opportunities of becoming familiar with the subject I am now discussing.

As you no doubt know, the Bureau of Navigation is responsible for the personnel of the Navy. The mission of the bureau is to obtain, train, and distribute personnel. Early in the war the bureau realized that it could rarely obtain approval of its plans for performing its mission in the war and from that time on the bureau was forced to assume much more authority in those matters than actually belonged to it. In spite of failure to get plans for obtaining men approved and even in spite of repeated orders not to take men into the reserves, Admiral Palmer directed that they be taken in and we took them in. Capt. Palmer himself can give you further information on this point. When it came to plans for training men, approval was equally hard to get. Capt. Palmer and Capt. E. L. Bennett can give you some interesting details of their difficulties in that line and of how frequently they went ahead and did things without having authority to do them. As for the distribution of personnel, the

Digitized by Google

Secretary of course rarely knew about the distribution except in the case of officers. But in the case of officers I met a most remarkable attitude in regard to sending officers not attached to ships abroad for duty in the war area. I made it one of the rules of the office that when Admiral Sims asked for officers he was to get them but I always had lots of trouble getting such orders signed. As a matter of fact not once but several times during the war the Secretary told me, and told the chief of bureau, too, that he didn't want any more officers sent abroad. Of course they had to go and we sent them by the simple process of assuming an authority we did not have and issuing the orders and passports ourselves.

Having above given you an insight into the difficulties of the officers in the department, I will now present some documents. The first document is one prepared by me on April 12, 1917, in an effort made at the request of Admiral Earle, Chief of Bureau of Ordnance, that "Operations" do something to help him get approval of contracts for the reserve 14-inch shells for our dreadnaughts and for the torpedoes for our new destroyers. The document was prepared by me and handed to Admiral Benson by Capt. McKean with a view to having the paper presented to the Secretary by Admiral Benson. It reads as follows:

[Confidential memorandum for the Secretary of the Navy.]

NAVY DEPARTMENT,
Washington, April 12, 1917.

1. I have to invite your attention to conditions so alarming to the safety of the country that in my opinion immediate steps must be taken to avert them. These conditions are reported by the Bureau of Ordnance's quarterly report, "Preparedness for War." These serious conditions are summarized as follows:

(1) Shortage of shells, 14-inch caliber.

(2) Nonaward of contracts for 1,296 torpedoes required by the 1917 building program.

2. As the Navy stands to-day we have the full allowance of 14-inch shell on the battleships in commission having that caliber guns. These are the (1) *Arizona*, (2) *Nevada*, (3) *New York*, (4) *Oklahoma*, (5) *Pennsylvania*, and (6) *Texas*. Should these ships be called into battle and expend their ordinary supply of shells—which is only sufficient for a short battle—we have not on hand to-day sufficient reserve 14-inch shell to refill their magazines. The total reserve supply of 14-inch shells for refill is but 1,861, an average of less than 31 shells per gun. Furthermore, if this small reserve is used for refills there would be no shells at all available for the *Idaho*, *Mississippi*, and *New Mexico*, now well along to completion. I can not bring too strongly to your attention that without shells for the guns battleships and all they contain are worthless. They not only can not defend themselves but can not even fight to save the country. To be without sufficient shells for our largest and best battleships exposes not only the Navy but the whole country to disaster. I most earnestly urge that the Chief of the Bureau of Ordnance be given authority and orders to provide sufficient 14-inch shell at the earliest possible time to fill out the allowance for the ships built and building and to complete the reserve stocks essential for those ships.

3. While the situation as to 14-inch shell is dangerous, that with reference to torpedoes is none the less so. Our new submarines, Nos. 78 to 107, and destroyers, Nos. 75 to 94, are all being speeded to completion and will undoubtedly be required for service as soon as ready. Neither can be used unless they are equipped with the torpedoes they were built to use. Unless the contracts for their torpedoes are entered into at once the ships will be ready before their torpedoes are.

The price for the 1,296 torpedoes involved, which has been the cause of the delay in executing the contracts, has been adjusted and the contracts have been signed by the E. W. Bliss Co. The price having now been satisfactorily arranged, it only remains to sign these contracts to start the work. It is earnestly recommended that the contracts be signed at once and the Bureau of Ordnance directed to have the work pushed to completion.

Digitized by Google

For some weeks before the declaration of war Admiral Earle had made every effort to get those contracts approved, but for some reason he had been unable to do so. You can imagine the situation in the Bureau of Ordnance to find itself unable to place contracts for shells that might be needed at any moment. With the Nation at war those shells for our dreadnaughts and the torpedoes for our new destroyers were essential, and Admiral Earle had been urging their purchase for weeks but without result. On or about April 28 the paper was handed back to me to find out from the Bureau of Ordnance if there was any change in the situation. I found the contract for torpedoes had been placed, but was informed that on that date the order for shells was still unplaced.

During the early stages of the war those of us working on problems concerning material saw that with skilled men leaving important war industries to enlist for the war we might become seriously handicapped in getting material for war purposes. At that time a number of firms wrote to the department begging us to take action that would prevent too great disruption of their plans through their men leaving them, especially at the solicitation of the Army which was seeking skilled mechanics and was making a great campaign for them without any consideration at that time as to whether or not the men were more valuable in the private plants that were supplying war material than in the Army.

One of the earliest to bring this matter to the attention of the department was the Tropenas Converter Co., who, I believe, supplied machines for making munitions. It can be seen that such companies produce one of the fundamental requisites for war and that if their plans failed to supply munitions or the machines needed to make munitions we could not get the munitions. Realizing the necessity of getting this important matter settled before any serious disruption took place, on May 10, 1917, I prepared a departmental letter to the War Department giving a plan for handling it, which letter I will place in the record.

The letter was not signed, nor was any action taken for some time on this important matter. The original of this letter, with a further memorandum by me, was filed in the Operations file under No. 4488–359–15 and can no doubt be found there. At the same time I prepared a reply to the Tropenas Converter Co., which I will also place in the record.

(The letters submitted by Capt. Laning are here printed in full in the record as follows:)

(Penciled note: Submitted on May 10, 1917, but not signed. Original is on file No. 4488–359–15, together with a further memorandum prepared by me explaining this.)

SIR: The attached papers are forwarded to the War Department for consideration, and their return is requested.

The Navy Department is receiving daily a number of letters from private firms engaged in the manufacture of munitions essential to this department and to the allied countries, complaining of the fact that through the enlistment of their employees the carrying out of their contracts and the manufacture of munitions is being seriously interfered with. I have no doubt but that the War Department is having the same experience.

It is felt in this department that the situation is serious, especially in view of the fact that munitions are at this time even of more vital importance than men. It is noted in the selective draft system for raising the additional Army increments that

Digitized by Google

this feature will undoubtedly be covered, but in the forces that are recruited entirely from volunteers it will continue.

The forces relying on volunteer recruits are (1) the Navy, (2) the Marine Corps, (3) the Regular Army, and (4) the National Guard. Even when the selective draft measure is passed these four forces will continue their call for volunteers and the result will be to continue the present disastrous plan.

It is realized that to properly cover the situation and to permit every man to serve the country in the place he is best suited for will require an organization of the size and authority of an executive department which it will be difficult to provide, requires legislation, and which can not be put into effect in time to meet the immediate and pressing situation. I am of the opinion that the situation can be fairly well met by coordination by the War and Navy Departments along the lines suggested in the attached correspondence. By this plan all Army, Navy, Marine Corps, and National Guard recruiting officers will become cognizant of the names of firms in their vicinity engaged in making munitions for either department, and with that information will be able to advise applicants employed by those firms not to enlist but to remain at the work where they will be rendering the best service to the country. At the same time the plan provides for placarding the munition plants with authoritative information to the men employed therein that by remaining at their work they will serve the national interests.

While the plan outlined above will not insure the complete immunity of munition plants from loss by the volunteering of their essential employees, it is believed that it will so materially reduce it as to make the loss negligible. It is comparatively simple to put in operation and its effect will be of vital good to the Government.

Hoping the War Department will see its way clear to cooperate with the Navy Department in putting the plan into effect, I am,

Very sincerely, yours,

———— ————.

The SECRETARY OF WAR,
Washington, D. C.

[Inclosure.]

NAVY DEPARTMENT,
Washington, May 8.

DEAR SIR: Receipt is acknowledged of your letter of May 4, 1917, concerning the loss of services to your contracting plant, R. S. Newbold & Son Co., by their men enlisting in the services.

The Navy Department recognizes the difficulty of the situation and agrees that men at work supplying machines can render no better service than to remain at their work at this time. Having this view, the Navy Department is endeavoring to put into effect a plan to discourage such men from leaving that work to enlist, and when completed I have no doubt but that R. S. Newbold & Son Co. will be included in its provisions. In the meantime it is hoped that your losses through enlistments will in no way interfere with the output.

Sincerely, yours,

———— ————, *Secretary of the Navy.*

Mr. G. MUNTZ,
Vice President Tropenas Converter Co., Brooklyn, N. Y.

The CHAIRMAN. You prepared these letters for the Secretary to sign?

Capt. LANING. Yes, sir. These particular letters I am handing you now, the originals were approved by Admiral Benson, but they were not approved by the Secretary.

Later, on June 1, 1917, this same question of the loss of skilled men from munitions plants was still before us, at that time coming up in a different way in connection with the operation of the draft law, and when we again tried to get the matter before the War Department in a way that would at least cover individual plants we were still unable to get any action. I will insert the letter in the record.

(The letter submitted by Capt. Laning is here printed in full in the record, as follows:)

Digitized by Google

NAVY DEPARTMENT,
Washington.

From: The Secretary of the Navy.
To: The Secretary of War.
Subject: John T. Lewis & Bros. Co. request advice on the subject of conscription of their employees.

In view of the importance to the Navy Department of the material referred to, the attached correspondence is forwarded to the War Department with the request that steps be taken to exempt men listed from conscription under the terms of the selective draft law.

JOSEPHUS DANIELS.

NOTE.—After signing the original the Secretary of the Navy scratched over the face of it with a pen.

Original contains penciled memo made by me at the time, as follows: "All this to be taken up after June 5."

HARRIS LANING.

Capt. LANING. Failure to get approval of these letters caused great delay in getting an agreement with the War Department in the very vital question of holding skilled men for the work in munition plants.

Those who were formulating the Navy's plans for the war found, in the earliest stages, that appropriations made for specific purposes did not give us our money resources in such a way as to enable us to use them to the best advantage in carrying on the war. War plans constantly change, and money to provide material to carry on war should not usually be appropriated for specific purposes. In order to avoid the previous errors and to enable us to go on with plans without any further delay after obtaining approval, on May 2, 1917, I prepared for departmental signature a letter which was approved by Admiral Benson and submitted for signature. This letter reads as follows:

NAVY DEPARTMENT,
Washington.

MY DEAR MR. SPEAKER: I have to invite your attention to a serious oversight in that portion that refers to the Navy of House bill 3971, making appropriations to supply urgent deficiencies in the Naval and Military Establishments on account of war expenses.

From the bill as reported to the House there is absolutely no provision made for increasing the Navy as to destroyers, submarine chasers, patrol boats, mine sweepers, mine planters, and the many other additional small craft that will surely be required for offensive and defensive purposes in this war. I believe this to be a most dangerous oversight, since the Navy has already entered contracts for these craft up to the limit of the present appropriations, and the additional craft and other material required to carry on the war can not be obtained because no funds are available.

It is utterly impossible to forecast what direction additional construction or operations will take, nor the exact kind of material they will call for. It is certain, however, that when the time for action comes, this department must be able to act immediately and on a large scale I therefore recommend that Congress be requested to provide a special naval emergency fund of $250,000,000, to be known as naval emergency fund No. 2, and to be available for expenditure in the discretion of the President to meet all needs of the Navy not otherwise provided for.

Unless this provision is made in the very near future, it may not be possible for the Navy to undertake those operations that may be essential to success in the war.

Sincerely, yours,

———— ————, *Secretary of the Navy.*

The SPEAKER, HOUSE OF REPRESENTATIVES.

The letter was not signed and was later returned to me for file. Had that letter been signed at that time it would probably have given us just what we needed in the way of money resources, and

Digitized by Google

what would have enabled the Navy Department to go on with the development and carrying out of plans for which there was no money then available.

Of all the matters on which action was delayed there is probably none that gave the aid for material more worry or longer worry than that of getting the dreadnoughts materially ready to fight. Before and after February 1, 1917, and even after April 6, when war was declared, the material condition of all our ships, and particularly our heavy ships, was repeatedly discussed and authority asked to get them ready to fight. But the authority to get the heavy ships ready was long coming. About the time war was declared announcement was made to the public that the Navy was entirely ready, but as late as May 18, 1917, we were still urging that the battleships be sent to yards to have work done that was essential to their fighting efficiency. I will now read a memorandum which I prepared and which Capt. McKean signed and Admiral Benson about May 18, 1917.

NAVY DEPARTMENT,
Washington, May 18, 1917.

Memorandum for Chief of Naval Operations.
Subject: Repairs to battleships, Divisions 5, 6, 7, and 8.

1. Attached hereto is correspondence on the subject of repairs to battleships of the divisions recently known as the active fleet, as follows:

(1) A letter from the commander in chief, setting forth in general terms the material condition of the ships referred to and pointing out the necessity of establishing a definite policy as to putting them in condition for any kind of service.

(2) Letters from each of the bureaus, Construction and Repair, Steam Engineering, and Ordnance, commenting on the above, indicating that the necessary work can be done, and each recommending that the essential work be done as soon as possible in order that the fleet may be ready for any service.

(3) Rough lists of the major items of repairs required on each ship.

2. It appears that the essential repairs to these battleships can be completed in approximately the following times:

Connecticut, 45 days; *South Carolina*, 20 days; *Michigan*, 15 days; *New York*, 35 days; *Texas*, 40 days; *Oklahoma*, at yard, June 9; *Delaware*, 20 days; *Florida*, 40 days; *Utah*, 50 days; *Arkansas*, 15 days (with turbines, 50 days); *Pennsylvania*, June 4 to June 30; *Wyoming*, 30 days; *Nevada*, 12 days; *Arizona*, new propellers, June 15, only few days; *North Dakota*, 35 days for fire control and over 4 months to install engines; ready January 1.

3. Based on recommendations of the Bureau of Construction and Repair, it is suggested that a schedule for repairing these ships be considered along the following lines:

Boston: Take *Utah* immediately, followed by *Delaware*, then *North Dakota* (total, 100 days).

New York: Take *Arkansas* and *New York*, immediately followed by *Texas*, then by *Wyoming*. *Arizona* to arrive middle of June for propellers (total, 105 days).

Philadelphia: Take *Connecticut*, *Michigan*, and *South Carolina* in order recommended by commander in chief (80 days).

Norfolk: Following *Oklahoma*, take *Pennsylvania* (already arranged for), then *Florida* (or *Florida* may be sent before *Pennsylvania* leaves if yard is ready); *Nevada* to go to yard when material is ready (total, 100 days).

4. By the above the fleet will be ready for anything about the middle of August.

MCKEAN.

With this memorandum and the papers referred to in it which were later sent to the files, where no doubt they can be found, Admiral Benson was finally able to get approval of a definite plan for the overhaul of the dreadnoughts. I do not know when the work on the ships actually started, but you can see for yourselves the length of time that was required to do the work of getting them ready when the work did start. Attached to the signed memorandum you will

Digitized by Google

find another memorandum and detailed lists of the larger items of work required on each ship. These I will insert in the record. [Reading:]

MEMORANDUM.

Attached hereto are lists showing the major items of work each battleship now operating with fleet that was unfinished when the ships left the yard to go to the winter maneuvers. The lists do not include any additional repair work that may have become necessary by the arduous winter maneuvers.

The lists show that practically all battleships require work that is essential to their fighting efficiency. The important work is mostly in the nature of the uncompleted alterations in the fire-control systems necessitated by the 1915 fire control board and the turret board. These changes make for better gun fire in action and therefore should be made if a way can be found to make them.

In addition we must also weigh the fact that the ships with the fleet have been out of dock about five months and that in the course of a few months more they will require docking if they are to be ready to make their speeds in case of war.

In view of the above it would appear that we must give careful consideration to the condition of the fleet and weigh its probable employment. The time must come in a few months when each ship will require docking and some overhaul.

U. S. S. "CONNECTICUT."

	Time to complete (days).
Steam Engineering:	
1. Install Levekin asst. cylinders	64
2. Install distant control valves to after dynamo stops	25
3. Modify training gear of 8 and 12 inch turrets to enable quicker shift to be made from fast to slow rate of train (work started). No estimate.	
Ordnance:	
1. Train guns of all 12 and 8 inch turrets; adjust to proper convergence, check sights with guns cross-connected and singly	25
2. Overhaul cross connecting gear of 12 and 8 inch turrets and install indicators to determine when oil motors are in neutral position (work was partly completed but indicators were not installed)	10
3. Install larger oil expansion boxed for oil motors, all turret guns	15
4. Substitute geared train in place of chain drive in limit switch of 12-inch hoists	25
Construction and Repair:	
1. Calk and make tight steel deck under and around No. 12, 7-inch gun foundation	4
2. Straighten and refit gun port shutters	20
3. Install voice tubes from upper deck radio station to after bridge	8
4. Install permanent nonmagnetic torpedo defense fire-control station in place of present wooden one	20
5. Improve sound-proofing of arc radio station	5

"SOUTH CAROLINA."

Hull Division:	
1. Rolling and inclining experiments	15
2. Stiffen deck under blowers in both engine rooms	4
3. Install steel protectors for sea charts	25
4. Install wind shields and umbrella tops on torpedo defense stations in foremast	4
5 Repair bituminous composition in fire-room bilges	15
Machinery Division:	
1. Rebalance armatures with fans in place	10
2. Roll out bottom brasses, starboard engine, repair leaks in water jacket	20
3. Renew three fire room traps	10
4. Remove all boiler safety valves to yard testing plant and adjust; determine if any repairs needed, if so make them	30
5. Install auxiliary lighting system	30
6. Purchase and install hydraulic speed gear for boat crane	30
7. Install auxiliary lighting system	30

Digitized by Google

"MICHIGAN."

	Time to complete (days).
Ordnance:	
1. Manufacture and install extension to 12-inch guns elevating control gear of each 12-inch gun (work started)	6
2. Change bag ejector at top of 12-inch auxiliary powder hoists so as to function without breaking powder bags	20
Steam Engineering:	
1. Overhaul counter-gear, etc. (work completed at yard, but not satisfactory)	14
Construction and Repair:	
1. Fit cast steel bolster outboard on each hawser pipe	5
2. Manufacture and install strong backs for shell bins	10
Steam Engineering (electrical):	
1. Necessary electrical work in connection with changes in voice tube systems, in accordance with 1915 board of fire control	3
2. Modify fire control salvo system, fire control board report (can be completed by ship's force).	
3. Install auxiliary lighting system	30
4. Mechanical distant control for search lights	12
5. Run feeder and connect up to panel for (1) 4,000 cubic foot blower	4
6. Install 1 1,000 foot ventilating blower	20
7. Remove and relocate rammer motor rheostats in Nos. 1, e, and 4 turrets	5
8. Number of small electrical items requiring from 2 to 10 days.	

"NEW YORK."

Construction and Repair:	
1. Calk leaky compartments (not double bottom)	15
2. Calk leaky seams and rivets in double bottoms	15
3. Renew two steel wire nets in mainmast	8
4. New sound proof radio booth	40
5. Weld steel plate protections around sea chests	16
6. Search light platforms	23
7. Rearrange present friction band steering gear, etc	25
Bureau of Ordnance:	
1. Ordnance work in connection with installation of two anti-aircraft guns	6
Steam Engineering (electrical):	
1. Provide and install director firing system complete	40
2. Provide and install ball bearings in all motors and remove, retap, and reinstall field coils	36
3. Provide and install return calls for fire-control voice tubes	15
4. Auxiliary lighting system, magazines, shell, and handling rooms	30
5. Turret salvo system alterations	30
6. Alterations in torpedo defense salvo signal system	15
7. Change fire-control telephone system to conform to plan for California class	30
8. Relocate searchlights	30
9. Fire-control telephones for antiaircraft guns	20
10. Rearrange radio room	10
11. Overhaul and modify battle radio system	15

"TEXAS."

Steam Engineering (electrical):	
1. Torpedo defense salvo signal system alterations. No estimate.	
2. Fire-control changes, turret and target bearing system	15
3. Fire-control changes, telephone system to conform to California class. No estimate.	
4. Relocate searchlights. No estimate.	
5. Provide and install return calls for certain fire-control voice tubes. No estimate.	
6. Auxiliary lighting in 14-inch magazine and shell rooms. No estimate.	
7. Provide and install wiring for plotting indicators in conning tower. No estimate.	
8. Provide and install fire-control telephone circuit, aircraft guns	20
Construction and Repair:	
1. Install stiffening in way of 22 VS WT door-operating gear brackets	9
2. Repair leaky seams, rivets, laps, etc., in double-bottom compartments	10
3. Renew gaskets on oval bunker doors	8

Digitized by Google

Construction and Repair—Continued.	Time to complete (days).
4. Rearrange Admiral and Chief of Staff quarters	20
5. Alterations of ventilation and coaling pipes, raise sprinkling pipes to permit stowage of original number of powder tanks	28
6. Windshields around torpedo defense stations	45
7. Umbrellas over torpedo-defense stations	20
8. Rearrange searchlight platforms	38
9. Torpedo-defense platforms	24
10. Rearrange present system and install additional fire-control voice tubes	60
11. Rearrange friction band of rudder to clear armor	25
12. Voice tubes to antiaircraft guns	25
13. Alter bucklers, No. 1 turret	13
14. Provide and install an upper-deck radio house	10
Steam Engineering:	
3 small items the material for which is to be sent to ship, and ship to do work.	

"OKLAHOMA."

Ordnance:	
1. Install directorscope, Mark IV, in turret	15
2. Ordnance work in connection with installation of 2 antiaircraft guns	10
3. Remove and reinstall torpedo air compressor, accumulator, and pipes due to omission of after torpedo room	15
4. Install clutch and lever for shifting rammer motor, turrets 2 and 4	20
5. Drain cocks on bottom of 20 pneumatic cylinder shell hoists, all turrets	6
6. Increase inside diameter of nose caps in shell carriers of shell hoists in all turrets	12
7. Remove rivets securing guides in upper end of shell hoist tubes and replace with countersunk head bolts in turrets 1 and 4	6
8. Install grease cups in clutch between elevating motors and speed gear in turrets 1 and 4	6
9. Make and install safety catch on rammer control levers in turrets 1 and 4	15
10. Fit heavier brass trays (24) to cars of powder hoists in turrets 1 and 4	15
11. Make oil tight metal oil seal covers on rammer friction disks in turret 1	6
12. Strengthen bearings of shell rollers abaft upper hoists in turrets 1 and 4	12
13. Make and install heavier counter springs to shell trays in turrets 2 and 3	4
Steam Engineering (electrical):	
1. Install light on each 2-gun turret adjacent to each sight scale	10
2. Relocate fire-control action cut-out switches in plotting rooms	No estimate.
3. Switch for ammunition hoist motors and two 2-gun turrets	10
4. Install additional cease-firing gongs for 5-inch guns, and cease-firing contact makers in both torpedo defense stations	15
5. Restore switchboards, forced-draft blowers, to original position	15
6. Complete director-firing system	3
7. Install smoke-telegraph system	25
8. Ventilating sets for auxiliary lighting systems, magazines and handling rooms	20
9. Install wiring and switch panels for operating anchor windlass motor from either forward or after generators	45
10. Call bells for voice tube from shaft alley to engine room	20
11. Install distant mechanically controlled high-power search lights	10
12. Electrical work for fitting up auxiliary radio room	15
13. Ventilating sets auxiliary lighting batteries	20
14. Electrical work in connection with replacement of forced draft blowers	15
15. Ship's service telephones	25
16. Wiring for plotting indicators in conning towers	10
17. Provide and install switches for various lights	25
18. Auxiliary lighting system in magazines	25
19. Install more efficient torpedo defense salvo buzzer system	No est.
20. Repairs to commutator bars forced-draft blowers	20
21. Overhaul, repair, and install one 5-kilowatt transformer radio set	10
22. Repair one armature for forced draft	10
23. Rewind one radio rotary gap motor	5
24. Properly install high-low power device	10

Digitized by Google

	Time to complete (days).
Steam Engineering:	
1. Install superheaters on 6 inboard boilers	100
2. Alter bottom blow overboard discharge piping in boilers as required in connection with the installation of 2-inch independent sea chests in each boiler compartment	10
3. Cross-connection pipe between the circulating pumps for distillers	15
4. Fit connections for and supply portable air gauges for furnaces and uptakes	20
5. Shields over oil return rings, outside of connecting rod forks for air engines.	15
6. Install system for cooling oil used for forcing lubrication of generators and generator turbines	15
7. Install exposed handwheels for operating gear for fuel oil cut-out valves	15
8. Steam hose and connections in each fire room	15
9. Install discharge line from dynamo condensor hotwell pumps to main feed tanks	20
10. Replace electrical forced draft blowers by Terry steam turbine blowers	30
11. Renew brick in boilers (3 unfinished)	14
12. Repair runner shaft and bearings main circulating pumps	15
Construction and Repair:	
There are 88 items on the Construction and Repair list requiring from 1 to 100 days. Largest item is structural changes following removal of after torpedo room	100

"DELAWARE."

Construction and Repair:	
1. Ash ejectors	30
2. Replace zinc protectors around sea chests with mild steel protectors	3
3. Install an approved design of gun spray operated from turret booth at each 12-inch gun	20
4. Renew top of fire control towers	20
Steam Engineering:	
1. Install motor type engine revolution telegraph. No estimate.	
2. Complete installation of heating and cooling coils in starboard and port forced lubrication oil tanks	8
3. Install 4 ash ejectors and 2 pumps in fire room	30
4. Complete auxiliary lighting system	9
5. Install 8 automatic contractor types controllers with master switches for controlling blowers in blower room	20
6. Modify solenoid operated antenna switch	7
7. Make changes to ship service telephones	28
Ordnance:	
1. Ordnance work in connection with manufacture and installation of power powder conveyance hoists	2

"FLORIDA."

Construction and Repair:	
1. Repair as necessary sections of sprinkling system and flushing fire main. No estimate.	
2. Overhaul and make water-tight all 5-inch gun port shutters	10
3. Examine and calk oil leaks in compartments C–3, C–4, etc	5
4. Renew asphalt formula where metal of hull is exposed in double bottoms, engine and fire room bilges	10
5. Overhaul steering transmission shafting and bearings	22
6. Overhaul coaling winch gear	25
7. Renew the inner and outer rings in fourth tier and the outer rings in fifth tier of mainmast	8
8. Remove wire nets in cage masts	17
9. Remove, repair, and replace 34 McCreery elbows	20
10. Repair by acetyline process outboard casting of ash ejector	6
11. Make changes in voice tubes	60
12. Wind shields and umbrella tops, torpedo defense stations, etc	45
13. Provide and install bulkheads fitted with water-tight door at frame 77, install shelving, etc	15
14. Replace zinc protectors around sea chests with mild steel protectors	4
15. Strengthen bulkheads in wake of main feed pumps	30
16. Install antiaircraft guns	30

Digitized by Google

Construction and Repair—Continued.	Time to complete (days).
17. Sound-proof bulkhead for radio room	8
18. Bridge radio station	15
19. Inclosure for Kolster meter	10
20. Build and install house on upper deck for radio station	25
21. Install approved design of gun spray at each 12-inch gun	30
Steam Engineering (electrical):	
1. Change searchlights and control platforms to conform to 1915 fire-control board report	60
2. Install mechanical control of searchlights	40
3. Change fire-control telephone system to conform to 1915 fire-control board report	40
4. Make changes in torpedo defense and turret salvo systems to confrom to 1915 fire-control board report	30
5. Change voice tube system to conform to 1915 fire-control board report	60
6. Make changes to voice tube call system to conform to 1915 fire-control board report	25
7. Install director firing system complete	30
8. Install auxiliary lighting system to fire and engine rooms, central station, etc	20
9. Install auxiliary lighting system in 12-inch magazines, shell rooms, and handling rooms	20
10. Install directorscopes, Mark IV, in turrets 2 and 3	15
11. Install approved design of gun spray at each 12-inch gun	30
12. Install 20-kilowatt arc transmitter, etc	30
Steam Engineering:	
1. Renew pitted and defective tubes, both main condensers	30
2. Repair 2 fuel-oil heaters	6
3. Cross connect steam lines in dynamo room	25
4. Install deck operating gear to cut-out valves main steam line	35

"UTAH."

Steam Engineering:	
1. Re-babbit as necessary, bearings, line shaft and main	4
2. Re-wood stern tube and strut bearings as required	15
3. Cover bare spots engine room bilges	30
4. Examine and test compartment C–99 for leaks and repair	20
5. Overhaul and calibrate, Cory shaft and revolution indicator system	20
6. Repairs to starboard feed heater	20
7. Reblade first two expansion H. P. C. turbine	50
8. Overhaul turbine throttle and automatic stop valves	25
9. Lift all turbine casings and rotors	60
10. Renew bent and broken flame plates in all boilers, line up and secure all in place	50
11. Turn off nozzles of ship joints in M. H. P. throttle valves and shrink on Monel metal sleeves	12
12. Strengthen bulkhead back of main feed pumps	30
13. Install lubricating oil settling tanks	40
14. Install operating gear from deck to 6 out valves of main steam line in fire rooms	35
15. Cross connect steam lines in dynamo rooms	25
Construction and Repair:	
1. Relag piping	20
2. Rewind armature No. 1 deck winch	15
3. Rewind 4 field coils of 35 horse power deck winch motors	8
4. Make change in voice tubes, etc	52
5. Construct torpedo defense stations, search light platform, etc	45
6. Replace zinc protectors around sea chests with mild-steel protectors	5
7. Strengthen bulkheads in wake of main feed pumps	30
8. Install foundations, platforms, etc., for three antiaircraft guns	30
9. Install trunks for main, auxiliary, and vertical antennæ leads	15
10. Install approved design of gun spray for each 12-inch gun	30
11. Rearrange bulkheads in connection with rearrangement of arc radio station and installation of Kelster motor	20

Digitized by Google

	Time to complete (days).
Ordnance:	
1. Overhaul cross-connecting gear, turret No. 5	15
2. Install springs and other parts to upper powder-hoist doors for each turret	8
3. Install modifications to periscope mounts in turret officer's booths (for each turret)	10
4. Install a device on shell hoists to prevent premature hoisting (for each hoist)	3
5. Install new clutches for elevating cross-connection gear of all turrets (for each)	5
6. Install directorscopes, Mark 4, in turrets (time per turret)	10
7. Install approved 12-inch gun spray (for each gun)	6
Steam Engineering (electrical):	
1. Submarine signal oscillator	26
2. Return calls from forward distributing room to both radio rooms	10
3. Install antennæ lead in 30-inch turrets, etc	30
4. Install gyro repeater compass in radio direction finder station	No estimate.
5. Overhaul and calibrate shaft revolution indicator system	25
6. Install auxiliary lighting system in 12-inch magazines, etc	20
7. Provide and install director firing system complete	20
8. Changes in voice tube call system	25
9. Changes in fire-control telephone system	40
10. Changes to torpedo defense and turret salvo system	30
11. Install auxiliary lighting system fire and engine rooms, etc	20
12. Provide and install turret auxiliary lighting system	30
13. Install mechanical control on 8 searchlights	40

"ARKANSAS."

Construction and Repair:	
1. Rearrange friction bands and tightening gear of rudder to clear armor	18
2. Pneumatic tube for delivery of radio messages	4
Steam Engineering (electrical): Auxiliary lighting systems in magazines, shell rooms, etc. (started)	10

NOTE.—No mention is made in report of turbine work required on *Arkansas*.

"PENNSYLVANIA."

Construction and Repair:	
1. Rearrange after torpedo room	90
2. Metal wind shield around torpedo-defense stations	45
3. Canopies over torpedo-defense stations	30
4. Provide and install stowage for antiaircraft ammunition	15
5. Install valves and protections on all pipes that pierce armored deck over steering-gear compartments	10
6. Stowage for 5-inch ammunition	10
7. Install 10-inch copper antenæ trunk	20
8. Ventilation for auxiliary lighting system, engine and fire rooms, etc	30
9. Stiffen near after keel knuckle	90
10. Install supports for tops 5-inch hoists	10
11. Strengthen decks under lower handling room	15
12. Change port bucklers No. 1 turret	20
13. Install voice tubes between turret chamber and upper powder handling room	No estimate.
14. Install voice tube from forward torpedo-defense station to barbette, etc	15
Steam Engineering (electrical):	
1. Install lighting system in magazines, etc	30
2. Provide and install smoke-indicator system	No estimate.
3. Shift electric leads to steering gear	40
4. Electric indicator system for steering telemotors	No estimate.
5. Auxiliary lighting circuits torpedo and steering engine room	No estimate.
6. Provide and install smoke indicator system	10
7. Install fire control circuits for antiaircraft guns	20
8. Complete installation of flagship battle radio	12
Steam engineering:	
1. Install separators in evaporator vapor lines, etc	25
2. Install distant control for steam stop valves fuel oil and booster pumps, fire room	No estimate.

Digitized by Google

Steam Engineering—Continued.	Time to complete (days).
3. Make connection from reserve feed tank suction pipe to main air pump suction	No estimate.
4. There are other alterations not essential to war efficiency	No estimate.

"WYOMING."

Construction and repair:	
1. Install stowage arrangements for antiaircraft ammunition	30
2. Rearrange present and install additional fire control voice tubes	28
3. Install extension to flying bridge, etc	18
4. Install metal wind shield to flying bridge	20
5. Rearrange present friction hand and tightening gear to rudder to clear armor	25
6. Replace zinc protectors around sea valves	38
Steam engineering:	
1. Rewood main circulating pump shafts	15
2. Furnish material repair and realign baffles of boilers	18
3. Furnish material for removal of evaporator leads 3 and 4	9
Steam engineering (electrical):	
1. Reinsulate commutators of 2 forced draft blowers	15
2. Return call bells for voice tubes	6
3. Auxiliary lighting system in magazines and shell rooms	30
4. Engine revolution telegraph system	20
5. Install six new turret power panels in flame-proof boxes	35
6. Install circuits for directorscope in main top	15
7. F. C. telephone circuits for antiaircraft guns	4
8. Install five sets power elevating central for director firing sprocket chain	30

"NEVADA."

Construction and repair:	
1. Overhaul anchor windless machinery (may not be required)	30
2. Recalk deck and stop leaks in steel shell, all weather decks	25
3. Overhaul and repair all 5-inch gun port shutters	15
4. Repair leaks in deck around both windlass foundations	15
5. Make decks around No. 1 turret water-tight	15
6. Complete the temporary installation of turret training control gears	10
7. Complete alterations in connection with after torpedo room	30
8. Remove rudder brake-band bracket and install new brackets	35
9. Install stiffening near after-keel knuckle	10
10. Additional storage for 14-inch shells	20
11. Alterations in steering gear clutch to shift from steam to electric steering	15
12. Install metallic stiff dressing table in sick bay	10
13. Modify fore and aft bulkhead in shell-handling room in turrets 1 and 4	20
14. Convert air locks in fireroom rooms into sound-proof booths and fit voice tubes for communication	20
15. Complete installation of ventilation system for charging station	10
16. Modify turret training control shafting	10
17. Provide and install 7 stationary type foam fire extinguishers	35
18. Close up openings in bulkheads in machinery spaces below third deck	20
19. Construct and complete metal radio house on bridge	15
20. Install valves in all pipes piercing deck over steering house	40
21. Wind shields around torpedo defense station	30
22. Provide and install metal house on boat deck	60
23. Ventilation for auxiliary lighting system	15
24. Voice tubes from engine rooms to shaft alley	20
25. Rearrange present and install additional f. c. voice tubes	50
Steam engineering:	
1. Install blinker signal lights on main yardarms with controllers on bridge	15
2. Make and install struts in water drums of all boilers	30
3. Alter baffling of boilers	30
4. Install Bowser oil meter	20
5. Replace electrical forced draft blowers by Terry steam blowers	30
6. Install smoke telegraph system	25
7. Install directorscope mark four in turrets	15
8. Remove and reinstall torpedo air compressors, accumulators, and air pipes	15

Digitized by Google

The second memorandum and the lists of work had been prepared by me some time before war was declared and were items essential to the fighting efficiency of the ships. It should be noted that the items were all known to be necessary at the very time the announcement was made that the Navy was ready, for they were only essential work that had been authorized and left unfinished when the ships left about January 1 to go to Cuba for winter maneuvers. I have no record of the additional repair work required on those ships as a result of their several months of operations in tropical waters.

There is perhaps no achievement of the Navy that has been as favorably commented on as its work in transporting troops across the ocean during the war. I will now point out how hard it was to get the Navy Department to take any action that would enable the Navy to get control of and operate the transports.

In connection with my duties in regard to Navy material, early in May, 1917, after carefully studying the situation, I prepared a memorandum on the subject of the Navy manning and handling the transports that would be utilized in carrying troops abroad. Unfortunately I did not save a copy of that memorandum. However, about May 24, 1917, no action having been taken on the matter and a letter having been received concerning the use of the *Vaterland* for transport duty, I took the occasion to prepare a department letter to the Secretary of the Treasury, who at that time had possession of the seized German ships, setting forth the necessity of having troop transports manned and operated by the Navy and requesting that 16 of the largest, fastest, and most suitable of the seized German ships be turned over to the Navy to be fitted out for that purpose. The letter followed closely the lines of the memorandum I had previously prepared. It reads as follows:

N. S. C. 65.
Mat-1-M. L. 5/25.

NAVY DEPARTMENT,
Washington, May 25.

SIR: I have to acknowledge the receipt of your letter of May 22, forwarding a copy of the letter from the collector of customs of New York, in which he recommends that the *Vaterland*, not being suitable for a cargo ship and being especially suitable for a transport, should not be intrusted to a merchant crew but should be under the command of an officer of the department that would operate her in the transportation of troops.

I most heartily concur in the collector's view and recommend that not only the *Vaterland*, but also such other of the seized German ships that are required for use as troop transports, be turned over to the Navy Department to be prepared, fitted out, manned, and operated by the Navy in that service.

In this connection I invite your attention to the necessity of the Navy operating all vessels used in the transport of troops during war, and especially of those vessels operating in waters where the enemy may be encountered. Unless such ships are manned and operated by the Navy the chances of their loss will be tremendously increased, and since their destruction will cause enormous loss of life and may jeopardize the campaign, we must take every possible step beforehand to reduce the chance of such loss to a minimum.

The first consideration in the transporting of troops is their safety. It must be remembered that while on troop ships the troops can not fight. A torpedo or even one lucky shot from a gun may sink a transport with practically all its precious freight of munitions and lives. It follows, then, that every plan for transporting troops must contain every possible safety precaution. The mere presence of a naval convoy is not in itself sufficient protection and especially so against submarine attack. The ships carrying troops must maneuver and operate defensively under command of the convoy commander.

Digitized by Google

It is evident that the haphazard gathering of ships to transport troops, with personnel untrained to maneuvers or even to communication with the leader of the force, is merely inviting colossal disaster. The country stands to lose all and gain nothing by such a method of handling troops. It may be justly likened to detailing an untrained industrial force to go into the fighting line on land. Such a plan would have no chance against a powerful and resourceful enemy. Even to a less extent would an industrial navy have any chance against the enemy's fighting navy, and to carry thousands of troops into the waters of the fighting front in industrial shipping, places them in the greatest possible danger.

While there are a multitude of details in connection with the transportation of troops, there are two points of vital importance to be considered in assigning transports. These are:

(1) The selection of vessels of suitable type, with sufficient capacity and speed.
(2) The personnel and operations of the vessels.

The selection of ships for transport service requires care. Ships suitable must have accommodations for a great number of men and cargo capacity for the equipment and supplies of the men carried. Speed enters into the selection for several reasons. First comes the question of safety, for the greater the speed the more immune is a ship from attack. Next comes the question of grouping the transports according to speed. If we mix ships of various speeds in one group of transports, the speed for all of the group at once becomes that of the slowest ship. If we put the *Vaterland*, with 24 knots' speed, in a group containing one ship of, say, 15 knots' speed, the *Vaterland* becomes for that trip a 15-knot ship and at once loses the value of her great speed. It follows, then, that in selecting and arranging ships for transport service, we must select ships of similar speeds for each group, and sufficient groups to carry out our task.

From a study of the possible requirements of our overseas operation it would seem that four groups of ships should be provided. If of sufficient speed, each group can make a round trip about once each month, and this would give us a constant and steady flow of troops and supplies to the front. After a careful study of the ships most suitable for the purpose the Navy Department is convinced that the best ships available are certain of the seized German ships. They were especially designed to carry troops and can be put in service in the shortest possible time. It is advisable to use them, since by so doing the regularly established shipping routes will be least interfered with. These ships are at once the best and most available for the purpose and of them those listed below will answer the immediate requirements. They are grouped as to speed and each group would form one unit of the transport service, probably as large a unit as could be safely convoyed with the submarine situation as it is. These groups are as follows, the estimated troop capacity being based on an allowance of 4 tons per man carried:

FIRST GROUP.

Ship.	Estimated troop capacity.	Speed.
		Knots.
Vaterland	10,000	24
Kronprinzessin Cecelie	3,000	23½
Kaiser Wilhelm II	3,000	23½
Uss Von Steuben	2,500	23

SECOND GROUP.

Ship.	Estimated troop capacity.	Speed.
		Knots.
George Washington	8,000	19
America	7,000	17½
Martha Washington	3,000	17

THIRD GROUP.

Hamburg	3,300	16
Grosser Kurfurst	4,000	15½
Konig Wilhelm II	3,000	15½
Princess Alice	3,300	15½
Princess Irene	3,300	15½

FOURTH GROUP.

Cincinnati	5,000	15
President Grant	6,000	14½
President Lincoln	6,000	14½
Frederick Der Grosse	3,300	14½

With a fleet of transports operating in groups as above we could handle about 70,000 men a month, with all their equipment except animals.

To handle these ships safely, they must have the personnel trained to operate in naval methods. This applies not only to the actual maneuvering of the ship but also to the specially trained men to man and operate the guns, the signalling outfit, and the radio outfit. Men untrained in naval methods can not operate any of these things, and yet on them depends the ships' safety.

Digitized by Google

Also we must not overlook the fact that each of these ships must be specially equipped with naval outfits of signal books, radio, etc. These things can not be entrusted to any but naval men. They are most secret and to allow them to pass into other hands endangers not alone the ships of the expedition but the whole Navy that uses them.

Again we must bear in mind that these ships carrying the most precious and essential part of our war forces must be entirely manned by men tried and true. The methods of signing up crews for merchant shipping if used in obtaining crews for vessels in our transport service leaves an open way for enemy agents or sympathizers to work into the crews of those vessels and they can carry out any nefarious design they might wish. We must man transports from captain to coal-passer with the most dependable men available, so that there may be the minimum danger from enemy agents.

From the above it is evident that there can be no division of authority on the ships engaged in carrying troops. If the Navy is to be responsible for the safety of the convoy after sailing it can not permit any but its own representatives, trained to the requirements of the duty, to operate any part of it. Even then, only by close coordination between every unit of the expedition can success be expected and with the utmost coordination the duty is fraught with danger. We can not permit added dangers by putting any phase of the troop transporation in the hands of untrained and unorganized assistants, or in the hands of anyone of whose loyalty and fidelity there can be doubt.

I therefore strongly urge that this matter be given careful attention and that not only the *Vaterland* but all the other vessels listed above as necessary for transport duty and that are not now assigned the Navy, be assigned to the Navy at once in order that they may be properly fitted and equipped for the work and manned and put in service as troop transports at the earliest possible time. As not only the safety of the expedition but also the success of our whole campaign in the war depends on this matter, it should be decided on now and not wait for terrible disaster to show us the error of adopting any other plan.

Sincerely, yours,

THE SECRETARY OF THE NAVY.

The honorable the SECRETARY OF THE TREASURY.

Four days later I prepared a letter to the Secretary of War asking the War Department's assistance toward getting the troop-transport service turned over to the Navy and the service established on a sound basis. This letter, which was returned to me some days later from Admiral Benson's office unsigned and marked "hold," reads as follows:

In reply address the Secretary of the Navy and refer to Mrr. 1–5/29.

NAVY DEPARTMENT, *Washington.*

(Penciled note:) "Hold."

Capt. MCKEAN.

SIR: There is forwarded herewith a copy of a letter I am this day sending the Secretary of the Treasury, suggesting that certain seized German ships be turned over to the Navy to be fitted out, manned, and operated by the Navy as troop transports.

While the Navy Department does not desire to change the arrangements already made with the War Department concerning the immediate transportation of troops across the Atlantic, it feels that the ultimate problem is so essentially naval, that it would be derelict in its duty if it did not point out what it believes to be the most practicable and safe method of carrying out its part of the general mission.

The Navy is concerned in transportation of troops only from the time they go on board the troop ships until they leave the ships, but during that time it is entirely responsible for the expedition. The points of embarkation and debarkation mark the beginning and end of the Navy's responsibility, and in view of that responsibility it recommends a well-planned and carefully organized service.

The Navy Department is of the opinion that the transportation of troops should interfere as little as possible with shipping now engaged in transporting supplies across the Atlantic, and to that end proposes that certain seized German ships, especially designed for use as transports in war, be fitted up for the purpose. The ships can not be used immediately, but when repaired, equipped, and properly manned will be the best ships possible for the work. The ships named in the letter will give excellent service and will probably handle the transport question fully, enabling this country to deliver in the neighborhood of 70,000 troops per month on the western front.

Digitized by Google

It is not proposed that all supplies for troops be sent on these transports, though they will, of course, carry all that their capacity permits. Munitions, animals, etc., will, as a general rule, be transported by merchant ships, while fresh trooops with their equipment will go forward on transports.

The reasons for the Navy handling this service are set forth in general terms in my letter to the Secretary of the Treasury, and in view of the necessity of at once establishing the service on the best possible basis I request that the War Department, if it concurs with the views set forth, assist in every possible way to establish the service as recommended at the earliest possible time.

Sincerely, yours,

SECRETARY OF THE NAVY.

The honorable the SECRETARY OF WAR.

As I said before, that letter was not signed and was returned to me marked "Hold."

Even as late as July 3, 1917, I was still hammering away the little I could to get the transports turned over to the Navy. This is evidenced by a memorandum submitted by me to the Chief of Naval Operations on July 3, 1917, and which I will place in the record:

N. S. O. 65. Mat-1-ML (7/3). "M."

NAVY DEPARTMENT,
Washington, July 3, 1917.

Memorandum.

Attached hereto is a copy of a letter addressed to the President by the chairman of the Shipping Board, in which it is requested that all seized ships not already turned over to the Navy be transferred to the Shipping Board.

It is noted from the letter that while the Shipping Board is apparently adverse to turning over to the Navy or Army any of the seized ships that are to be used as transports, they suggest that the President give the matter consideration and that a decision as to what branch of the Government shall operate troop ships should be reached only after the arguments of all concerned are heard.

It is further noted from the letter that the board states that there is abundant time to make this decision before the ships are ready to load. This statement would be true if a merchant ship were ready for use as a transport whenever she is ready to load, but such is not the case. A very considerable change must be made in merchant ships before they are suitable for transport use, and to delay making these changes will merely delay the readiness of the ships for the service. The decision should be made at the earliest possible time and the fitting-out work started.

From conversation with Shipping Board representatives it is understood that they agree that some of the German ships must be used as transports, but they are of the opinion that such ships should be officered, manned, and operated by the Shipping Board and taken by the Army on "time charter" whenever it becomes necessary to transport troops. They apparently fail to grasp the idea that if we are to transport a large number of troops to France it will require a special service of large fast ships, and that the ships engaged in that service will be worked to capacity and can not do any cargo carrying other than to bring such cargo from their ports of call in Europe as may be ready when the ship is about to return. Inasmuch as the transports can not engage in commercial work at all, it hardly seems proper that the board should insist that they be officered, manned, and operated by civilian complements.

To operate troop ships in the submarine danger zone with any but the best disciplined and most loyal crew available is merely inviting colossal disaster. The Shipping Board plans to officer and man its ships as all merchant ships are officered and manned. One has but to read the reports of the officers in charge of our armed guards to realize the absolute menace to any ship by employing that method, yet it is the Shipping Board's plan to apply it to ships carrying invaluable munitions and thousands of men on whom our success in war depends. Unless troop ships are manned and operated under trained and loyal men of the Navy the chances of their loss will be tremendously increased, and, since their destruction will cause enormous loss of life and may jeopardize the campaign, we must take every possible step beforehand to reduce the chance of such loss to a minimum.

The first consideration in the transporting of troops is their safety. It must be remembered that while on troop ships the troops can not fight. A torpedo or even one lucky shot from a gun may sink a transport with practically all its precious freight

Digitized by Google

of munition and lives. It follows, then, that every plan for transporting troops must contain every possible safety precaution. The mere presence of a naval convoy is not in itself sufficient protection to troop ships, especially against submarine attack. When attacked, the ships carrying troops must maneuver and operate defensively under the command of the convoy commander. It is evident that the haphazard gathering of ships to transport troops with personnel untrained to maneuvers, or even to communication with the leader of the force, is merely inviting colossal disaster. The country stands to lose all and gain nothing by such a method of handling troops. It may be just likened to detailing an untrained industrial force to go into the fighting line on land. Such a plan would have no chance against a powerful and resourceful enemy. Even to a less extent would an industrial navy have any chance against the enemy's fighting navy, and to carry thousands of troops into the waters of the fighting front in industrial shipping places them in the greatest possible danger.

While there are a multitude of details in connection with the transportation of troops, there are two points of vital importance to be considered in assigning transports. These are:

(1) The selection of vessels of suitable type with sufficient capacity and speed.

(2) The personnel and operation of the vessels.

The selection of ships for transport service required care. Ships suitable must have accommodations for a great number of men and cargo capacity for the equipment and supplies of the men carried. Speed enters into the selection for several reasons. First comes the question of safety, for the greater the speed the more immune is a ship from submarine attack. Next comes the question of grouping the transports according to speed. If we mix ships of various speeds in one group of transport, the speed for all of the group at once becomes that of the slowest ship. If we put the *Vaterland*, with 24 knots speed, in a group containing one ship of, say, 15 knots speed, the *Vaterland* becomes for that trip a 15-knot ship and at once loses the value of her great speed. It follows, then, that in selecting and arranging ships for transport service we must select ships of similar speeds for each group and sufficient groups to carry out our task.

From a study of the possible requirements of our oversea operation it would seem that four groups of ships should be provided. If of sufficient speed, each group can make a round trip about once each month and this would give us a constant and steady flow of troops and supplies to the front. After a careful study of the ships most suitable for the purpose, the Chief of Operations is convinced that the best ships available are certain of the seized German ships. They were especially designed to carry troops and can be put in service in the shortest possible time. It is advisable to use them, since by so doing the regularly established shipping routes will be least interfered with. These ships are at once the best and most available for the purpose, and of them those listed below will answer the immediate requirements. They are grouped as to speed and each group would form one unit of the transport service, probably as large a unit as could be safely convoyed with the submarine situation as it is. These groups are as follows, the estimated troop capacity being based on an allowance of 4 tons per man carried:

Groups.	Estimated troop capacity.	Speed.	Groups.	Estimated troop capacity.	Speed.
First group:		*Knots.*	Third group—Continued.		*Knots.*
Vaterland	10,000	24	Konig Wilhelm II	3,000	15.5
Kronprinzessin Cecelie	3,000	23½	Prinzess Alice	3,300	15.5
Kaiser Wilhelm II	3,000	23½	Princess Irene	3,300	15.5
Second group:			Fourth group:		
George Washington	8,000	19	Cincinnati	5,000	15
America	7,000	17.5	President Grant	6,000	14.5
Third group:			President Lincoln	6,000	14.5
Hamburg	3,300	16	Frederick Der Grosse	3,300	14.5
Grosser Kurfurst	4,600	15.5	Barbarossa	3,000	14

With a fleet of transports operating in groups as above we could handle about 70,000 men a month, with all their equipment except animals.

To handle these ships safely, they must have a personnel trained to operate in naval methods. This applies not only to the actual maneuvering of the ship but also to the specially trained men to man and operate the guns, the signalling outfit and the radio outfit. Men untrained in naval methods can not operate any of these things and yet on them depends the ship's safety.

Digitized by Google

Also we must not overlook the fact that each of these ships must be specially equipped with naval outfits of signal books, radio, etc. These things can not be intrusted to any but naval men. They are most secret and to allow them to pass into other hands endangers not alone the ships of the expedition but the whole Navy that uses them.

Again we must bear in mind that troop ships carrying the most precious and essential part of our war forces must be entirely manned by men tried and true. The methods of signing up crews for merchant shipping (which will be followed by ships operated by the Shipping Board) is used in obtaining crews for vessels in our transport service leaves an open way for enemy agents or sympathizers to work into the crews of these vessels and they can carry out any nefarious design they might wish. It is perfectly evident that we must man transports from captain to coal-passer with the most dependable men available, so that there may be the minimum danger from enemy agents. The most dependable men available and perhaps the only entirely dependable men we can get are those in the Navy.

If the Navy is to be responsible for the safety of the convoy after sailing it can not permit any but its own representatives, trained to the requirements of the duty, to operate any part of it. Even then, only by close coordination between every unit of the expedition can success be expected and with the utmost coordination the duty is fraught with danger. We can not permit added dangers by putting any phase of the troop transportation in the hands of untrained and unorganized assistants, or in the hands of anyone of whose loyalty and fidelity there can be any doubt.

This matter should be given careful attention and all the vessels listed above as necessary for transport duty, be assigned to the Navy at once in order that they may be properly fitted and equipped for the work and manned and put in service as troop transports at the earliest possible time. As not only the safety of the expeditions but also the success of our whole campaign in the war depends on this matter, the correct decision should be reached without waiting for terrible disaster to show us the error of adopting any other plan. The best service possible is none too good for taking our troops across the sea and that best service is the service of the Navy.

It is not contemplated to use these vessels as naval auxiliaries but only to take them under complete naval control during such time as they are employed in carrying troops for the Army. The Navy Department does not wish these ships to remain permanently in the Navy but to have them revert to the Shipping Board when the transportation of troops has been completed.

From the very start I felt that we would not get any departmental action on this very vital question as to who would man and operate the troop ships. During the month of May, 1917, in conversation with my brother-in-law, Col. John McAuley Palmer, United States Army, who was Gen. Pershing's Chief of Operations, this question came up and I explained the situation to him. As a result of this conversation, through the recommendation of Gen. Pershing and his staff, the War Department began to advocate the taking over and operation of the troop transport service by the Navy.

Under the circumstances it seems probable that had the Navy Department taken positive action when the matter was first brought up much time could have been saved and the Navy would have had those transports and would have been getting them ready fully one month before we finally did get them. It may be added that the transports first turned over about July 10, 1917, were with one exception the very ones suggested in the first memorandum.

Just as there was great delay in getting the transport service turned over to the Navy, so also there was great difficulty and delay in that other much talked of naval effort, viz: The destroyer program. The estimate drawn up at the beginning of the war called for many destroyers in addition to those provided for in the three-year building program. In the piece-meal method of developing a general plan an additional destroyer program was also called for. This was met in part by placing orders for destroyers to be paid for out of the first

Digitized by Google

emergency fund, but the fund was too small to provide anything like the required number. It was to provide for just such situations as this that caused me, on May 2, 1917, to prepare for the Secretary's signature the letter I inserted above addressed to the Speaker of the House, asking for an additional emergency fund of $250,000,000, which letter, as you will recall, although approved by Admiral Benson, was not signed by the Secretary.

Evidently no action along the line of getting more money for destroyers and other small craft had been taken up with Congress prior to June 22, 1917, for on that date Capt. Schofield, then in "Operations" came to me and told me that in spite of all efforts it had been impossible to get the Secretary to take up the matter of getting appropriations for additional destroyers. He said it was imperative to get action on this matter which was vital, and that in order to force action it had been decided to each day submit a memorandum prepared by an officer giving that officer's argument as to the necessity of providing the additional destroyers. Capt. Schofield then gave me a copy of his memo. which was to be submitted the next day and asked me to prepare the memo. for the following day. These memos. read as follows:

[Capt. Schofield's memoranda.]

NAVY DEPARTMENT,
Washington, June 21, 1917.

Success in the present war means success in combating submarines. This fact is so patent to everyone that we have grown accustomed to the idea without being properly stimulated by it.

No war can be won on defensive measures. The offense is the only known way of imposing our will on the will of the enemy.

To date, the most effective offensive against submarines is the destroyer offensive. As the submarines extend the area of their operations seaward the "chaser" type becomes less and less effective and the demands made upon the destroyers increase.

The number of destroyers now is wholly inadequate. They are working under heavy strain. Their material will deteriorate. Units will be lost. These conditions, the present and foreseen demands have lead the General Board, all of the officers of operations, and Vice Admiral Sims, to urge that every possible effort be made now, with facilities already obligated to the Navy, to build the maximum number of destroyers in the shortest possible time.

The above recommendation contemplates laying aside for the present the laying down of additional battleships, battle cruisers, and concentrating on the building of destroyers.

The cooperation of shipbuilders and the authority of Congress are essential. Delay may be fatal.

The following day I submitted this memorandum:

JUNE 22, 1917.

The country relies on the Navy to save the submarine situation and will rightly hold the Navy Department responsible for any failure to do so. It is possible, at comparatively small expense, to save the situation, but failing to save it not only will we pay the penalty in life and treasure but we will actually jeopardize the national existence. It follows that this department must leave no stone unturned to fulfill its duty to the people and the country.

Up to the present time practically every measure we and our Allies have taken against the submarine warfare has been defensive. We are allowing our enemy to continually increase the number of his submarines and enlarge his area of operations. It takes but an instant's thought to show that this policy plays directly into the enemy's hands and that unless we can reverse the condition he must surely succeed while we and our Allies suffer defeat.

Our present defensive measures are perhaps the most extravagant and wasteful, as well as the most futile that can be devised. We are not using every effort to destroy the increasing number of wolves feeding on our flock, but rather are adding

Digitized by Google

to our flock, at tremendous cost, that these wolves may feed the better. To continue this plan means more than military defeat—it means economic ruin for all the world except our enemies.

Because we have great wealth is no reason why we should allow it to be sunk in the sea, for, great as it is, it can not sustain the cost we are putting upon it. Congress and private enterprises, as well as our Allies, are spending billions for ships to feed these submarine wolves whereas a small part of those expenditures, if used to create offensive weapons, would destroy them. Shall we continue to spend billions and insure defeat or shall we spend millions wisely and insure success?

Two years' experience has developed but one type of vessel capable of coping with submarines and that is the destroyer type. It alone has the speed, offensive power, sea-keeping qualities, and other characteristics that the submarine can not overcome. Sufficient destroyers, suitably equipped, will drive the submarines down, and keep them down or destroy them. Should we not build every destroyer possible in the shortest time possible?

A thousand merchant ships built to be sunk will cost us life and untold treasure. A much less number if kept afloat will save the situation. It is the Navy's duty to keep them afloat and since to drive the submarines from the sea to keep the merchant ships afloat will cost infinitely less than to overfeed submarines on costly laden ships, shall the Navy fail in the hour of need by not providing the only known cure—destroyers?

HARRIS LANING.

These "memos" show how strongly we had to argue before we could get any action. I have no knowledge as to what other officers submitted "memos" nor how long after the "memo" method was started before action was finally taken. It is sufficient for me to show you what lengths we were put to to get action on vitally important matters and how such matters were delayed through the difficulties in getting action. That these difficulties made the Navy's task much harder is certain; what the resulting delays cost in lives and treasure no one can even guess.

That is all of my statement.

The CHAIRMAN. Capt. Laning, what was the feeling in the department after the German ambassador had been given his passports? Was there a general feeling that war was inevitable?

Capt. LANING. As I recollect it, he was given his passports about the 3d or 4th of February.

The CHAIRMAN. I think that is correct.

Capt. LANING. The general feeling at that time among the officers was that war was inevitable; yes.

The CHAIRMAN. And the general feeling among the officers of the department was that preparations should be made at once?

Capt. LANING. Yes.

The CHAIRMAN. Preparations for war?

Capt. LANING. Yes.

The CHAIRMAN. Can you give me any information as to the complement of officers and crews on the various battleships and destroyers in February, 1917?

Capt. LANING. On the battleships at that time we had what was known as the peace complement. That was about 85 per cent of what we then considered to be the war complement. Later we found that what we considered to be the war complement was entirely inadequate to meet the demands of war as it is waged to-day. The introduction of submarines and certain other craft made it necessary to have a great many more men for lookouts, and the fire-control system required many additional men; so that at the time we went into the war we had not what was then thought to be the

Digitized by Google

battle complement, but what we then called the peace complement, and what we then thought to be the battle complement was not what we now know to be the fighting complement of those larger ships.

Of the destroyers at that time I think the crews were 94 men each, but when they got over into the war zone they found that to combat submarines, particularly, the destroyers had to have something like 120 or 125 men.

Now, the figures I have given you, of course, were for the active fleet. Those were the ships that were actually operating. There were a number of ships that were not operating. A number of the large battleships were in reserve, and the armored cruisers were in reserve on the west coast. I think all but two were in reserve on the west coast. Of our destroyers we had approximately 30 manned with 94 men each and something like 25 that were manned with what we call reserve crews; that is, 50 per cent of their full complement.

The CHAIRMAN. Was any attempt made to bring them up to their full fighting complement?

Capt. LANING. No, sir; we did not have the men with whom to bring them up. The law at that time, I think, gave us about 67,000 men, and we were pretty well recruited up to that number, and at that time we had no way of increasing the number of men on the ships unless that law was changed.

The CHAIRMAN. Was any attempt made to enlist any more men?

Capt. LANING. Just at that time, Senator, I was dealing with matériel and operations, and I did not know much about the personnel situation, did not pay much attention to it from October, 1916, until July 16, 1917, when I went to the Bureau of Navigation, and I am not competent to give you all the figures for that period, or to tell you what they did as to personnel at that time. I know that when the war started we did not have enough men to man all our ships.

The CHAIRMAN. Was there any plan of any kind made by the department to increase the efficiency of the Navy as to preparedness between the 5th of February or the 3d of February, when the German ambassador was given his passports, and the time that war was declared?

Capt. LANING. Oh, undoubtedly there were a number of things done.

The CHAIRMAN. What were the general plans of the department?

Capt. LANING. There was not any big general plan that I ever heard of, but I am sure that each bureau went ahead and did a number of things that it could do to get ready, but I do not know what they were.

The CHAIRMAN. Do you know whether the Secretary had any particular plan of his own?

Capt. LANING. No, I do not. I do not think he had.

The CHAIRMAN. And there was no general plan given out to the different departments?

Capt. LANING. Oh, no sir, there was no general plan. There may have been some individual plans carried out, but there was no general plan at all.

The CHAIRMAN. Was any attempt made to put in commission the battleships that were in reserve?

Digitized by Google

Capt. LANING. As soon as they could get the men, of course, they tried to put them in commission; but that is a detail that did not come under my office at that time, Senator, and I am unable to answer.

The CHAIRMAN. Was any attempt made to get merchant vessels, that you know anything about?

Capt. LANING. No, sir.

The CHAIRMAN. For transporting either troops or supplies?

Capt. LANING. I heard of no attempt by the Navy to get any troop transports other than these that I have read to you. I initiated those myself. I do not know of any other efforts to get troop transports at that time. We did get some merchant ships for certain naval purposes at that time, but that was not until after war was declared, of course.

The CHAIRMAN. When were you transferred to the Bureau of Navigation?

Capt. LANING. July 16, 1917.

The CHAIRMAN. Can you state the condition of the ships of the Navy generally at that time as to matériel?

Capt. LANING. My recollection is that at that time we had started on the repairs to the large battleships. When I submitted that memorandum, about May 18, and took up the subject of repairs to battleships, a definite plan was established immediately after that, and that went on and was carried out during the summer of 1917.

As regards the destroyers, they were repaired as fast as they came North, and as soon as they were repaired a great many of them were sent to Europe, but that was an operating plan for handling those destroyers with which I am not familiar. In the first part of the war I dealt largely with matériel, practically entirely with matériel. There was not anything else.

The CHAIRMAN. Did you have anything to do with the personnel during the first few months of the war?

Capt. LANING. No, sir, not until July 16, 1917.

The CHAIRMAN. I think you have stated that on July 16 we had need of something more than 6,000 officers, and we actually had somewhere around 2,400.

Capt. LANING. We had 2,394 officers in the line of the Navy, that is, the combatant class of officers, on July 16, 1917, which was the date when I took charge of the officer personnel division in the Bureau of Navigation. The actual situation at that time called for about six or seven thousand trained officers, and we had gotten pretty desperate and had begun to take officers off of the dreadnoughts. When I arrived in the Bureau of Navigation they had already stripped the dreadnoughts down to 22 commissioned officers of the line, when the complement of those ships called for something like 37 or 39 commissioned line officers. Even by reducing those large ships in that way the shortage was still so great that I had to make plans for more officers, and that is entirely explained in my hearings before the House Naval Committee, which I have inserted here, where I told the plans that we had to formulate to get officers to carry on the war. It was a very desperate situation at that time. We were only able to put those plans into effect and carry them out because we felt that the battleships would not have to fight on less than three months' notice. We made our estimates for handling the officer personnel situation on the basis that the dreadnoughts would not have to fight;

Digitized by Google

that is, that the dreadnoughts that were on this side would not have to fight on less than three months' notice, and we based that on this, that if the German Navy came out and offered a general engagement while there was the possibility that they would not win, we always had to figure on the possibility that through some chance they might win, but we believed that if they did win in a general engagement with the British fleet, it would take them at least three months after that to get ready to fight against us, and that we would have at least three months in which to get our personnel ready; so that was the basis of our plan for handling the officer personnel situation on July 16, 1917.

The CHAIRMAN. When did the first volunteer officers begin to be used?

Capt. LANING. When did they begin to enter the Navy?

The CHAIRMAN. When did they begin to be used as officers after training?

Capt. LANING. Do you mean by that men who were not trained before?

The CHAIRMAN. Men who were not trained before.

Capt. LANING. I suppose you mean at sea?

The CHAIRMAN. And in connection with that, when was the training of volunteer officers first begun?

Capt. LANING. That was begun before I went into the Bureau of Navigation, because when I arrived there they already had one class of reserve officers at the Naval Academy undergoing a three months' course of intensive training. That was started before my time in the Bureau of Navigation, and that is something about which I can not answer, Senator.

The CHAIRMAN. You can answer as to when they first began to graduate from this training and to be used in the Navy.

Capt. LANING. I could not answer that without refreshing my memory. I think it was some time in September, 1917.

The CHAIRMAN. So that during the time between July 1 and September you were still going ahead with only about 2,300 officers when you needed 6,000 officers?

Capt. LANING. Yes. As a matter of fact you might say that the only really highly trained officers we had during the war were those 2,394. Of course, other officers took up the training in a remarkable way. Those reserve officers were of the very highest class, and the temporary officers were of a high class, but they were not experts in all branches of the naval service, even when the war ended, but they were mighty expert along certain lines on which they had been working during the war. Of course, when a big war like that starts, you naturally want enough officers and men to man all your ships. We did not have anything like enough at that time. Of course, we could not have had enough at that time unless we had had legislation some years before to provide for it.

The CHAIRMAN. What is the shortest amount of training that a civilian, who is not familiar with naval affairs, would need to have before he could be utilized in the Navy as an officer, in an emergency?

Capt. LANING. We did use them after about three months, that is, after they had had that intensive training at the Naval Academy in the reserve class. Then we started other classes at other places.

Digitized by Google

Almost everywhere where we had a station, we had a little training school for officers, and we would turn them out in about three months. We would send them out with the rudiments of a naval education, and put them to work; but of course, they were not all-around officers by any means. We put them on one single job and they would master that, and as soon as they had mastered that they would begin to study another; and they gradually took up one thing and another at sea, and developed into right excellent officers.

The CHAIRMAN. So that, if early in February an attempt had been made to train civilians as officers, you might have had some of those men ready to take part by the 1st of May?

Capt. LANING. Yes, we could have had some of them ready to use them to very excellent advantage, as we did use them later.

The CHAIRMAN. But that was not done?

Capt. LANING. No, sir; that was not done around February at all.

The CHAIRMAN. The war began early in April. At what period should you say that the fleet was ready as regards matériel and personnel, to have engaged in a battle with the German fleet if it had escaped through the blockade?

Capt. LANING. With regard to matériel I think it was ready about the 1st of September. With regard to personnel, it was not ready until about the end of the war. You see, the battleships were used very largely for training purposes. We trained officers on them and we trained men on them, but it was a long time before we had enough permanently in what we called the active fleet, battleship force, to use its official title, before we had enough permanently in the personnel for them to be actually ready for battle. Of course, the ships that were sent to Europe were ready, I think, before the others were. I could not say just when the fleet was actually ready. You would have to ask the commander in chief that, sir—that is, in regard to personnel. In regard to matériel it was not ready until the late summer.

The CHAIRMAN. You say that the department probably had some plan at the beginning of the war. You can not tell me what that plan was, or what was the initial step to be taken in it?

Capt. LANING. No, sir; I have not seen that plan, but it is always customary to have a more or less well-drawn up plan to meet any emergency.

The CHAIRMAN. You do not mean in connection with this particular war, but you mean in connection with any war, the plan would be ready?

Capt. LANING. Yes; in connection with any war that might come up; but whether they had such a plan or not, I do not know positively.

The CHAIRMAN. And you do not know that there was any such plan for this war ready before war was declared?

Capt. LANING. For the war with Germany?

The CHAIRMAN. Yes.

Capt. LANING. No; I do not think there was any plan that would meet the submarine situation as it was then.

The CHAIRMAN. What was there to meet other situations that might come up?

Capt. LANING. Well, there is a general outline of a plan that might have been used in a war with Germany if she had been fighting us alone.

Digitized by Google

The CHAIRMAN. When was that plan outlined?

Capt. LANING. That I do not know, sir. That would probably be handled by the General Board, and did not come under our office.

The CHAIRMAN. Was it in existence some time before April, 1917?

Capt. LANING. I think it must have been. I think there must have been a plan before that.

The CHAIRMAN. But you are not familiar with the details of it?

Capt. LANING. No, sir; there was not any plan for carrying on a war along the lines that we actually had to carry this one on. I am sure of that.

The CHAIRMAN. In his annual report for 1918 the Secretary of the Navy says:

Before the President went before Congress on the 2d day of April, 1917, and delivered his epoch-making message, which stirred the hearts of all patriots, and in the climax said, "America is privileged to spend her blood and her might for the principles that gave her birth and happiness and the peace which she has treasured; God helping her, she can do no other," the Navy from stem to stern had been made ready to the fullest extent possible for any eventuality. More than a year before war was declared the President approved the three-year program of increase in the Navy, a radical departure from the long-accepted custom of making yearly authorizations for naval construction, and Congress gave the authority and appropriation for this new policy and large expansion. From that day to this hour, with appreciation of its pressing needs and with large vision of the future development of the Navy, the Congress has given everything that could be desired to insure effectiveness to the naval arm. It has done this after thorough study and full investigation, not only of the necessity of providing the required personnel and material, but also after the most searching investigation of the administration of the Naval Establishment.

Would you say that that statement was borne out by the facts?

Capt. LANING. No, sir; I do not think the Navy was ready from stem to stern when war was declared. I know it was not ready as to matériel or personnel, and those are the things that make up the Navy.

The CHAIRMAN. Do you think it was possible for the Secretary of the Navy to have done anything which he did not do, which could have reasonably been foreseen, either to prepare for war after it became imminent or to have hastened its successful termination?

Capt. LANING. Yes; I think there were many things that he could have done. When war became imminent, he could have insisted that we have a plan of procedure. We could have laid out those plans and could have been prepared to go before Congress immediately and state what was needed to carry out those plans. But we did not do that. We did not do anything.

The CHAIRMAN. One other matter that I omitted to ask you about: Do you know anything about the conditions of our submarines at the commencement of the war?

Capt. LANING. No, sir. While I was in the office of Matériel and Operations, I did not handle the submarines and I am not familiar with their condition.

The CHAIRMAN. Gentlemen, have you any questions which you desire to ask?

Senator KEYES. No.

Senator BALL. No.

Senator TRAMMELL. Capt. Laning, you speak of not being prepared in matériel and personnel. Was the Navy built up to the limit in personnel as far as authorized by law?

Capt. LANING. Approximately; yes.

Digitized by Google

Senator TRAMMELL. Then the Navy Department was exercising its full authority, and to its full limit, as far as authorized by law in regard to personnel?

Capt. LANING. Yes; it had all it could get.

Senator TRAMMELL. Whose neglect was it that you were not equipped as far as the law authorized you in matériel?

Capt. LANING. That was due to the fact that we did not have the funds to provide all the matériel that was essential. That is, on battleships, for instance, we are always developing new things in the way of fire control—that is, the control of the firing of the guns—and frequently those things were not put in because we did not have the funds available to put them in.

Senator TRAMMELL. The Navy Department was doing the best it could then, as far as matériel was concerned, considering the available funds?

Capt. LANING. Oh, yes; there is not any question about that; but the point I made was that it had not presented the facts to Congress so as to get the funds that it ought to have had to do those things.

Senator TRAMMELL. Do you know whether or not Congress would have approved of it if they had requested it prior to our entrance into the war?

Capt. LANING. Well, yes; I think Congress would have, because they wanted at that time to be sure that we were ready. At least it ought to have been put up to Congress. That is the way I think.

Senator TRAMMELL. After all, that was a matter of conjecture on your part, as to what Congress would have done?

Capt. LANING. Yes.

Senator TRAMMELL. As a matter of fact, Congress had not authorized any greater personnel or any greater expenditure for equipment than you were operating under at that time?

Capt. LANING. No, sir; it had not.

Senator TRAMMELL. Now, between February and April 6, the day upon which war was declared, did Congress pass any law authorizing an enlargement of the Navy?

Capt. LANING. On March 3 it passed the regular annual appropriation bill, and in that bill it made all of the funds appropriated immediately available, and made a particular appropriation of $115,000,000 for an emergency fund to be spent at the discretion of the President in preparing things that were needed by the Navy. I do not remember the exact wording of the bill, but it had that emergency fund in it.

Senator TRAMMELL. On March 3, a little over a month prior to the declaration of war, somebody did bring about legislation making available the appropriations then in existence. Do you think that the Navy Department had anything to do with that?

Capt. LANING. I do not know. I can not answer that question. I do not know whether they did or not.

Senator TRAMMELL. You do not know whether that was done at the suggestion of the Navy or not?

Capt. LANING. No, sir; I do not.

Senator TRAMMELL. If that is true, then, Captain, you do not know whether the Navy Department was active prior to our entrance into the war, as far as getting appropriations and trying to make some preparations?

Digitized by Google

Capt. LANING. No, I do not know what it did about appropriations. The thing I brought up particularly about that time was the plan. They had no plan of using the appropriations and they had no way of knowing what appropriations to ask for, as they had no plans.

Senator TRAMMELL. You are more familiar with the proprieties, at least of the Navy, and probably of the Government, than myself; but would it have been proper for the Navy Department to outline and get out a war plan a month prior to the time we entered the war—a war plan for a war with Germany?

Capt. LANING. Yes. We ought to have had one. You do not talk about it, but you are always supposed to have plans for any emergencies that may arise.

Senator TRAMMELL. Now, I am not talking about the question of preparation in different departments, and different operations, etc. You stated that there was preparation being made by different departments. They were doing quite a good deal. But I am talking about a plan, just as though you were going into war with them, and have it circulated all through the Navy and advise the Navy, generally speaking, that these are our war plans for war with Germany or any other country? Would that have been proper?

Capt. LANING. Not to have spread it broadcast, Senator, no. But it was proper to have a war plan for use in an emergency. You do not tell the whole Navy about it, but you only tell those who are concerned in getting certain parts of it ready so that they may know how to carry on their results. You should have such a war plan and you should have it years before, if you can get it.

Senator TRAMMELL. Of course I realize the wisdom of that in a general way, but I mean a specific plan. You say there was no general plan, but I believe you did state that there was quite a good deal of activity in the Navy after the ambassador, for instance, had been given his papers.

Capt. LANING. Yes.

Senator TRAMMELL. There was something being done?

Capt. LANING. Yes.

Senator TRAMMELL. There was not total inactivity on the part of all the different branches of the Navy throughout those months?

Capt. LANING. No, sir; there was not total inactivity. I stated that in the memorandum.

Senator TRAMMELL. The neglect, then, if there was neglect, consists in the fact that the plan was not general, prior to our entrance into the war?

Capt. LANING. Well, that was the principal thing. That is the greatest defect, that there was not a general plan. No one knew what to do, and what anybody did do was rather on his own guess.

Senator TRAMMELL. You were connected with the Bureau of Navigation, were you, in 1918?

Capt. LANING. Yes, sir. I went there on July 16, 1917, and stayed there until the 31st of March, 1919.

Senator TRAMMELL. Do you recall having a letter brought to your attention by—I do not know whether it is Admiral Pratt or what his rank was at that time; anyway, I will say Admiral Pratt—by Admiral Pratt from Admiral Sims; a letter dated August 13, 1918, in which an officer by the name of Carter made more or less criticism in regard to the manning, I believe it was, of the destroyers abroad?

Digitized by Google

Capt. LANING. Yes, sir; I remember that letter. I think it was on the question of manning submarines, Senator. He had a letter in there the subject of which was "Set a Thief to Catch a Thief." Is that it?

Senator TRAMMELL. Yes, "Set a Thief to Catch a Thief." That seems to be the subject in the letter.

Capt. LANING. Yes, I remember it.

Senator TRAMMELL. Do you recall whether or not under the date of August 26, 1918, you wrote a letter to Admiral Sims in reply to Carter's letter?

Capt. LANING. Yes, I wrote a letter.

Senator TRAMMELL. Mr. Chairman, Capt. Laning admits that he wrote a letter to Admiral Sims on August 26, 1918, in reply to a complaint, it seems, by some officer by the name of Carter. The letter of Carter seems to have been entitled, "Set a Thief to Catch a Thief." I would like to present the letter of Capt. Laning. It just gives some of the Captain's views on August 26, 1918.

The CHAIRMAN. Capt. Laning's views?

Senator TRAMMELL. Yes; Capt. Laning's views.

The CHAIRMAN. Will you read the letter?

Senator TRAMMELL. It is a pretty long letter. I will read it, though. [Reading:]

NAVY DEPARTMENT,
BUREAU OF NAVIGATION,
Washington, D. C., August 26, 1918.

DEAR ADMIRAL: Pratt called me in this morning and handed me your letter of August 13 with its inclosure, "Set a thief to catch a thief." We are always glad to have criticism of our work especially from you, and inasmuch as the criticism in this paper reflects on my office as well as on Operations it behooves me to sit up and take notice. While I am not a part of Operations and therefore do not formulate the working plans it is nevertheless my mission to distribute the officer personnel to carry those plans out. I lay no claim to genius in carrying out that mission, and I have no doubt made many mistakes, but they can not be laid to a lack of careful consideration of the problems I have been confronted with although Carter says that is the reason for his paper. On the contrary I have studied the plans and have made new estimates almost daily with the result that even after reading Carter's screed, I am not convinced that Operations has erred in its general plans or that my office has erred greatly in carrying out its mission under them.

I find myself criticized along similar lines by officers from every force and yet when those officers come to my office and had the general plans explained, they saw the thing in a new light. Whereas before they had seen the situation from the point of view of their own force, after an explanation of the general plan thay have altogether changed their minds. Undoubtedly we on this side have erred in not making the general plans more widely known to the service, but there are two reasons for not doing so, first, because it might not have been advisable to spread them broadcast; and, second, had it been advisable, the few of us who are in the jay bird seats over here haven't had the time to do it. It of course is not my province to disseminate that information for I am not the plan maker but I will endeavor to give you some idea of the line we are working on as a matter of justification both to Operations and the Bureau of Navigation. If, after my explanation, you feel that Carter is right and we are wrong, would you mind telling us where we have erred? If you will I promise you that the Bureau of Navigation will at once try to rectify, as well as it can, the mistakes it has made, and I am sure Operations will change the plans if they are unsound in principle.

To grasp the situation we must start from the beginning. When the war was declared we had commissioned in the Navy about 2,394 line officers. Of these about 350 (two classes) had just left the Naval Academy and could hardly be called experienced, but for the sake of argument let us accept it that we had 2,394 experienced officers of the line. Now, these officers were all and the only trained officers we have had to carry on the war. Everything else we have is green and untrained, or at least was. It was therefore necessary for those 2,394 officers to not only plan our part in the war

Digitized by Google

and carry out the operations, but also to provide and train all the other officers and men that might be required. It should be remembered that that number of officers was entirely inadequate to man the ships of the United States Navy as they then existed and much less adequate to meet the enormous expansion of activities that has taken place.

Senator TRAMMELL. It is all right, Mr. Chairman, to put the rest of letter in the testimony without reading it, if you are agreeable to that.

The CHAIRMAN. Are you familiar with the contents of this letter, Captain?

Capt. LANING. I remember writing it, but I do not remember everything that is in it; no, sir.

The CHAIRMAN. Would you care to have the letter read in full?

Capt. LANING. If you want to question me about it, I will be very glad to be questioned about it. I do not remember everything that is in it.

The CHAIRMAN. Then perhaps it would be well to complete the reading of it.

Senator TRAMMELL. Very well. [Continuing reading:]

It is evident that a decision had to be made, and made at once, as to what the Navy should do in the war. We could take our 2,394 officers and our 57,000 enlisted men, man what ships we could, and let it go at that, or we could use those officers and those men as a foundation on which to build a truly great Navy, one that could actually deal some blows to the Huns. It was evident that what we then had could not win the war, so that the second plan had to be adopted. We may have made our initial error at that time, and should have been content with a 57,000-man Navy, instead of the 400,000-man Navy we are rapidly coming to. Up to the present, however, we have no reason to think we have erred in adopting the plan of an expanding Navy. We took advantage of the enemy's inability to strike hard while we were building up our Navy for such a great war. The problem as it seems to us was not to deliver a puny and futile blow at the start, but to build for the blows that in the end must crush the enemy. To have wasted our strength to strike quickly when that strength was not sufficient to win would have been foolish. We would have sacrificed all, and in the end could have been only worse off than at the start.

Our mission was and is to decisively beat the enemy. If we accept some smaller mission we won't win the war. The first mission, subordinate to but a part of grand mission, was to defeat the U boats. Almost everyone assigned a task in that first mission immediately ran away with the idea that it was about the only mission we had. They were fortunate enough to get in the game, but once there they saw only their part in it. Even you yourself questioned the advisability of keeping our battleships in commission, and suggested putting them out to send the personnel over there. To have done that would have been disastrous, for those battleships have trained over 100,000 men and thousands of officers, which we would not have now, had we carried out the suggestion.

We recognize the importance of the work against the U boats, but we did not think that their extinction could alone win the war, nor that even by sending all our 2,394 officers over we could extinguish them. As early as July 1 last year it became known on this side that no matter how much we curtailed the U boats the war would be lost if we did not get troops to France. How were the troops to get there unless the Navy took them? The situation in our merchant marine was such that they simply could not carry out the task of transporting those troops, even assuming that their officers were sufficiently skilled in handling ships in convoys. The Navy not only had to convoy the troops across, but also it had to operate all the transports flying the United States flag. It at once became evident every cruiser we have would be a vital factor, and that transports were even more vital.

Suppose the transport service had not been developed early; where would we and our allies have been to-day? Just as the little force we put in against the "subs" swing the balance in our favor on the sea, so the transport and cruiser force later swing the balance on land to our side. Hasn't it turned out that making your force go and making the transport and cruiser force go were the allied salvation? We now operate over 40 troop transports and several hundred cargo transports. We could not have had either the officers or men to man them had we stripped this side for your side early in the war; yet without them could the enemy have been stopped on land?

Digitized by Google

Those troops of ours are saving the day, and I believe it would be unfair to put blame on the department for putting them across instead of sending the personnel to chase submarines. Both things were essential, but neither one by itself could save the day. By sacrificing something in our\U-boat efforts the transports have gotten across, but had we sacrificed the transports to sink U-boats our troops wouldn't have gotten over, and without them where would our allies be now?

Surely, we must concede that there were at least two important missions under our general mission, (1) the curbing of the U-boats and (2) the delivery of troops to France. Were these our only missions? I don't believe so, and certainly not after being privileged to read some of your own letters on the subject of battleships. Already we have been called on to send some battleships across, and I daresay all the other first-line ships will sooner or later be called on, perhaps not with the Grand Fleet, but for some other important duties in the war area. Will anyone question the advisability of our keeping those ships ready? Because they are not being used on the line to-day is not proof that they won't be called on to-morrow. Anyhow, we believe they must be ready, and surely in this you agree. This will account for our dreadnoughts; now, what about our older battleships? There is the rub. What are those old tubs doing? They are the groundwork of the whole scheme for a Navy big enough to win this war. Without them we would practically have no training place at sea for the hundreds of thousands of men and the thousands of officers required to man new battleships, new destroyers, transports, cargo ships, mine sweepers, submarines, subchasers, and the many other types of craft we are turning out in great numbers.

We have an average of 10 regulars on each of these ships, or 180 in all. Hidden away from all excitement and all chances of honor and renown, those fellows work harder than anyone and make possible the manning of our thousands of ships. Does young Carter mean that we should cut off our sole means of preparing personnel for the expansion to send more officers to the chasers? For the present we might get more U-boats, but in the long run we would do less to win the war. I believe that the missions of our battleship forces are an essentail part of the general mission and that neither of these subsidiary missions can logically be sacrificed to insure the better carrying out of another subsidiary mission. The missions are (3) (for dreadnoughts) to be instantly ready for battle, and (4) (for predreadnoughts) to train combatant officers and men to man the ever-expanding Navy.

I have so far covered our major operating forces, but have endeavored to show how the role each is playing is essential and one that can not be cast aside. We have other forces, of course, such as the submarine force, the district forces, etc. Of these only the submarine force has any regular officers, and then only in small numbers. The Caribbean patrol is made up almost entirely of reserve and Coast Guard officers. In fact, every force has only a leaven of regulars. The vast majority of officers attached permanently to any naval vessel on this side are newly made. On dreadnoughts on this side we now have a total of 14 regulars; on predreadnoughts, average, 10; on armored cruisers, 10; on first-class cruisers, 7; on smaller cruisers, 4; on gunboats, 3, etc. As new construction comes on the regulars will become fewer and fewer on each ship. Each regular is actively at work, each is engaged on the general plan, and each is doing what we believe will finally bring the total defeat of the enemy.

So far I have touched only officers afloat. There are a considerable number of regulars who, much to their disgust, are held on shore duty. It may be contended that these do not belong there, but if one looks into the situation even casually he would be amazed that we have gotten along with so few on that duty. As a matter of fact the feeling here is that because of the lack of officers for the handling of the shore end, that end is probably not succeeding as well as it should. Although every retired officer that can function has been called to active duty, and hundreds of reserve officers have been put in such positions ashore as they are competent to fill, the shore end is having a difficult time to carry on its work. We are spending billions of money for material the providing of which must be handled by experienced officers. We have 200,000 men in training alone on shore for which we must have some experienced officers. Great Lakes Training Station, with 47,000 men, has three regulars of the active list. Others are similarly curtailed. I could recite the details, and they would astonish you, but there is no use. I am sure you will believe me when I tell you that to-day regular officers are working to the limit of their endurance on shore, and their accomplishments would have been considered impossibilities 18 months ago. But the situation on shore is such that we are open to severe criticism because we have not sufficient officers to do the work as it should be done or to properly safeguard the expenditure of billions of dollars.

Digitized by Google

One of the big tasks that has fallen to the Navy is to man and operate the 2,000 merchant ships now being built by the Shipping Board. The supply of merchant officers and merchant sailors is exhausted, and the Navy alone has the facilities and organization to provide the personnel. While the cry that "ships will win the war" may not be correct, it is pretty certain that we can't win without them. And so the Navy will train and provide 20,000 officers and 200,000 men for these ships. It doesn't take many regulars to handle this task, but it takes some. Is their task such that they can be taken from it?

Perhaps it may be illuminating to tell you of our estimates of personnel which we presented to Congress recently. We figured that to merely man the permanent ships of the regular Navy on July 1, 1919, we would require 131,000 men, or counting men under training to fill vacancies caused by expiration of enlistment, men to cover casualties, and men for aviation (regular), 152,000. Of the latter figures we will not speak. The former, mind you, are needed to man only regular vessels; vessels temporarily in were not counted, such as transports, yachts, sweepers, "sub" chasers, cargo ships, coast-patrol craft, etc. To properly officer and run just the regular Navy ships would require 5,263 regular officers. But, in addition to that, we have to run other ships, where combatant officers are required, to the point of making the number of officers required about 8,600. To meet this we have now not 2,394 officers, but only about 2,370, so we can have regulars, where regulars ought to be, only in about one out of three places. You can see the veneer or leaven of regulars has to be spread pretty thin in every force. I have spread it just as thin as I have dared. I know each force would do a great deal better it it had more regulars, but I can't make them, and as each force has to operate, we give them all we can and count on them to get away with the job with the only tools we have.

We can't win the war with anything less than all our forces. We might throw battleships in the discard, but would you advise it? We can't throw our training ships (old battleships) out and continue to expand. We can't cut down our cruisers and transports without curtailing our troops movements. We can't cut down our shore end lest the sea end fails because of a shore-end failure. And so it goes all along the line. I have studied the situation—in fact, do nothing else but study it—and I can't see any way to send a larger proportion of trained men to the chasers over there than we are sending. I admit it would be well to do it if we could, but it can be done only by sacrificing something else. Looking at it in the broad light, what would you sacrifice?

Reading over Carter's article, do you believe he has my conception of the total effort of the United States Navy? He has written a very convincing article. His caption is good and his logic sounds plausible, provided his premises are correct. He makes a general estimate of the situation from the one point on the line that he sees, though general deduction from local and incomplete information are valueless. The great trouble with such arguments presented as his is, is that when spread around it weakens the morale. Over there you give us the devil because we don't do all you want us to do. You feel we are failing you. Does it help the morale over there or over here to do that? I know we, over here, are not in the limelight; that no matter how hard we work and how carefully we plan, there is no glory coming to those of us who are tied to the swivel chair. But please don't think we are quitting on the job. The Navy is paying the penalty of past shortsighted policy. That, we can not correct at once, but I am sure we strive now, have strived in the past, and will strive in the future, to meet your necessities as far as we can with the small personnel we have. We know your needs and meet them as far as we can, but we can't give you all you ought to have, for the officers simply don't exist.

I suppose we must suffer disagreeable criticism for not sending more officers of the regular service over there, but when you count those permanently there and those that go over and come back with the convoys and transports, I think you will find a very large per cent of regulars are quite actively engaged and that the small number who want to be similarly engaged but can't be that are on this side are doing just as vital work without whimper and without chance of reward. It is bad enough not to get a chance in this war, but to have our motives and efforts impugned by young officers who do not know of anything but the little part they can see is disheartening.

Let me point out where Carter is dead wrong. In his opening paragraphs he assumes that the most important work of the United States Navy is either one of two things, the defeat of the Germans on the sea or the defeat of the Germans undersea. With that premise and the use of false logic he proves his case. Both his premise and logic are wrong. The important work of the United States and its Allies is to beat the Huns. It doesn't make any difference where we beat them, just so we do. It may be on the sea, but it is much more likely to be on land. It is the Navy's business to use its efforts to beat them whether it be done on land or sea. If we can more cer-

Digitized by Google

tainly beat them on land, and it looks like that is where we must beat them, then our principal effort must be to help beat them on land. And after all, beating them on the sea is only secondary, for the final decision must be on land. We can win this war if we can beat them on land and can prevent them beating us on the sea, and it looks like our plan to that end will be successful. Carter fails to see this; fails to grasp what the Allies' general plan is, and therefore his whole idea is illogical.

But Carter is wrong elsewhere than in his assumptions. He apparently thinks the end of submarine warfare is the cure-all. Suppose we had done as Carter implies we should, stop everything that doesn't tend to curb the U-boats. Wouldn't the Allies be in a nice mess to-day if we had adopted that plan a year ago and forsaken our transportation of troops? Suppose we had kept up our troop arrangements and cast aside battleships, wouldn't "Fritz" have a better chance to win on the sea with our reserve fighting force irreparably out of business? The mere fact that even if he should lick the British Grand Fleet, there is another fleet ready to fill the gap must have had some effect on his plans, and anyhow if it didn't, it is a mighty good thing to have a strong reserve fleet against the slight possibility of his success. As a matter of fact, there simply isn't any cure-all. We have got to work along all our lines, doing each as best we can, keeping in mind that defeating the enemy on one line can not and will not by itself win the war in a reasonable time.

Coming down to cases, or brass tacks as Carter calls them, I admit we have not put the best men on hunting vessels. We have, however, put the best men there we could get. That we should have sacrificed our heavy battleships or our training ships to get these men, I don't agree; neither do the officers in Operations, and I don't believe you do. I know that many officers over there are of that opinion, but have they weighed the entire situation in coming to it? And is the calling of our battleships to the front the remote contingency Carter calls it? It does not seem so to us; in fact, quite the contrary.

Carter asks, "Does it require more brains and experience to handle convoys and escorts than it does to hunt submarines?" and then says that if the answer is "no," "there should be a new deal." Even if the answer were "no," it doesn't follow that there should be a new deal, because we must always consider the relation of the task to the general plan. Here is where his false premise looms up. You can't get this country to believe that the putting of troops into France is second to anything. But in my opinion the answer to his question is "yes." The biggest thing we are doing to-day is putting fighting men into France and our best brains must be concentrated on its successful accomplishments. I don't believe we would facilitate troop transport in the least by putting the brains now doing that work on hunting boats, do you?

I don't think 11 regular officers are enough for the hunting squadrons, but since they were all we could beg, borrow, or steal, sending that many was a "Hobson's choice." The Lord knows we wanted to send more, would have been only too glad to send them, but for the life of us we can't see the wisdom of stopping other Navy efforts to do it. But after all are those hunting officers so rotten as to be a scandal? They are not as good as regulars, but won't they, like the rest of us, get away with the job? We are chasing subs over here these days and the need is quite close at home, yet with it we still see no wisdom in changing our policy.

To read the blasé way Carter says that a goodly percentage of submarine officers should be taken from subs and put on chasers one might think we had a few hundred such kicking around loose. It shows how little he understands the situation. Our subs will soon have but one regular on board and even that many will be hard to provide. Subs, destroyers, chasers, cruisers, battleships, and everything are running on, but few regulars. No juggling can raise the number of them we have. If, as Carter says, submarine officers should be chosen from those in the war zone and sent to chasers, I am sure the bureau has no objection to your so assigning them. Of course we keep our hands off of reassignments over there, but has Carter's argument convinced you that it would be a wise move?

Carter says that the question comes up because it does not appear to be considered in the light of relative importance by those in authority. Appearances are often deceitful and have proved so in this case. As a matter of fact, we have probably studied the question more hours than Carter has minutes. If he thinks the swivel chair artists haven't sat up nights over the vital importance of swatting the "subs" he is very much mistaken. We have weighed the question both alone and in connection with the general plan, which I do not believe he has done, and our decisions have been reached on the broad basis of the general plan instead of on the narrow basis of a subsidiary plan.

As for the Eagle boats, we have not yet decided on their organization, for the simple reason that until they are tried out it isn't certain how they can best be organized. He jumps at the conclusion that the commanding officers won't be equal to the job,

Digitized by Google

because they did not graduate before 1914. If we carried out his ideas it would take 117 officers prior to the 1914 class just for commanding officers and division commanders of those boats, about 9 per cent of the officers below captain and above the 1914 class. As some 600 officers must come out of that same group for destroyers and the rest of the Navy must also be run to a large extent by them, I can't quite see how the supply can anywhere near meet the demand. This illustrates the futility of telling how to do things when one doesn't know the situation or ignores it merely to prove his case.

It is a good thing to act a thief to catch a thief, but if you haven't the thieves you can only put your best substitutes on the job, and that is what we are doing.

Carter's argument doesn't bother us much because it is based on incomplete information and false assumptions from which anyone who sees only his immediate task is unable to get a correct perspective. Your own short letter, however, in its first paragraph states as follows:

"When the history of this war comes to be written there will be a number of features that will not be very creditable to the United States Navy. If hearings are held on the conduct of the war, a number of rather disagreeable facts must inevitably be brought out. Without going into details I may say that as far as the Navy is concerned we will have fought this war with the bulk of our experienced personnel of the Navy on the side of the ocean where there is no war. We will have to be able to show that it was entirely necessary that we should have had to fight the war over here with a very large proportion of reserve officer who did not have the necessary experience."

And it is that paragraph that hurts. Are you sure that the bulk of our experienced personnel is on this side of the water now? Of course if you don't count the cruisers and transports you are right, but if you do count them as being engaged in active work you are wrong. Do you realize that ultimately two-fifths of our experienced personnel will be on destroyers alone and of the remaining three-fifth at least half will be over there before the war is over, provided of course transports and cruisers may be considered as working in the danger zone? The bulk may not be there to-day but we are expecting them to go and are planning for it. Please remember experienced officers number all told only about 2,370 and there is much for them to do over here that may be less spectacular and not deserving of credit, yet for all that it is work that without which the Hun can't be licked.

Please don't think for a minute that I alone can change the situation even if we have erred. It is not my province to determine operating plans. Such plans are not made in our bureau but it is our task to provide personnel to carry them out when they are made. We have endeavored to do that and at the same time have fought hard to get proper consideration for the personnel. We started with a handicap we havn't been able to work off. Criticism is easy, and just criticism beneficial, but there is nothing more lowering to the morale than unjust criticism, and criticism made without full knowledge and thought is apt to be unjust. I am not claiming that we don't deserve a lot of it, but that which comes from a paper like Carter's is not just.

I am sorry to have taken so much of your time and I will consider it a favor if you will come back at me and point out where we are wrong. I certainly hate to think that though I have to stay on this bum job I am also making a mess of it. I want to feel that even if there is no honor or glory in it that after all it wasn't so badly done. And don't lose sight of the fact that it is only by loyalty to the general plan and by the holding to it that decisions are gained.

Before closing there is one question I want to ask. In your opinion, when the entire Navy has an actual and vital part in the war, is it advisable to separate the bulk of experienced officers from the bulk of the naval forces, in order that some particular forces with particular missions should the better accomplish their missions, and in so doing disregard the fact that we actually interfere with the Navy's primary mission in the war? Carter's article is based on the answer yes to that question as are also the "disagreeable facts" that you tell us we must face.

With best wishes to you and all of your gang, one of which I long to be, because I believe I belong there, I am as always,

Sincerely yours,

HARRIS LANING.

Was that letter expressive of your views on August 26, 1918, upon the points that it touched upon?

Capt. LANING. Yes, sir.

Senator TRAMMELL. You have not changed your views in regard to the matters that you touched upon at that time?

Capt. LANING. No, sir.

Digitized by Google

The CHAIRMAN. I suggest, that if you have a copy of Mr. Carter's statement or letter, you produce that and let it be included in the record also, along with this.

Senator TRAMMELL. I have not a copy of that. We might see if we could get it.

The CHAIRMAN. Will you try to get it from the department?

Senator TRAMMELL. Yes; I will see if I can get it.

(The letter referred to is here printed in full in the record as follows:)

SET A THIEF TO CATCH A THIEF, OR WHY SUBMARINES ESCAPE.

What is the most important work of the war to be done by the United States Navy? Obviously it is not that of preparing to defeat the German High Seas Fleet it it should move out to contend for mastery of the surface of the sea. The British Grand Fleet has been pretty successfully attending to that for three years before our entry into the war.

If it isn't that, then it must be defeat of the German Undersea Fleet. If this defeat of the German Undersea Fleet (the U boats) be accepted as the most important work of the United States Navy, the only thing to be sure of is that we are going about it in the best available known way.

The way which we have adopted consists of building merchant ships to replace those sunk; convoying ships as much as possible by light craft, to prevent as far as possible the submarine from sinking them; hunting the submarine with light craft fitted with specially designed detection devices; and patrolling certain beats with a very small force of submarines, whose only weapon of destruction is the torpedo.

There can be no doubt that all of these elements should be employed, but there may be some short-sightedness as to which should be given the most thought. It is already realized that it would be folly to try to build ships faster than they could be sunk with enemy submarines roaming unhampered about the waters through which merchant shipping must pass. It has already been stated by competent judges, that the convoy system alone will not protect them. It has however, also been stated that an offensive which will destroy or drive the submarine from these waters is the answer to the problem. Such an offensive has already been inaugurated by assigning to the task, hunting vessels with specially designed detection devices and means of destruction. Nevertheless, until the personnel of the vessels assigned to the task are capable of solving the problem, the problem will continue to exist.

To give up talking in generalities and get down to brass tacks have we put the right men on the hunting vessels? We have not. The problem is one which requires the best brains and experience that can be obtained. Most of our regular officers are assigned to other vessels than those employed in hunting. The battleships in home waters have an average of eight regular officers below the rank of captain, and above that of the Naval Academy class of 1915. They have in addition many lieutenants and some lieutenant commanders, of the reserve force. If it is true that the British Grand Fleet can be expected to successfully deal with the German High Sea Fleet, then what would be the harm of using some of these officers in more important work, even if we had to go to the extent of stripping the battleships to the condition of the reserve battleships of four or five years ago? They would still have full crews of enlisted men and a sufficient number of officers to keep them in perfect condition as regards material and probably could hold considerable drill and training as well.

Is it more important to keep these ships with full complement of officers of them "standing by" for a condition which most all are morally certain will never exist, than it is to leave them in a perfect condition as regards material, and use their officers to make successful the hunting of enemy submarines?

Does it require more brains and experience to keep ships "standing by" for a remote contingency, than it does to prosecute an offensive against the wily and tricky submarine?

Does it require more brains and experience to handle convoys and escorts than it does to successfully hunt the wily and tricky submarine officered by the pick of the German Navy?

If the answers to any of these questions are no, then there should be a new deal, a reapportionment of the experienced regular officers.

Digitized by Google

On our battleships in home waters alone there is an average of eight regular officers of useful qualifications. In the entire Navy there are approximately 1,300 officers, junior to Captain, but senior to the Naval Academy class of 1915, and of that number there are but 11 now assigned to hunting vessels.

Is that a fair assignment?

Is the task before this hunting force of such little importance or of such ease of accomplishment that 11 regular experienced officers are sufficient?

The hunting vessels are being officered mainly by young inexperienced reserves; bright, keen, and willing men who it is believed will eventually learn the game and "deliver the goods." Undoubtedly they will eventually learn a lot about the game, but I believe that like the allied armies they will always be a lap behind the enemy. By the time they have learned what to do to cope with the submarine tactics of to-day it will be to-morrow and there will be new tactics by the submarines.

Our regular officers, on the other hand, can learn the game in much less time and then will have a fund of knowledge from past naval experience upon which to draw for initiating advances, change and amplifications of tactics against the submarine.

No matter how bright and keen the reserves are, is it to be expected that they can learn in a few minutes that which regular officers have acquired in from 4 to 20 years?

Many of these young reserve officers are men who were lawyers, bankers, and mercantile men with no technical training prior to entering the Navy. They are in charge of vessels fitted with mechancial devices of an extremely complicated nature, and if they learn them at all it can only be in a merely superficial way.

Is it to be expected that they can ever learn these devices as well as regular officers who have been brought up on mechanical "gadjets"?

Is it to be expected that officers who do not have the capabilities and eccentricities of the devices of their vessels at their finger tips, can handle their vessels in as efficient a manner as officers who do?

There will be times when certain devices will not be suitable, and certain others will be. For example—at certain times a submarine runs at a very slow, practically noiseless speed, or balances, or rests on the bottom, obviously a listening device will be of little value in detecting her. Here a magnetic, electrolytic device, or a sweep must be used and in using it, frequently the listening device must also be used to be sure the submarine has not started to run at an audible speed; or, it may be that depth charges judiciously used will start the submarine running away at an audible speed. In all these cases careful judgment resulting from naval experience will be needed to decide what to use and when and where to use it. It might be advisable to sweep or hunt along a re-tiring search curve. How many of our reserve officers are there who would realize that such a maneuver was the thing; and how many could do it after realizing it?

In connection with knowing the submarine's tactics, who would know more what to expect and who would be expected to size up a situation more quickly than a submarine officer? In other words, should there not be a liberal percentage of experienced submarine officers taken from submarines and put into hunting vessels?

Furthermore, should they not be the best submarine officers; that is, chosen from those who have had experience in the war zone?

This whole question of experienced officers for hunting vessel is brought up because it does not appear to be considered in the light of comparative importance by those having the authority to control it. Capt. R. H. Leigh has repeatedly emphasized the necessity of having experienced officers with the 110-foot chasers, but up to date there have been but two added. There are at Corfu four regular officers of the required experience, and one reserve officer of that experience. These 5 officers must be utilized on 1 tender, 36 chasers and a shore base.

Is it a sufficient number considering the importance of the task?

The Navy Department is about to assign officers to the first of the Eagles, 500-ton, 18-knot hunting vessels, and has cabled that they will be officered by four officers—a commanding officer not senior to the class of 1914 Naval Academy, an executive officer formerly a boatswain or gunner, an engineer formerly machinist or specially trained reserve, and a communication officer who will be a reserve officer. The department has also stated that no division commanders for these vessels are contemplated.

The commanding officer at the most will have had but four years' experience since graduating from the Naval Academy, and there will be no division commanders of any greater experience to guide them.

Would it not be better to assign to every group of six one commanding officer of considerably great experience, to act as division commander as well as commanding officer?

Digitized by Google

Would it not be still better to have more Eagles commanded by officers senior to 1914 and assign an independent division commander as well?

Is there so much other work of greater importance than hunting the submarine, that these officers can not be spared for hunting?

Has it not been due to a natural trend of thought inherited from the past that the importance of the work went with the size of the ship, and the curve of battleship, cruiser, destroyer, submarine, etc., followed right down to chasers, in the assignment of officers?

Is this a correct view of the importance of the work of the Navy in this war?

It is not meant that reserve officer should be replaced by regular officers, but rather that the regulars should be added and the reserves kept as well. The question of quarters for officers, which is bound to arise, need be given very little consideration. Take off some of the lower ratings of enlisted men and all hands fleet downward for quarters, etc.; junior officer take chief petty officers' quarters, etc. If necessary, the officers will steer, hoist signals, do electrical work, etc. An educated man can do this as well or better than an uneducated one, and when the emergency arises we then have his brains available. In most all exploration expeditions, etc., there have been a majority of scientific men who have roughed it (cooked, cut wood, slept on the ground, etc.), just as the guides, carriers, and others did. The Army officers are doing worse in the trenches now.

German submarines corresponding in size to those of ours which have three officers as a complement, carry five or six as their complement.

Is it not because they realize the advantage of many officers?

German submarines are manned by the most skillful and experienced officers it is possible to obtain.

Should we pit against them in hunting tactics our least skillful and experienced officers?

German submarines are manned by officers who have been trained in submarine shore schools, submarine school boats, and in war submarines.

Should we not pit against them as many similarly trained officers as possible?

"Set a thief to catch a thief!" Let's try that and set against the submarine many officers—the most skillful and experienced officers possible to obtain—and as many trained submarine officers as possible.

W. R. CARTER.

Captain, I just want to ask one or two more questions. One of the extracts from that letter is as follows:

I am not convinced that Operations has erred in its general plans, or that my office, Navigation, has erred greatly in carrying out its mission under them.

You stated that in your office in 1918. You still agree to that?

Capt. LANING. Yes, sir.

Senator TRAMMELL. I judge from that letter—I am not going to attempt to put in any more extracts from it—that you had a broad vision of the entire situation, Captain, and you considered that you did not only have to consider this side, and that you were looking at the situation with a vision covering not only the operations abroad, but in this country, in preparation, and everything of that kind?

Capt. LANING. Yes, sir.

Senator TRAMMELL. And that was the reason that you said that secondary devices, or "subsidiary devices," using your language, should not be made superior to the primary, main mission of carrying out the general plan?

Capt. LANING. Yes, sir.

Senator TRAMMELL. As far as you felt at that time the general plan of—I do not know whether you called it, you might call it—the Bureau of Navigation or Operation, you felt that it was being carried out upon proper lines?

Capt. LANING. At that time, yes, sir.

Senator TRAMMELL. Yes.

Capt. LANING. That was August, 1918; yes, sir.

Digitized by Google

Senator TRAMMELL. Well, in August, 1918. You were not connected with it until July, 1917, were you?

Capt. LANING. Connected with what?

Senator TRAMMELL. The Bureau of Navigation.

Capt. LANING. Yes; I reported there on July 16, 1917.

Senator TRAMMELL. That is what I say, July, 1917.

Capt. LANING. Yes.

Senator TRAMMELL. You seem to defend, in this letter, the policy of the department in the matter of the handling of the officers and the personnel, as to its plan of distribution, and so on, between this side and the other side; and as between the war zone and the transport zone. Was that policy at that time, when you wrote that letter in 1918, any different from what it was, say, 18 months prior to that time?

Capt. LANING. Yes, sir. Up to the time I went in Navigation, in July, 1917, we did not have any general plan, and we built up a general plan after that. That is, it was built up a part here and a part there until the Bureau of Navigation had a pretty definite idea of what its mission was, and we were carrying out that plan in 1918, doped on this piecemeal method. We were carrying that out when I wrote that letter to Admiral Sims.

Senator TRAMMELL. But even prior to the time that you became connected with the Bureau of Navigation there had been a little done, I believe. You said in your direct testimony that they had withdrawn certain officers from some of the dreadnoughts. They had done something of that kind, had they not?

Capt. LANING. Before July, 1917?

Senator TRAMMELL. Before you went in there.

Capt. LANING. Yes, sir.

Senator TRAMMELL. They were doing something, were they not, Captain, when you got into the bureau?

Capt. LANING. They certainly were. They were doing all they could.

Senator TRAMMELL. Prior to July, 1917?

Capt. LANING. Yes, sir.

Senator TRAMMELL. I do not question the efficiency of your service, and I think you no doubt rendered a splendid service, but I just wanted to find out if all these other officers were doing nothing up to the time you got into the Bureau of Navigation in July, 1917.

Capt. LANING. Did my testimony give you that idea? I did not intend it so.

Senator TRAMMELL. No; it did not; but you made a remark a while ago that after you got in they got everything all right.

Capt. LANING. No; I did not say they got it all right. I told you I spent some sleepless nights about that time.

Senator TRAMMELL. That was the substance of it; that they got things pretty well organized and going after you got in.

Capt. LANING. Well, it took a long time to do it.

Senator TRAMMELL. I know you did splendid work. I have the impression, though, that it is a fact that a very large percentage, nearly all, of these naval officers did fine work. I do not feel like one man did it all, and I do not feel like one man made all the mistakes. I believe officers are just about like everybody else; some of them

Digitized by Google

make some mistakes and some of them do some good work. I was rather impressed that most of them were doing pretty good work. That was just my casual observation.

Well, anyway, the department was at work on this problem, and you were connected with the bureau here?

Capt. LANING. On the problems of personnel.

Senator TRAMMELL. Yes.

Capt. LANING. Certainly; yes, sir.

Senator TRAMMELL. I do not think I have anything further to ask.

The CHAIRMAN. The statements made in this letter, Capt. Laning, approving of the general plan, refer to the plan in operation in August, 1918, when this letter was written?

Capt. LANING. Yes, sir.

The CHAIRMAN. That does not, as I understand it, refer to the first six months of the war?

Capt. LANING. No, sir.

The CHAIRMAN. And to the matters that were connected with Admiral Sims's letter of January 7?

Capt. LANING. No, sir; that dealt with the time at which the letter was written, August, 1918, if I am correct in the month. By that time a more or less well-defined plan had been built up, and I stated in my direct testimony that especially a correct and sound general plan was built up, and this was the result of it. But it was in the early stages that we should have had a plan and did not have it.

The CHAIRMAN. And it does not approve of the lack of support that was not given to Admiral Sims during the first few months of the war or the failure to furnish him with a sufficient staff to conduct his work?

Capt. LANING. Not at all. This letter dealt only with the question of manning some submarine chasers. The question of supplying officers to Admiral Sims's staff came up largely before I entered the Bureau of Navigation. You see, I did not get there until July 16, 1917. I do not remember now what arrangements had been made, but subsequent to that time we did try to send him officers whenever he asked for them; and ultimately I think we got him practically all he needed.

The CHAIRMAN. What were the circumstances leading up to the writing of this letter? Were you asked to write that letter by the department, or was it a private letter?

Capt. LANING. No, sir; this was all personal correspondence. Capt. Pratt had received a letter from Admiral Sims inclosing a paper entitled, "Set a thief to catch a thief," and the idea was that if you wanted to catch German submarines the thing to do was to put our submarine officers on subchasers, and that they knew the tricks of the submarines and would catch them; and it went on in any way to rather criticize the distribution of officers. Capt. Pratt handed me the letter and said something about its being one of my pigeons and not his, and that I had better prepare a reply; so that I wrote this long letter to Admiral Sims, so that he would get an idea of what the personnel situation was with us at that time. That was in 1918, a year after the war started. I think I made pretty clear in that letter that the personnel situation was still pretty bad.

Senator TRAMMELL. The chairman's question suggests another inquiry on my part. Of course, the letter speaks for itself. That

Digitized by Google

is the best evidence. The letter is a very strong defense of the action of the Navy Department up to that time in the matter of the subjects touched there in the letter. Now, while the subject involved in the original Carter criticism, of setting a thief to catch a thief, might have been in regard to providing officers for those chasers, you went ahead and elaborated on several other subjects in the letter, discussing the general plan of the Navy and going into the transport question and everything of that kind; and the chairman, as I understand, wants to rather make it appear that this was at the inception or the dawn of this plan. If that was true, why did you go ahead and recite in here the accomplishments that had been made by the department up to that time?

Capt. LANING. I do not understand the question, Senator.

Senator TRAMMELL. I do not say you agree with that idea, but the chairman wants to convey the idea, apparently, that this was at the beginning of the plan.

The CHAIRMAN. I wanted information.

Capt. LANING. He did not convey that idea to me.

Senator TRAMMELL. Yes.

Capt. LANING. When he asked me the question he conveyed the idea that at this time there was a plan and that it was not a plan that was evolved in the first two or three or four or five months of the war, and when I answered him I told him that it was not a plan that was evolved in the first three or four or five months of the war, but it was evolved in the course of the war up to that time. That was a year and a half, approximately, after the war started.

Senator TRAMMELL. Now, if we are going to bring in the question of a year and a half after the war, at the period of this letter, August 26, 1918, what had the Navy done toward furnishing transportation for troops?

Capt. LANING. They had furnished a great deal of transportation for troops?

Senator TRAMMELL. As a matter of fact, we had over a million soldiers over there at that time, and you took the position in your letter that that was even probably more important than the submarine proposition. You gave importance to each, but you emphasized the question that the man that was dealing with the submarine proposition must not lose sight of the other problem.

Capt. LANING. Yes, sir.

Senator TRAMMELL. Now, this letter was really commenting very largely not only upon the plans, but you also recited more or less as to the accomplishment of the plans, on August 26, 1918; told what number of officers you had in training and men and about the 47,000 at camps on the Great Lakes; and you did not utter any criticism at that time about what had not been done during the first three or four months of the war.

Capt. LANING. Why, of course, I did not; no, sir. I would never have uttered as much to anybody, until I was called before this committee.

Senator TRAMMELL. I notice that you rather resented Admiral Sims's threat about investigation. That is one part that you seemed to take to heart more than anything else, may be.

Capt. LANING. Yes, sir; I was personally concerned in that.

Digitized by Google

Senator TRAMMELL. Here is an extract from Admiral Sims's letter. It seems that he had in mind investigations back in 1918. [Reading:]

When the history of this war comes to be written there will be a number of features that will not be very creditable to the United States Navy. If hearings are held on the conduct of the war, a number of rather disagreeable facts must inevitably be brought out. Without going into details, I may say that as far as the Navy is concerned, we will have fought this war with the bulk of our experienced personnel of the Navy on the side of the ocean where there is no war. We will have to be able to show that it was entirely necessary that we should have had to fight the war over here with a very large proportion of reserve officers who did not have the necessary experience.

You say this, in reply to that. [Reading:]

And it is that paragraph that hurts. Are you sure that the bulk of our experienced personnel is on this side of the water now? Of course, if you don't count the cruisers and transports you are right, but if you do count them as being engaged in active work you are wrong. Do you realize that ultimately two-fifths of our experienced personnel will be on destroyers alone and of the remaining three-fifths at least half will be over there before the war is over, provided, of course, transports and cruisers may be considered as working in the danger zone? The bulk may not be there to-day, but we are expecting them to go and are planning for it. Please remember experienced officers number all told only about 2,370, and there is much for them to do over here that may be less spectacular and not deserving of credit yet for all that it is work that without which the Hun can't be licked.

You, at least, did not agree with Admiral Sims's criticism in that particular letter. Admiral Sims had his criticism about the way you were handling the personnel and the officers, and you at that time joined issue with the admiral on that question, and stated that you were doing the best you could with the whole plan considered, and that the primary mission should not be set aside for a secondary mission. That is what you said in that letter. I have just read that extract there. That is all, I think.

The CHAIRMAN. Capt. Laning, in August, 1918, the submarine sinkings were what, do you remember?

Capt. LANING. No, sir; I have no statistics on that.

The CHAIRMAN. I think the testimony shows that at that time there was something like 100,000 tons a month.

Capt. LANING. They had been greatly reduced at that time.

The CHAIRMAN. They were greatly reduced and the submarine menace was practically under control at that time, was it not?

Capt. LANING. Well, it was only about the middle of the summer, or immediately after the middle of the summer, that the sinkings began to decrease materially; but the exact statistics I do not know. But we began to feel certain, then, that we were going to get the troops there in time.

The CHAIRMAN. At that time we were still sending troops over in large numbers?

Capt. LANING. Oh, yes, sir; the troop shipments each month were very heavy, I think.

The CHAIRMAN. So that with the submarine situation under control and with the vital importance of sending troops over, might not that account for a change in plans?

Capt. LANING. Yes, sir; but I do not——

The CHAIRMAN. Whereas, in the early part of 1917, it might have been vital to take care of the submarine situation, in August, 1918, that had ceased to be a vital matter?

Digitized by Google

Capt. LANING. Oh, the situation changed very materially in that time.

The CHAIRMAN. That is all.

Senator TRAMMELL. Well, now, you express an opinion in this letter on the question of the relative importance of the submarine and the providing of transports. You stated in this letter that the matter of providing transports and being sure to make arrangements for getting the troops over was really of greater importance than the matter of the temporary victory over the submarine, at that time. You stated that in that letter, in substance, I, of course, am not quoting it exactly. I just ask you that because the chairman asked you the other question.

Capt. LANING. Yes; I stated that.

Senator TRAMMELL. You stated, once, that if we took all our little force and sent it over there and they defeated our little force, by an effort, with the submarines, then we would have nothing left. You stated that in this letter, in substance?

Capt. LANING. Yes; I stated we could not rob the other cause to send everybody over to hunt submarines.

Senator TRAMMELL. Your letter went into the policy very largely in regard to that of the department, on this side and the other side, and your views were then in harmony with the policy adopted by the department. Any man that reads your letter fairly can not say anything else.

Capt. LANING. No, and I do not say it.

Senator TRAMMELL. Your views were thoroughly in harmony with those of the department when you wrote that letter?

Capt. LANING. Yes, and they still are, even at this time, Senator.

Senator TRAMMELL. That is all I have.

The CHAIRMAN. We will adjourn at this point until tomorrow morning.

(Thereupon, at 1 o'clock p. m., the subcommittee adjourned until to-morrow, Thursday, March 25, 1920, at 10 o'clock a. m.)

Digitized by Google

NAVAL INVESTIGATION.

THURSDAY, MARCH 25, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present, Senators Hale (chairman), Keyes, Pittman, and Trammell.

The CHAIRMAN. The committee will come to order. Capt. Palmer, will you take the stand?

TESTIMONY OF CAPT. L. C. PALMER, UNITED STATES NAVY.

(The witness was sworn by the chairman.)

The CHAIRMAN. Capt. Palmer, will you state what official position you had during the war and what were the general responsibilities or duties of that position?

Capt. PALMER. I was Chief of the Bureau of Navigation of the Navy Department from approximately the latter part of August, 1916, just before the war, until the last day of October, 1918, when I was detached for duty with Admiral Rodman abroad.

The duties of the Bureau of Navigation apply generally to personnel, the recruiting, training, and enrollment of both officers and men, and the assignment of these officers and men to the various activities required by the Chief of Naval Operations. Under the bureau are the United States Naval Academy and the four great training stations at Norfolk, Newport, Great Lakes, and San Francisco, and various receiving ships and seaports, and the recruiting bureaus and offices which are scattered all over the country.

In addition, we have charge of the Hydrographic Office, which provides charts and sailing directions, and the Naval Observatory, which has to do with the nautical instruments and time system.

The CHAIRMAN. Will you state the condition of the personnel of the Navy at the time when you were assigned to the Bureau of Navigation, as to the sufficiency of the officers and enlisted men to man the ships then in the Navy, together with the requirements of shore duty?

Capt. PALMER. I do not believe I will be able to give it in actual figures, except what appeared in the printed reports at the time and the printed report of the present Chief of the Bureau of Navigation.

Just generally, when I came into the office there were approximately 2,100 regular line officers and about 51,000 men, with an addition of only 400 reserves.

There were about 9,000 militia, I should say, but they were not in service and did not get into the service until the war started. Of course, you remember that this was the basis; this was the little force

Digitized by Google

from which we expanded to over 30,000 officers and half a million men. That is, it was a tenfold expansion. But we had only the 2,100 regular officers and approximately 51,000 men.

The CHAIRMAN. Was that the limit allowed by the law at that time?

Capt. PALMER. The law was just put into effect about the month that I came there, and the new law I will tell you about in a moment. This force here that I have mentioned, which took advantage of the opportunity to produce the very large force later on, was the force about which Sir Eric Geddes, of the British Admiralty, wrote, which was quoted here in Congress. I have taken it from the printed record. [Reading:]

The dauntless determination which the United States has displayed in creating the huge trained body of seamen out of landsmen is one of the most striking accomplishments of the war. Had it not been effectively done one would have thought it impossible, but words fail me to express our admiration of this feat undertaken and accomplished by your Navy Department, of which Mr. Daniels is the civil chief.

I knew, of course, from my duty at sea as chief of staff of the battleship force just before I was called to the department, that our Navy was short a very great number of officers and men, so that I got from the chief of navigation a list of the officers that he will probably need for mobilization, and I took that as the basis on which I would make the estimates for our needs.

The CHAIRMAN. That was when?

Capt. PALMER. That was as soon as I came into the bureau.

The CHAIRMAN. In 1916?

Capt. PALMER. In 1916, yes, sir; in the latter part of August. I drew up the mobilization estimate, for personnel, and sent this to all the flag officers and to the captains and to the chiefs of bureaus, so that they could criticise it and send it back to me and say whether those were the actual needs they required, or whether it would not give them enough; and that was the basis on which we made up our personnel assignments.

At that time, when that sheet was drawn up, and this dates back to before my annual report of October 10, 1916, that is before the war, and very shortly after I came in the bureau, we found that we were approximately 950 regular officers short and 1,600 to 1,700 reserve officers short, and about 28,000 regulars, I believe, short, and about 23,000 reserves short.

The CHAIRMAN. That was, short of the numbers allowed by the law?

Capt. PALMER. No, sir. Well, that was short of the number allowed by law. We had plenty allowed by law at that time; but that was short of the number which we required to man the vessels which the chief of naval operations said were necessary to be manned for mobilization; and we had this shortage after we made use of the 9,000 militia and after we made use of the 400 reserves that we had available. This was an actual shortage, and that shortage did not include a per cent for sickness and transfers, etc. I tried to base that shortage on just the actual ships and the shore stations that were required by the office of naval operations.

Now, this is shown in my hearings of December 5, and is also in a memorandum to the department on the subject, which stated this fully; but in my hearing of December 5——

Digitized by Google

The CHAIRMAN. Of that year?

Capt. PALMER. Of 1916, just before the war; the hearings state that we were short at that time approximately 28,000 regulars and 23,000 reserves, after using 9,000 militia and 463 reserves.

Later the chief of naval operations gave us an additional list of vessels which would be required for war, and as those came I revised my list from time to time. I furnished the department with information on the above subject again on February 20, 1917, and on that date I was before the Senate committee on the subject of our urgent need of more officers in the Navy.

In that report I have stated the numbers that we were short for mobilization. And at that time the shortage of reserves on account of the number of ships that Operations wanted us to man for war was 39,000. They had modified their figures.

I also took advantage of that opportunity on February 20, in that memorandum to note that this number did not include any working surplus; that the additional estimates would be necessary to be considered because of the sudden impetus which war or mobilization would give to shipbuilding, which might result in the rapid construction of a great many submarines and destroyers, all of which required active enlisted men at the rate of 9,000 per 100 destroyers; and I outlined the several needs, adding up, roughly, 20,000 for certain definite things.

After that it was found that 96 men per destroyer was not sufficient for war needs, so that had to be modified. However, it was modified, making the shortage still greater.

This thing was generally based on the three-year building program which Congress had just put through. They gave this program, which showed that ships would be completed approximately in 1921; that is, the total would be completed then. So I sent to the Chief of the Bureau of Construction and Repair and asked him to give me the best information he could as to dates of completion of the vessels so that I could prepare the personnel beforehand, and could ask the department to ask Congress for the necessary people. The Chief of the Bureau of Construction and Repair sent me a list of estimated dates of completion, and he put a paragraph in there saying, "This is our estimated date, and things may arise which may change this from time to time"; but generally it showed that the three-year building program would be completed at the middle of 1921, and on that I made my basis of our personnel needs, because Congress had given us a continuing program then on which to work.

The CHAIRMAN. That was in 1917?

Capt. PALMER. This was started before that. In fact, it was the first thing that was started in the bureau, and in my first annual report, which was printed on the 10th of October, 1916, there was contained a statement that I had prepared this estimate sheet, and it stated on the first page that I estimated, for instance, that we would need 93,000 men plus 10 per cent, roughly something over 100,000 men to mobilize that immense force of the three-year building program plus approximately 43,000 reserves.

The CHAIRMAN. But that was before we had gone into the war?

Capt. PALMER. Yes.

Digitized by Google

The CHAIRMAN. And the plan was not a war plan? It was simply a peace plan, providing for the increase that Congress had provided for.

Capt. PALMER. Yes. We really had no authority to go ahead with arranging anything on a war-plan basis. In fact, there was quite enough to do to get action on the peace plan work because of that large increase. Most of this data was presented to the department and submitted to the Congress in the recommendations to bring out particularly our necessity for more officers. We were away behind, and I wanted to get the course at the Naval Academy shortened to three years, simply to make up the number of people who would be required to make this material building program a real live one. For instance, one thing we had to start on was the recruiting service. The recruiting service had not been required to do any special work, because we had only a certain number allowed by Congress, and the machinery was not in operation. It was necessary to have it in operation, so that was one of the principal things that I had to undertake—to reorganize the recruiting service.

The CHAIRMAN. Can you tell me what provisions of law existed under which expansion of the regular personnel could have been accomplished by means of reserves?

Capt. PALMER. Yes. I can refer best——

The CHAIRMAN. Pardon me. Did you have something further to say on the other matter?

Capt. PALMER. No, sir. I can refer best to Admiral Washington's report of this year—he is the Chief of the Bureau of Navigation—in which report he has very ably laid out the things that were done by Congress to give us ample provision to provide personnel. The first step, of course, was the law that Congress put through, the act of August 29, 1916. That gave the authority for an increase of the enlisted personnel to a total of 68,000 enlisted men plus 6,000 for apprentice seamen. That is a total of 74,000 men. This further gave the President authority to increase this number of 68,000 to a total of 87,000, and we assumed that that would allow 6,000 apprentice seamen also, and that authority was equal to 93,000. That was to be given in case of emergency. And the President, when he was asked to do that, when the request was taken to him by the Secretary on the 5th of May, 1917, signed it immediately. The President signed the thing immediately as an emergency measure. There was also a reserve bill which was worded so that it was quite difficult to give it a definite, legal interpretation on many of the points, but it was also so worded that a favorable interpretation would permit you to do anything with it. It is one of the best things we have ever had. We could do anything we wanted in order to advance the interests of the war.

Senator TRAMMELL. What was the date of the passage of that?

Capt. PALMER. August 29, 1916.

Senator TRAMMELL. August 29?

Capt. PALMER. Yes. Now, the further things that were done: On May 22, 1917, Congress authorized a temporary increase from 87,000 to 150,000, and also an allowance for an additional 10,000 apprentice seamen.

Digitized by Google

The next thing was on July 1, 1918, when Congress authorized a permanent increase to 137,485 men, including apprentices, and also gave a temporary force of 181,000 plus 24,000 apprentices, and increased the flying corps from 350 to 10,000. That latter was quite a jump. I must say that Congress was practically unanimous in giving us everything that the department asked for and for pushing the war to a successful conclusion.

The CHAIRMAN. The same was true just before war was declared, was it not? The large increase was provided?

Capt. PALMER. Yes. This dates back as long as I was in the bureau, which goes back to the latter part of August, just before the war. All that the Navy Department had to do was to ask and Congress gave things. Our naval committees in both the Senate and House showed the most hearty spirit of cooperation, and the whole attitude was plainly "Just show us how we can help you and we will do it."

I remember particularly in this Senate Naval Committee the two party leaders were assigned to the committee for naval work and to handle our war needs. There was the acting chairman, and later the chairman, Senator Swanson, and Senator Lodge. They impressed me that they were going around like two brothers. They could be found together most of the time, and they were all working to do everything they could for us. They let it be known that they could be reached at any time, day or night. Senator Swanson and Senator Lodge, who were charged with this thing, let it be known that they could be reached at any time, day or night, for anything so far as the department was concerned, and that was the attitude as to everything.

The CHAIRMAN. Also that prevailed before the declaration of war?

Capt. PALMER. Yes. In fact they were of the greatest help to me. Senator Swanson and Senator Lodge, who represented the committee at that time, were of the greatest help to me.

Of course in peace times a navy should have a sufficient number of regular officers and men to properly man all the vessels of the active fleet, together with a certain percentage for shore allowances, and then for the vessels in the reserve force we should have 50 per cent of active personnel and allow for the other half for reserve personnel. Of course it would be a great deal better for us to have all regulars to man all the ships, active and reserve, but it is a question of congressional appropriation, and if they cut down it is best to make some plans such as having 50 per cent of the personnel on the reserve ships to be composed of regulars and 50 per cent of reserves. Of course that is my opinion after going over the personnel situation during the war. Of course that was not the condition at the time war was declared, and the naval peace personnel was far short of the peace requirements. That is simply to man the vessels, which the Chief of Naval Operations told me had to be manned. That is just for peace time and the mobilization business.

The shortage of regular personnel at the declaration of war was, of course, the initial handicap of the Navy's activities, because the Navy had to begin at once and have our officers and men afloat. The main point is that lots of people can talk understandingly of number of ships and their money value, but a very much smaller number realize that ships are only effective when they are efficiently manned. There is no charge against people for not knowing that,

Digitized by Google

because it is quite human to talk in material things, but when you are dealing with personnel and know what the needs are, that is the main point about it.

Personal requirements do not receive sufficient attention from my point of view. When a ship is authorized, of course the personnel should be authorized by Congress in sufficient time to have that personnel recruited and trained. Now, I have spoken of that in my annual reports, and I think people are generally in accord with that idea now. It was not originated by me, but I brought it out at several places in the printed report, that a proper procedure would be, if it is possible to authorize the necessary enlisted personnel approximately two years before the estimated date of completion of the ships, where that can be done. Of course, the estimated date of completion will change, but that two years was what I assumed was a reasonable allowance for the time taken to recruit and to train them.

The CHAIRMAN. Admiral, what recommendations did you make prior to the war and during the first few months of the war to prepare for the necessary personnel, with particular reference to the enlisted men; and also state whether the department did everything possible to assist the personnel bureau in these recommendations, or if it did not, in what particulars it opposed them.

Capt. PALMER. I do not know that I can——

The CHAIRMAN. What recommendations did you make personally about the enlisted men?

Capt. PALMER. I do not know that I can give that in detail. I have not all the papers on the subject. My recollection would cover a good many of the points, but I would not say that I could give them all.

The CHAIRMAN. Can you tell us in a general way?

Capt. PALMER. Let us see. Of course the first thing was to reorganize the bureau, to put that on a business basis that would produce the proper number of men and officers, that we were ordered to prepare. It did not take much time to organize the bureau.

The CHAIRMAN. This was done prior to the war and during the first few months?

Capt. PALMER. Yes; it did not take much time to prepare a few simple organization principles, and we carried out that organization during the war. I have stated it in my annual reports here. I first started the organization of the recruiting service, put it on a practical basis, so that we worked up from practically no enlistments, to 1,300 in January. We were gradually working up.

The CHAIRMAN. What was that date?

Capt. PALMER. Just roughly, in January. I have not any accurate dates on the subject.

The CHAIRMAN. Nineteen hundred and seventeen?

Capt. PALMER. Nineteen hundred and seventeen. Of course the war was not then an assured fact, and we did not have that inducement to make the young men come in. I think if they had known that war was really coming, they would have jumped in just as they did as soon as they found it out, but it did not start immediately. It took some time to work up the recruiting districts. You see the recruiting districts which were under my bureau were spread all

Digitized by Google

over the country, and these had to be increased largely in number and in personnel. In the month of January the recruiting service, of course, got more than had been obtained in the whole year before, but that was simply due to the fact that they were not authorized to recruit any more in the year before. There was a certain limited number of men allowed by Congress.

The bureau itself was first organized to meet all those conditions. Now one point for instance in preparation. We got our Navy recruiting publicity bureau in New York speeded up, and they did wonderful work in enlisting and enrolling the assistance of the newspapers, and we got the newspapers and periodicals all over the country, through that bureau, to help us out and they gave us assistance unpaid. I should say we recruited about everybody in the country to help us, and they did come across. In fact, I do not know of anyone who did not help us, in the various activities of civil life. The churches got into it, the amusement houses, the business people, the artists, the clubs, in fact, everybody without distinction of class or profession, and we also reaped the benefits of the work that was being done by the officers and members of the Navy League all over the country who had been endeavoring to help us out on recruiting. That organization was not prominent at the time as far as coming to me about things was concerned, but we reaped the results of their work, and they were actively engaged in helping out the Navy. I know that they offered large cash sums to promote different works in the Navy. When we were before the House Naval Committee in order to get sites for places to build barracks, we were told that we could get a site somewhere on Long Isalnd. I think Mr. Hicks told us that, and we began to look into those sites, because we had no authority to expand the training station at Newport, which, of course, was the proper place to expand it. However, I think those people of the Navy League heard about our needs for barracks there and they offered to furnish the money and build all the barracks if we would get the land. That was not done, because I think Mr. Franklin Roosevelt about that time took up the subject with Newport, and we thought that we were going to get the ground there, which would have been very much better for us to expand from a place which we had than to establish a new overhead by going to a new place.

In common with a good many other people at this time I believed that the war was coming very soon, and so I speeded up all the activities that I could. I arranged, for instance, with the commander in chief of the Atlantic fleet, while his force was still in West India waters, to put five petty officers on each battleship in active training to be officers in case we should enter the war.

The CHAIRMAN. Do you remember when that was?

Capt. PALMER. No; it was several months before the war started when that was initiated.

The CHAIRMAN. So that several months before the war started you were very certain that war was coming?

Capt. PALMER. Yes. That is, I was certain as far as my belief was concerned, that war was coming.

The CHAIRMAN. That was your belief.

Capt. PALMER. Yes.

Digitized by Google

The CHAIRMAN. Was that the belief generally in the department?

Capt. PALMER. That was the thing I was going on, in order to provide personnel, and that was the belief on which I acted when I came down here before the various committees on the propositions that we required to put through. In that particular case, that was just an incident to show that there were several steps taken to push this thing: and that was the first definite step toward making commissioned officers from enlisted men. We had not done that before, except through the ordinary course of events, but it was evident that we were so far behind in officers that we had better take some steps so I wrote to the commander in chief a confidential letter, because we could not state anything about getting into the war; but we knew we must have officers, and I wanted to start that and try it out, and all the officers in the fleet were anxious to advance every enlisted man who had ability. They have always been that way, and they thought they could put it over. So they put these men on watch, just took the officers off and put the enlisted men on watch, those who were capable, and they came across beautifully.

It was rather slow getting it started, but they had them trained, and Admiral Mayo reported that the thing was an entire success. Although that was started by the bureau then, that was not an original idea of mine, because officers had suggested that from time to time, and as far as that is concerned all the things that were done by the bureau during the war were really not original propositions. They had been suggested from time to time by officers who had been thinking about this.

Now, at that time I urged the listing of merchant ships under the American flag. This was along in December, I think, that I suggested that, so that we could enroll that personnel. That was a kind of personnel that we needed very much during the war, because we had nothing in the way of a merchant marine. We did not have sailors and navigators, as some of the other countries had.

The CHAIRMAN. This was in December, 1916?

Capt. PALMER. In December, 1916, before the war. We wanted to be able to employ those officers and such men of them as were capable.

Another important point about that was that we could enroll them, and if we had authority to enroll them, then we could start in teaching them and give them the necessary instruction as to naval ways, so that when war did start we would have that force prepared instead of having to do all the teaching afterward.

This matter of listing merchant ships was started. It was considered by naval operations to be most important, from our personal viewpoint, and I think we got them partially listed somewhere along in January or February. That was one of the steps of preparation.

Now, in the printed hearings before the Senate Naval Affairs Committee on February 20, 1917, quoting a memorandum that was given to the department at the time, it was shown that we would speed up on shipbuilding. All our work in the Bureau of Navigation was based on the estimate that we believed the war would last about three years. Of course, that was simply our own estimate, in order to go ahead with work. Actually, in coming down to the definite preparation of personnel we worked out a sheet which was good for a

Digitized by Google

year in advance, from the knowledge we had of the things that ought to be undertaken, and from the orders we had from the Chief of Naval Operations. So that we knew at any time where we were going to get the personnel and how we were going to train it and where, at all the different schools, training stations, and colleges, and just how long it would probably take to deliver these men to the Navy, that is to follow out what the Chief of Naval Operations wanted us to do.

In all this work, as it continued during the war, every activity of Naval Operations whether afloat or ashore was carried out, certainly to the extent of numbers of officers and men. That is, we had the men and officers ready by the time the ships were ready to start; but, of course, that is not saying they were trained. They were trained as well as they could be in the time that had been given us.

Now, in this work of the war activities, whether afloat or ashore, the few regular officers that we had to start with in both the line and the staff, and the few regular men we had to start with, were responsible for the wonderful work that was accomplished afterward, because they expanded ten-fold, and while they were expanding and training other officers and men they were doing all these active things that were asked for by the department.

The CHAIRMAN. Captain, what I want to find out is whether you yourself made any recommendations to the department about preparing for the necessary personnel to be used in the Navy?

Capt. PALMER. Yes.

The CHAIRMAN. About enlisted men especially?

Capt. PALMER. Well, I wanted to get in the enlisted men.

The CHAIRMAN. Whether you made direct recommendations to the department?

Capt. PALMER. Oh, yes: I made direct recommendations to the department, based on the knowledge of our great shortage of regular personnel, simply for peace needs, at the beginning of the war. This, of course, was based on the instructions from the Chief of Naval Operations, and I urged the department to do everything in their power to assist the recruiting of regular enlisted men.

I should state generally that the department did this. The Secretary backed it up. He liked to see the members of the enlisted men coming in, and he spoke of it and wrote about it many times. He wanted to see the enlisted men come in. Of course, some of the things about getting them in were very difficult for us, because at that time, or before the war, the Secretary would not let us employ retired officers, and we were so far short of men that we needed officers at all those stations to be able to recruit the men, and without being able to employ officers and other men we could not recruit the men. That was the great difficulty; that is, the delay in getting the use of retired officers who were willing to come. I do not know just why it was that that was not allowed, but I know it was not allowed.

The CHAIRMAN. They delayed you in getting the necessary enlisted men?

Capt. PALMER. Yes. I will not say that that delayed us—that it delayed anything in the war though. It delayed us in getting men in order to fill out our schemes, and, of course, it had something to do with delaying the training of them.

Digitized by Google

The CHAIRMAN. But, in general, the Secretary approved of the plan of the increasing of the enlisted men?

Capt. PALMER. He did.

The CHAIRMAN. Now, how about officers? Did you make any recommendations about increasing the officers?

Capt. PALMER. If I may finish on the subject of the enlisted men first——

The CHAIRMAN. Yes.

Capt. PALMER. As I understand it you want to know what steps I took, and whether I did my part of the job as well as I knew how?

The CHAIRMAN. No; we do not question that, Captain. You are not on trial. We simply want information about whether you were backed up by the department.

Senator TRAMMELL. I think what we want to get is the facts, all of them, not whether the facts reflect on anybody or commend anybody. We want commendatory facts if there are any, just as well as facts that reflect on anybody. That is the fair thing to do.

The CHAIRMAN. Yes.

Capt. PALMER. I think I am open to as much criticism as anybody else on this, and if I did not do the things correctly, I think now is the time to bring it out.

The CHAIRMAN. But you yourself are not on trial in any way.

Senator TRAMMELL. The defendant is absent to-day.

The CHAIRMAN. I do not know that there is any defendant.

Capt. PALMER. It does not make any difference to me. I would just like to mention here that in all this business I am very keenly appreciative of the wonderful work that our naval officers and our regular enlisted men did, to buck against all the obstacles that we had, which, from my point of view, personally, were due to the original shortage of personnel. I have never had the opportunity to say before how keenly appreciative I am of the wonderful work that these officers and men did; but I want to say that in addition to the regular service people in line and staff, when we got hold of the reserves and militia and national naval volunteers and coast guard people, and the reserves of various classes, including the yeowomen, who helped us out so wonderfully during the early part of the war, they are deserving of just as much credit.

We got, during the war, of, course, a great many of the retired officers in. In fact, there were five retired rear admirals and five of the armed guard commanders who had been in my bureau for years and years, and they came across beautifully; and they not only were thoroughly loyal in the way they did things, but they had the ability, too. They showed up beautifully.

Now, I started schools, or rather I did not do it, but my training officers, Commander Overstreet and Lieut. Bennett at the time, were responsible for any good from those; they started schools in the training camps and in colleges and technical schools in every place all over the country; and these schools were added to from time to time as the additional requirements came in for those things. I make a reference to the scope of these schools by referring to about what they were, to show what the Navy was doing. They had schools for practically all trades, and that including courses for divers and electricians and radio men, carpenters, machinists, blacksmiths, cop-

Digitized by Google

persmiths, shipwrights, painters, bakers, cooks, stewards, hospital corps men, fuel-oil men, winch men, camoufleurs, musicians, yoemen, gunners, coxswains, signalmen, steel and concrete construction men, enginemen, water tenders, firemen, quartermasters, helmsmen, gyro-compass men, optical mechanics, lookouts, armed-guard crews, submarine crews, motor-boat men, hydroplane crews, kite and free balloon specialists, mine-laying and mine-sweeping experts, paravane operators, torpedo men, hydrophone specialists, aviators, aviator mechanics of all classes, etc.

It just goes on for any operations we were called upon for. That was a part of the work of the bureau on that, and in addition to that we had hundreds of universities and technical schools and manufacturing establishments and hotels and civilian organizations, all very keen to help out themselves on this.

The CHAIRMAN. Did you make recommendations about these different schools?

Capt. PALMER. Yes.

The CHAIRMAN. Were those recommendations followed out?

Capt. PALMER. At the training stations I gave instructions to the commandants about the schools, and they carried them out. They were indoctrinated with the bureau's idea of what was necessary for the war, and I really was able to keep hands off altogether. I delegated the authority to them, and they came up to the mark and delivered the goods.

As far as the other schools were concerned, where they were initiated at places outside of the training stations, at schools, we had a good deal of difficulty in getting them through. There was the question as to whether we needed the people. I think it was all due to the fact that the department could not see the need of getting hold of the men long before and training them. They did not appreciate that it took time to train people for engineering duties, and so forth; and there was the general attitude of "Well, we can postpone that"; but we could not postpone it. I know how long it took to take these people and train them, and we could not postpone it; and we really had a great deal of difficulty in getting the schools through.

The CHAIRMAN. When did you first take up the question of starting the schools?

Capt. PALMER. Well, we started schools of one kind and another before the war. We took up that question with the department and of course at that time war was not declared. But my opinion was that we were going in war; and there was another thing that moved me very strongly, and that was that the office of naval operations would say, "Well, we will probably have to do this, and that"; and that meant, for me, going far enough back to get the men recruited and trained in time so that I could deliver the goods when they were called for.

And another thing was that the general board had some paper which the Chief of Naval Operations sent to me, on which to base my work and prepare for work, and that paper said that the Bureau of Navigation should have the personnel ready within a week of the time that the operation was ordered. Of course you can not get the personnel within a week of the time, unless you have taken steps long before, and that was the point that I brought up to the department.

Digitized by Google

This was before the war, and during the war this was a continuing thing. There was just lack of appreciation of how long it takes to train people, how long it takes to build the barracks, and get things started in order to carry out the instructions that came indirectly from the general board. To be prepared when the ships were prepared with the personnel, I had to start long before.

Senator KEYES. Capt. Palmer, who had that lack of appreciation?

Capt. PALMER. Mr. Daniels, the Secretary of the Navy, was the one with whom I was most closely associated on these things. That is my opinion of it. Mr. Daniels, as you know, wanted to have these things done, and I know that he was badly worried on it in the end. I could refer to his annual report and to his speeches, and so forth, as showing this, and I know that he was really delighted that these things were done; but it is my impression that he did not—he could not appreciate the needs as we saw them. I was charged with the personnel business, and I had studied the thing carefully; and not only I myself, but all my officers; and we were convinced that certain steps were necessary for preparation in order to be able to carry out the chief of naval operations' orders to provide men in time. Now, of course the chief of naval operations frequently said, "It is probable you will have to man so many ships of this kind, and you had better get the men for them." The important thing for me to know was when those men would be required; and in each case, operations required "We want them as soon as we can get them. We would like to have them now, or within a few weeks." Of course I knew we could not recruit men and train them and get barracks for them in a few weeks. So that, after one or two orders of that kind, and things that operations could not have foreseen the need of, I decided that it was up to me to be prepared for any operation they had, and to take the responsibility of going ahead and working this organization into a production plant, keeping it up to peak load all the time so that I would be prepared for anything that came across.

The CHAIRMAN. And you took matters in your own hands and went ahead?

Capt. PALMER. Yes; I did. I did not do that, however, until after I had exhausted every means to get the thing done. I think, though, the whole thing was due to procrastination.

The CHAIRMAN. On the part of the Secretary?

Capt. PALMER. Yes, sir. I was forced——

The CHAIRMAN. Did the Secretary give you any reasons for delaying the carrying out of the plan?

Capt. PALMER. Well, no reasons, of course, that appealed to me or appealed to our people that were charged with personnel; but he would say "We have too many reserves now. We don't want any more."

The CHAIRMAN. This was within two or three months immediately preceding the war?

Capt. PALMER. And after the war.

The CHAIRMAN. And after the war had begun?

Capt. PALMER. Yes, sir.

The CHAIRMAN. He said that we had too many reserves?

Capt. PALMER. Yes, sir. That was due to a lack of appreciation of what was required in order to get the people together. On the one hand, I had the office of Naval Operations stating that things

Digitized by Google

were to be done—were to be started—and I knew that if I did not have them on time I would not be doing what I was ordered to do. I was charged with seeing that the personnel was provided in time; and on the one hand I was pushed by Operations to get them, and on the other hand I could not make any headway with the department in getting the steps necessary to take in order to get them. For instance, take the subject of housing the men, and a good many other items; I simply got the statement, after many trials and presenting the thing in its most forcible manner, "We have no appropriation," and I think that was the correct statement. But still, Operations wanted me to do these things. They said, "We have got to have the men at that time;" and this meant getting ready months before, for each one of these things. So that when I came to that point and came to a stone wall on it, I decided it was best to go ahead and take steps necessary to deliver the men in the time, even if we did not have the appropriation or did not have the authority.

The CHAIRMAN. One minute, Captain.

Capt. PALMER. Yes, sir.

The CHAIRMAN. In regard to appropriations, you have already stated that Congress was ready to appropriate anything that the department asked for?

Capt. PALMER. Yes, sir. I know the members of this committee said, "We will do anything we can for you, any time," and I felt confident that Congress would do anything the department asked; and I also felt confident that if I took the responsibility of going over the—getting around the law, in order to get the appropriations in time—I had heard all the Senators and all the Representatives, and the statements of the people all over the country that they were going to fight the war to the limit; and so I thought they meant it, and believed they meant it, and I thought there was no reason for delay on an appropriation that would delay our works for months, and the best thing would be to go ahead with it, to take such steps as I could and go ahead with the thing.

So I arranged, for instance, with the captains of the training stations, particularly with the Great Lakes training station, and we came to the conclusion that the work could be done, and that we could get it done without having full authority of Congress at that time, and waiting; and by the time it could be presented to Congress by the department we might be along a couple of months on these training stations, and be just that much in advance, so that we would have some place to put the men, for instance, in cold weather.

I would like to say that the Congress did not come across that way. I was called before the Appropriations Committee and was asked why—they said that they had heard that barracks were actually being built out at Great Lakes and some other places, and they asked how they were built without any money, and I told them that it was my responsibility; that when I could not get authority to do it, when I could not get the department to take the authority on that point—and I do not question whether they should have taken it or not. There may have been things that kept them from taking it, but when they would not take it, I went ahead, with the assistance of the commandants at the stations. And you probably all have heard of

Digitized by Google

the Great Lakes Station and the way it boomed ahead, but we never had even at that station enough quarters for the men in the time. But we were very much further on to the required number than we would have been had we delayed and waited on the appropriations.

Now, before that Appropriations Committee they mentioned the fact that I had, in a way, taken the law into my own hands; but they also were very pleasant about it, showing that they approved it, and they actually did approve all the expenditures.

The same thing happened before the House Naval Investigating Committee which investigated the war, I think some time in the latter part of 1917, and they note here in their report of investigations:

> At the commencement of the war our training stations could only accommodate about 6,000 seamen; but the Chief of Navigation early assumed the responsibility of increasing the housing room at the various stations, and we now have at the various training stations barracks for more than 50,000.

That is, they approved the action taken in advance.

That is about all I can remember for the time on the subject of enlisted personnel.

The CHAIRMAN. What about the enrollment of officers and men in the Reserve Force?

Capt. PALMER. As I said, that reserve law, you could do anything with it. The first thing was to get legal decisions on it. It took considerable time to do that. It was signed in the latter part of August, and it took a long time to do that; but it gave us authority to do anything we wanted, so that we got favorable decisions, one at a time, and started in enrolling. I sent some officers out to the Great Lakes district, for instance, to get hold of those officers and men who were seamen, and there were a few we had in the country, seamen, who were tied up on account of the ice in the Great Lakes, and we actually got them before the war and sent them down to Admiral Mayo's fleet, and had quite a number of them down there.

But in January there was something appeared in the papers stating that we now had over 1,000 reserves, and I am not sure where it was published; but, at any rate, it was brought to the Secretary's attention, and he said that he wanted the enrollment stopped. He said, "We have got enough men now. We have got enough men for a year." Of course, we told him what our needs were, and that we did not have enough men; that we were just on a peace basis, and we were short about 1,600 reserve officers and 39,000 reserve men and we ought to hump it along and enroll just as fast as we could and get these people in. He said, "No; I want it stopped."

The CHAIRMAN. Who said that he wanted it stopped?

Capt. PALMER. The Secretary.

The CHAIRMAN. He said that he wanted the enrollment stopped?

Capt. PALMER. Yes; and he gave the order that they should be stopped.

I would like to say that I had a talk with the Secretary just a few days ago, and the Secretary does not remember anything about that. He said, "I have no recollection of it." I told him some of the details that happened at the time. The Secretary asked me, "Can you produce the written order?" I told him that I could not; that it might be there. But he gave me the order directly, and told me he

Digitized by Google

wanted them stopped, and that was the first time. I mean, he frequently told me to stop. The reason he frequently told me to stop was because we had to go ahead and get them.

The CHAIRMAN. That was the first time he told you, and that was when?

Capt. PALMER. The latter part of January.

The CHAIRMAN. 1917?

Capt. PALMER. Yes, sir. I do not remember the exact date, but I remember it was very strongly impressed on my mind, because our whole scheme of getting officers and men and training them for the war depended on whether we could get the people in early; and I frequently got the statement, as an argument, "Well, the ships are not ready yet; so, just wait until we get a little more information about them." But I knew they were going to be ready, and I knew that the day they were ready we could not get the people started; so that I did enroll them. I made exceptions——

The CHAIRMAN. That is, you did not stop the enrollments?

Capt. PALMER. No, sir.

The CHAIRMAN. Later on, after the war had started, did the Secretary again order the enrollments stopped?

Capt. PALMER. Yes, sir; they were ordered stopped—oh, I should say three or four times. But in the meantime——

The CHAIRMAN. Up to about what time?

Capt. PALMER. Oh, I should say—this is just a general guess, but I should say—along about the latter part of 1917.

The CHAIRMAN. The latter part of 1917?

Capt. PALMER. Yes, sir; and it was done later, too; but, for instance, when I was ordered by the department to prepare, or when we were told we would have to prepare, for taking over all the merchant marine vessels, I knew that that would require more than six months' preparation before we would get anything of value; and later on we actually did get the order from them to man a sufficient number of vessels, and they called for 222,000 officers and men. That was one single order. And I had the machinery going so that we could deliver those men by the time the ships were ready, all of them. They would not be the best trained men in the world, but they were the best we could do, and that was possible because we went ahead with enrollments in time.

The CHAIRMAN. At the close of the war, of the 500,000 men, substantially, that we had in the Navy, how many were in the reserves?

Capt. PALMER. There were more men in the reserves than in the regular service. When I left the bureau, which was the last day of October, 1918, I think we had approximately 290,000 reserves.

The CHAIRMAN. Practically 3 to 2?

Capt. PALMER. Yes, sir; 290,000 reserves; and at that time we had approximately—well, we had over 30,000 reserve officers. Now, just that fact, that we got those people and that they kept on going, showed me that the department was really pleased that it was done after it was done. I know we were often called on to give the number of reserve officers and men, when the Secretary was to make a speech, and it was always a question in my mind whether the storm would not break after he found out that more men had been enrolled than he knew of the last time; but in pretty nearly every case the Secretary was pleased with the numbers. He was pleased with the fact

Digitized by Google

that the barracks were built. He went out and inspected the Great Lakes, and he was delighted with the barracks, and I really believe that everything that was done along that line was done so that it redound to the department's credit. In fact, so far as the enrollment of reserves was concerned, and when it was ordered stopped at one time, I told Mr. Daniels, "Those people are going to save the day for the Navy. We can not afford to stop enrolling them." I said, "We started with an initial shortage, and this will get us out of a very difficult predicament." If we had been required, of course, to go into the war with a single enemy on the 6th of April, 1917, we would not have been able to take any of the officers and men from the ships which would be required to go into the area of operations and engage in actual battle. I could not have induced anybody to let me get them off the ships; and therefore it would have not been possible for us to do any of that training. I want to say that conditions were very favorable so far as the conditions of this particular war are concerned, and we ought not to make conclusions that because we won out on that proposition we could win out again if we had to go right out and fight.

The CHAIRMAN. Did the Secretary ever criticize you for not carrying out his orders; or did he ever talk to you about the fact that you had not done so??

Capt. PALMER. Well, the Secretary sent for me several times on the subject. In fact, I was in the Secretary's office at least a dozen times each day. This was all, generally, in regard to the details of assignment of a man or an officer, or something like that, that he wanted to ask about. He said, "I told you to stop the reserves, and it has not been done. Now, I want to see the order about stopping the reserves"; and he wanted them stopped. Pretty soon he would find out that some one was in some place, and he would ask me about it. I would say, "Mr. Secretary, we had to go ahead. We needed these people and those people." And I said, "We got the word from Operations and we simply had to go ahead." Well, the general thing was, "Well, don't get any more." That was the general idea.

The CHAIRMAN. If you had not done so, the Navy could not have performed the signal service during the war that it did perform?

Capt. PALMER. It could not have done anything, sir. It could not have done anything.

The CHAIRMAN. Now, Capt. Palmer, can you tell me anything about the plan to shorten the course at the Naval Academy?

Capt. PALMER. Well, yes, sir; I can. I was very much interested in that. It all comes back to the shortage at first. I took up the question of increasing the number of men there, and Congress was always willing to do that; and I took up the question of reducing the course from four years to three years for such a period as would be necessary to provide the necessary officers for the three-year building program. Even if we reduced the course to three years, the best we could do, as far as graduates of the Naval Academy was concerned, was to be in 1921 still shy about 500 officers.

Now various people had different opinions on that, and the idea of the Secretary was that the course should be increased. In fact, that was what he said time and again. He said, "My idea is that we should increase the course to five years." I was not in accord with

Digitized by Google

him on that. I was in accord with keeping it at four years provided it could be done, and I think every officer felt that way about it, provided it could be done; but we were face to face with the conviction of a shortage of officers, which meant continued lack of efficiency in the field due to that shortage, and I think they all agreed that we should have it reduced to three years. At any rate I know that the Chief of Naval Operations said that he believed it, and the Superintendent of the Naval Academy, Admiral Eberle, believed it, and I felt it was so important that I talked with the Secretary time and again about it, but he said he did not believe it, he did not want it.

The CHAIRMAN. This was immediately preceding the war?

Capt. PALMER. That was when I first started in. This was to get officers for the three-year building program on a peace basis, in order to make the program a live one. I think I mentioned that in my first annual report of October 10, 1916. On page 4 of that report I said:

For this reason—

That is the great shortage of officers—

further action is now necessary by Congress to make the completed program a live one.

And I stressed in that and in the memorandum to the department the need for officers. That was really much more important than the need for men, because it takes so much more time to train an officer; and I stated that the output of the Naval Academy should be doubled for a limited period, returning to normal conditions when the shortage of officers had been made up.

I further stated:

As the definite recommendation in this report the bureau recommends that the appointments allowed each Senator and each Member of the House of Representatives be increased, that the course at the Naval Academy be reduced to three years until the shortage is made up, and that the present first class be graduated on April 1, 1917.

You see that was a measure that was necessary in my mind, and in the minds of the officers who were attached to the department at that time, in order to prepare for our three-year building program that Congress had given us. I said:

This step is of primary importance in order to properly meet the wishes of Congress to provide an efficient first arm of defense as expressed in the large program provided in the recent bill.

That was my statement in my regular annual report, October 10, 1916.

The Secretary was against that. He was against the reduction of the course. He was looking along the educator's line, which was quite right for him to do, and I was looking along the line of the needs of the Navy, and it was a question which was the right step.

I did not want the young officers from the academy to come out in a half-baked condition, so before I put this proposition up I got the superintendent of the Naval Academy to go over this thing, he being the chief educator, and I got him to tell me what he thought of it. He drew up a course and said that by modifying certain of the things and speeding up during certain parts of the year he could do it; and also, since the war was coming on, he felt perfectly confident that the increased incentive of war would make the midshipmen work hard enough to get away with a four-year course in three years, which was actually the case.

Digitized by Google

In addition we had precedents in regard to that. Several classes had been graduated before their time, and I got a list of the officers, taken at random, who had been graduates of those classes, as an argument to show the Secretary that we still could get good officers when it was necessary to take a strenuous step and reduce the length of the course for any purpose, and that I regarded this time as very much more important than previous times. I got a list of those officers, and I had it ready for the Senate committee. There were five from each class for instance, taken at random, and the Secretary's aid happened to be one of them at the time, a very able officer, and the others were all about the same.

I took this thing up again in my hearings before the House Naval Committee on December 5, 1916, and again as appears in the printed hearings before the Senate committee on February 20, 1917. On February 20, the time of February 1, when I wanted these officers graduated, had already passed, and as the war clouds seemed to be approaching very much nearer, it was still more important to get them out, because we were so short of officers to start the war.

The CHAIRMAN. When was the length of the course finally reduced?

Capt. PALMER. The Secretary said that he did not agree with it, and he would never listen to it. I told him Admiral Benson was for it and Admiral Eberle, and that practically all the officers who had been talking on the subject were for it. He said, "Well, I am not for it," and he would not listen to further argument about the needs as far as the Navy was concerned. I think he was just wedded to the educational value of the four-years' course, and I think it was quite right for him to be so in ordinary times; but when I went before the Senate committee they put it in the bill, and when the Secretary saw it incorporated in the bill, he said that that was dead against his ideas, and that I should not have gone down to the Senate committee on that.

The CHAIRMAN. That was February 20?

Capt. PALMER. Yes. I told the Secretary that I had authority from him to go; that I had one not down without the authority, which he had given for the chiefs of bureaus to go before the committees and say what they thought was best for the Navy; that I had acted on that authority, and my responsibility in the case, as chief of the bureau only, was such that I ought to present it, and that therefore I did present it. He told me then that he was dead against it, and that he would try to knock it out, and I think it was altered in regard to the number of years that this should stand; but at any rate it gave us a start, and I knew that if we got it started, the break of the war would show that it was absolutely necessary to continue it, even if they had not thought so before. But Congress put it through, and later I remember the Secretary spoke about it in one of his speeches at the academy, or in his talk to the people, and said that these young men had come out and developed in a fine way by this intensive course of three years at the academy.

The CHAIRMAN. If the plan had been adopted in December instead of in February, would you not have had available a certain number of officers in the first part of the war?

Capt. PALMER. Well, no, sir, we would not have had any more officers available the first part of the war if it had been adopted in December, before the war, instead of in February, but we would

Digitized by Google

have had the officers ready, and in training as actual officers afloat on the ships, which the Chief of Naval Operations said must be put in commission before the war, for mobilization. In fact, that was the reason of all our troubles just before the war, that we were not permitted to put in the mobilization plan. Now when I speak of the mobilization plan I do not mean the board matter of mobilizing the interests of the country and so forth, such as they had abroad, but I mean simply that thing that would get the ships together wherever the department wished to have them, wherever the Chief of Naval Operations wanted to have them, and put them on a war organization rather than on a peace organization. To do that meant a good many more officers, and for that reason I wanted to make use of the retired officers, to put them in places where active officers might be withdrawn and sent to sea. I wanted to get them from the War College, I wanted to get them from the post graduate course at the Naval Academy—the post graduate course, not the midshipman course—and I wanted to get that first Naval Academy class, because there were 170 men in it, and when you are very short 170 men go a long way. With those people we could have put the ships in condition as far as our allowance of personnel was concerned, and we would not have been required to shift officers and men from day to day, from one kind of ship to another kind of ship simply because we could not get on the war plan instead of the peace plan. Ships of the reserve force were required to be put in the active organization while active ships were being sent to yards for some purpose, and that meant taking the officers off the active ships.

The CHAIRMAN. Captain, what were your instructions from the department as to sending officers abroad for Admiral Sims's staff?

Capt. PALMER. Admiral Sims had gone abroad, as far as I knew, to get certain information and bring it back to the Navy Department, so they would know what plans to work on. That was my general idea. I do not know whether that was it or not, but at any rate he was under the Chief of Naval Operations and went over as a representative of that office.

The Chief of Naval Operations had told me that he would not have any people under him submitting direct requests for personnel to the bureau. Even some of his assistants and subordinates, when wanting to get a thing through, would say, "Now we must have this," and would come down and talk to us about it and say, "We want to get this officer or that officer." There were a great many requests, and in order to get them together Admiral Benson said, "I am going to issue an order to the people in my office to the effect that all requests for personnel must come through me." So all the requests for personnel from Admiral Sims were sent by cable and letter to Operations or to the department.

We in the bureau were called on by Operations to put 20 ships in commission, 40 trawlers, tugs, 100 Ford boats, merchant vessels, transports, etc., and there were hundreds of things, the armed guard, aviation, etc., and we provided the personnel as best we could for those operations. We did not get an order to send a definite number of people abroad to Admiral Sims, but I knew that he had asked for Capt. Pratt frequently, and I knew that from conversation with the people up in Operations. I heard later—I am not sure that it was not through some of the officers in Opera-

Digitized by Google

tions, possibly through Capt. Pratt himself—he said, "We ought to get some people over there to Sims. Can't you do something for us?" Well, whenever such a request as that came in, we speeded it up and I got the detail officer, who was Capt. Laning, or Commander Baldridge, and asked them what they could do, and invariably they could get people if Operations were willing to give them up from some other activity. At any rate we went as far as we could toward giving them, but the request did not come to us from Admiral Sims, except later on in the war when he sent personal requests, and later in the war also Operations began to send down the carbon copies of those cablegrams. I do not think they were prepared to do that earlier in the war, because, as you may remember, we did not have any clerks and we were scattered all over the city in dozens of places, and I think it was probably very difficult for Operations to have that work just up to date. It got very much better when we supplied them with the yoewomen as clerks, and I think it was after that date that we used to get carbon copies of the cablegrams.

The CHAIRMAN. At substantially what date was that?

Capt. PALMER. I think it was somewhere along in the latter part of 1917, but we did not get any orders from Operations to send the people over, except when they definitely said, "We want such and such a person sent," and then we always sent him. I know that Admiral Sims asked by name for a good many people from Admiral Benson's office, but Admiral Benson felt that it was necessary to keep them there. I remember Admiral Sims later asked by name for an officer in my office, and I did not let him go. I thought it was best to keep him in my office, because he was in charge of an important work from my viewpoint—that is, the supplying of the personnel on the big expansion that was required. But later on this officer went over and the Chief of Naval Operations sent several of his officers over to Admiral Sims.

I am not very clear about any of the dates there, because I have not kept any files. When I left the bureau in October, 1918, I did not take any files with me. My recollection is that later on he got the officers that he required and also the enlisted men that he required.

As far as enlisted men were concerned, the department was not responsible for his not getting enlisted men. I was responsible for that. I did not know that he had not gotten the number of enlisted men until it was brought out here the other day, and I was told I would be questioned on that. We got the enlisted men to him as far as we could get them trained, with the kind of a start we had, and I do know that the reserve and enlisted men for the destroyers who went to Queenstown were sent as soon as they possibly could have been sent, with all the activities that the Chief of Naval Operations directed us to perform in putting ships in commission from day to day. With all those activities it required a great many enlisted men, so that they could not be gotten together and trained in time. All this had to do with things before the war, preparation, training stations, etc. But at any rate, when the enlisted men got over there I know that they did not have the barracks ready for the number we sent. However, that is so only——

The CHAIRMAN. But so far as it was concerned during the first months of the war, when Admiral Sims was calling for officers on the

Digitized by Google

other side, so far as the Bureau of Navigation was concerned, if the Bureau of Operations had been willing to send them over, you could have provided the men?

Capt. PALMER. We could have provided them by taking them from other activities, provided Operations said, "You can do so." They were to decide which were the most important activities; and I think Operations at that time decided, "We can not afford to take these men from these places."

The CHAIRMAN. You say, however, there was one officer sent over?

Capt. PALMER. Yes; Lieut. Commander Daniels—now Commander Daniels. I noticed in reading Admiral Sims' statement, that he was sent there on April 30. Our detail officer in Operations came to us one day, and he said, "I was just up in Operations, and I saw a cablegram from Sims asking for Daniels, and I have already ordered him, and if Operations asks you about this, you can say he is already ordered and on his way." That was Commander Daniels. He was to be sent over as an aide, and he did go over with the destroyers. Of course, in a good many of those cases it was difficult to get space in vessels to send officers and men, but Commander Daniels did go there very early in the game. I think Admiral Sims's testimony shows that he received word on April 30 that Daniels had been sent; and then the detail officer also picked up an officer from the mine force, Davis, I think it was, a radio officer or communication officer; he picked him up out of the mine force at the same time, and they made use of him over there. I think they made use of him at Queenstown. An officer was free, for instance, temporarily; Commander Daniels was just temporarily free, and then we would hear something about that Sims had said that he wanted some officers, and we would take one of those that was available, without saying anything to anybody. If I had taken that up to Operations, they would have said, "Certainly; send him if you can." When the second batch of destroyers went over we sent five officers that they could use with the destroyers. As far as the personnel was concerned, we had, I think, about as fine a personnel as it was possible to have. They had the pick, when they went over there. They had five regular officers, and a trained crew. This number was greater than the number of regular officers that the British had in their destroyers, according to the statements that were brought back. In fact, we got word that the majority of the British destroyers had but two regular officers, at the most, and that the others were made up of reserves. So that my impression is that our personnel over there was as fine as it could be, and that we did not have a great fund of regular officers to put over as a reserve, for any of the activities, because we started initially with 2,100 total line officers, and they had to expand to ten times, so that you can see one officer had to fill the place of 10.

The CHAIRMAN. What instructions did you get from the department about not permitting enrollments or promotions on the other side?

Capt. PALMER. Well, there was an order for no enrollments on the other side, and I am generally in accord with that idea. That is, I did not think that we should go over there and take any one who happened to offer himself. The idea was that we here on this side had all the real personnel there was available, and we could send it over as soon as practicable, as soon as it had some training; but

Digitized by Google

there were other considerations. The department took the stand right at first that we should not have any enrollments abroad, and I think that general stand was good. But then came the request for definite numbers of people. "We must have them for this and that, because we have not any regular officers right here." We kept getting those requests. I did not get those requests; they did not come to me until a good deal later, because all of the personnel business went to Operations, and I do not remember just whether Operations took that up or not, or whether they knew the department had laid down the general policy that there should be no enrollments abroad and took no steps along that line.

For instance, when they had the investigation as to what the department had done in regard to giving Admiral Sims the proper backing up in personnel abroad I was called before that committee, and they asked me if I knew that Sims did not have the personnel that he asked for. This was before the House Naval Investigating Committee in 1917, the latter part of the year. I told the committee there that I did not know about that, for all the orders about personnel came to Operations; but that I had received a letter from Admiral Sims shortly before that, saying that as far as he was concerned, the bureau was doing very satisfactory work. He did not mention his shortage to me; but of course it was quite proper for him to send his recommendations to his chief direct.

At that time I did not know that the department had sent a telegram to Admiral Sims asking him about what was the condition of his personnel, and I did not know that the reply came from him to the department. I did not know anything about that until I saw that in the hearings the other day. Although that was a personnel subject it did not come to me. Admiral Sims either wrote me or wrote to Capt. Pratt, and Capt. Pratt told me, or some armed guard told me, that he was just in the most urgent need for six decoding officers in his place at London. I am rather inclined to think that Capt. Pratt told me about it, but I am not sure, because he often mentioned the fact that we had better send so and so over to Sims, and in every case where we had the authority to do it we did it. At any rate, we had the order out about enrollments, and the Secretary did not want to enroll anybody abroad, and even in that case—so that later on another letter came over about it, and then I decided, as I told the Secretary a few days ago, that it was a necessity, and I gave an armed guard officer the necessary enrollment blanks not only for the 6 that Admiral Sims asked for, but for 12, because I thought maybe he might want to open it up a little bit more. But the general principle of enrollments abroad still existed, and I think the general principle was right; but I think it was also right that we should send over a few when he made that urgent appeal for the particular thing.

The CHAIRMAN. You did send over enrollment blanks, so that he could enroll them on the other side?

Capt. PALMER. They were enrolled.

The CHAIRMAN. And that was not under the orders of the Secretary of the Navy?

Capt. PALMER. No, sir. Now, about promotions abroad.

The CHAIRMAN. How about promotions abroad?

Digitized by Google

Capt. PALMER. The promotions abroad the department is not responsible for. I am responsible for those—or the lack of promotions. I had charge of the personnel and I got requests from all officers in all these important operations that we had, in all parts of the world and of the country, and in each case they had most urgent need for officers and trained officers; all of them had that; so that I had to size up the situation and consider all the requests. And then each officer thought that the people closest to him were the best officers concerned, and I think they were, from each man's viewpoint. I thought I had the only officers in the Navy in my bureau, and I wanted to make them all admirals, and I think everybody felt that way about it, and the only reason they felt that way was because all officers were doing just wonderful work against odds. It was not any one-person-win-the-war business; it was the whole business working as a team.

About the reserve officers, the reserve law, as I have said, was a difficult thing to interpret, and things did not get along for a considerable length of time. We had no persons in the different districts to enroll these people; so that, for instance, their records giving the enlistments were months behind at the beginning of the war. We did not have officers there to do it. And the promotion business, of course, came up not immediately but later on, and I think we could have done better in promotions. I think that I could; that is, not "we." I think I could have done better in promotions if I had started in a little earlier, but I had a good many calls for a little more important things than promotions, and the promotions in classes 1, 2, and 3, which took in a great number of the men of the reserve forces, were approved by all concerned—both sides.

The only other classes were class 4, who were coast defense people, off-shore duty, really, and class 5, for flying officers.

As for the coast defense people, it was necessary for us to adopt at headquarters a plan for promotions and not allow any particular person or force in any place to establish a plan, and I think that is the proper thing to do now. I may be wrong, but I think headquarters should adopt that, so that all forces would get an equal chance, and promotions should not be made on various bases. I do not believe there is much comment about the fourth class either.

But about the flying corps, Admiral Sims made a recommendation of 16 officers. I think he mentioned at that time two of them who had injured German planes, and one of them who had done just as active service, but had not quite accomplished what he was intended to do, through no fault of his own, and I have forgotten why the others were. Some of them, I think, were for advancement so that they could be in a better administrative position. But all of those men were very young, and I did not get out a good plan of promotion for them until along in July, 1918. You will remember that a great many of them were not in the war very long at that time, and that promotion was really a secondary thing, from my viewpoint, at that time, and I felt that as we would get along towards the end of the war a great stress should be placed on that, so that we would give all those people their just dues before they left the service. I did work out a plan of promotion for class five officers, which were very young officers in aviation, and I only made it out because they were all very young, and it would give them something

Digitized by Google

to look forward to. That plan was for more raipd promotion than came to any other class, but it was not in active operation early in the war nor in the middle of the war. It was only late in the war that that plan was in active operation.

And the principal thing, I think, Admiral Sims desired was to be able to give the men promotion on the field, as he spoke of. If a man does an heroic thing—brings down a plane or something of the kind—to give him promotion on the field. I admit that that is a good viewpoint, but mine was different, and the department was not responsible for this. I felt that knowing the conditions abroad and the number of heroic acts that were being done day after day, and the number of men that had brought down 5, 10, and 20 machines, actually to their credit, and were still either enlisted men or young officers, the principle of promotion for heroic deeds was not the proper one; that promotion to a higher grade should be for qualified services in that grade after comparison with other officers, and not for special heroic duties. We can find a great many men who are very heroic, but have no ability beyond that. So that I felt that if we promoted a man on the field for an act of heroism of that kind, we might have to promote him the next week for an act really as brave, and lots of the men were doing that week after week, and our total limit of promotions was to the rank of lieutenant commander. I thought that recognition should have been given by appropriate medals, or if the medals were not available, by letters of appreciation until such time as the medals could be given. So that, on that subject of promotion, the department is not responsible. I am responsible.

The CHAIRMAN. I think that Admiral Sims's testimony will show his officers had very low rank who were connected with his staff.

Capt. PALMER. Yes.

The CHAIRMAN. In order that they might have proper rank in dealing with——

Capt. PALMER. Foreigners.

The CHAIRMAN (continuing). Officers of similar positions of the Allies.

Capt. PALMER. Well, that was very much discussed at the time between officers in all services. Our limits, you see, were lieutenant commander, and during the first year of the war we were allowed only lieutenants in the reserve. Lieutenant commander was then given, a rank which would correspond to the most expert duties of a man along certain lines. I remember, for instance, it was given by Mr. Daniels to Mr. Vandyke, for instance—lieutenant commander. And then for administrative people all along. And Mr. Daniels gave it to Mr. Osborn, whom he had in charge of the naval prison, because he considered him the foremost in his line; and that was the idea of the lieutenant commander's rank—to give it to the leading men. As to the value of rank with the foreigners, it is really an important thing; but you could see that our officers—commanders, ensigns, and lieutenants—were conferring all the time with people like captains and admirals in foreign navies, and we could never hope to get up to anything like that, because the law of Congress would not permit it beyond lieutenants, and not until the last half of the war to lieutenant commanders. They had the same trouble here in the bureaus; but the ranks were apportioned in accordance with the ability of the people to carry out certain technical duties. That point was brought

Digitized by Google

out when the bureaus came to the Secretary and asked for technical men of certain ranks in the bureaus. That was just before the war and in the early months of the war.

They said they were at their wits' end to get the proper people because they did not have any officers, and they could get very valuable men on the outside who were worth $10,000 or more, and get them to come into the Navy with the rank of lieutenant commander, which called for a pay, I think, of $3,000 a year plus allowances, and they could get in that way men that they could not possibly buy outside for from $7,000 a year up. In fact, I remember that one particular bureau, that of Construction and Repair, made an estimate of the men that they really needed of that kind in the early part of the war, in the first months of the war, and they showed that they needed approximately 70 or 80 high-class men at a total cost per year of $350,000, whom they could get just by giving them ranks of the grade of lieutenant commander at $3,000 and lieutenants at $2,400, etc. They showed that it would be a great saving. But the Secretary did not want to let them in. He said he did not want anybody but seagoing people to come in the department. Of course seagoing people could not do that business, and we did not have the seagoing people in the country. That was one bureau that submitted that request, and they also said that if the war kept on they would need a much greater expansion. Now, I do know that all the bureaus got together, time after time again, with the Secretary, and urged the great necessity for these technical men to give them a little rank, and therefore get them, because they knew that they were going to all sorts of other organizations, in the Army and other big organizations, everywhere, and that they would be lost to us unless we got our percentage at the time; but we never got them except in a few cases. I know, for instance, in the Bureau of Construction and Repair they wanted to have 70 or 80 of these high-class men, and they got only a few, later on, after a great delay.

The CHAIRMAN. Now, Captain, can you tell me what plan of operations was given you by the department, or by the Chief of Naval Operations, on which to base in logical manner your general future assignment of personnel to different forces?

Capt. PALMER. I did not quite understand the question.

The CHAIRMAN. What plan of operations, if any, was given to you by the department or the Chief of Naval Operations on which to base your assignments, your general future assignments, of personnel in a logical manner, to different forces?

Capt. PALMER. Oh, well, we had no plan. We had only a mobilization sheet which was a sheet stating the vessels which would be required for mobilization. That was gotten up by the Office of Naval Operations, but we had no definite plan on which to base future assignments. I could not go on the plan that we were going to go into a battleship warfare or a submarine warfare or anything of the kind. I could not look far enough ahead and specialize on those people both as regards numbers and duties; but I did receive from Operations from time to time—they said "We will have to take away 10 ships here probably within a month"; or the next day it might be, "We must have trawlers"; probably had to have 20 or 40 trawlers. And another time it would be, "We are going to undertake this mine force business now, and we want to have the

Digitized by Google

vessels ready on a certain date." Of course the mine force is a very large organization, and the transport force was another that was a very large organization; the ships that we required to take over the Army, and later to bring the Army back. I must say they were a fine lot, too. The Navy takes off its hat to the Army on the kind of men they sent over there, and the way they looked and the way they acted. They were splendid. We had various calls of that kind from time to time, and in each case, when I would say, "When are these to be ready," they would say, "Oh, we want them now, or just as soon as you can possibly get them; in fact, in a month or two months." Just ordinarily the training of any people, enrolling them, and so forth, and getting barracks ready for them, nothing can be done in two months to speak of.

The CHAIRMAN. But was there any general plan in the department under which all the bureaus could cooperate together, and which was to be followed out throughout?

Capt. PALMER. Not that I know of, sir. Not in my bureau. We did not get anything of that kind. In fact, we had simply that thing from the general board which said that we should be prepared to furnish in a week after the order the personnel. Well, that was not any plan. I understood, though, that a plan was being prepared in Operations, and I went up and asked for it several times—that is, an estimate of the situation and what we were going to do, because it was very valuable for me to have such a plan so that I could place the personnel in a logical way, and endeavor to train them; but I was told that there was a plan in process; that they were getting one at that time. That was just before the war. And I heard again that it was being drawn up during the first months of the war. But I did not get that plan. I do not know whether it was actually gotten out or not; but I understand that the thing that affected personnel was some letter, which I think was mentioned in Capt. Laning's hearing yesterday, some letter about personnel which showed the priorities of ships in July or August; that is, which ships were to have the call for personnel; that is, whether they were to be battleships or destroyers.

The CHAIRMAN. Did you get any orders about priority of ships?

Capt. PALMER. Not until that time.

The CHAIRMAN. What time was that?

Capt. PALMER. I do not remember what date that was. It was July or August.

The CHAIRMAN. 1918?

Capt. PALMER. No, sir; 1917.

The CHAIRMAN. 1917?

Capt. PALMER. Yes, sir. But, of course, that was not the kind of plan we could go on in personnel. We had already established our own priorities. Since I found that there was not any plan such as I expected them to have; that is, I had been led to believe from the War College course up there—which I have not had the opportunity to take yet, but I had been led to believe—that each thing would generally have a plan drawn up for the particular situation which existed at the time, and say what you are to do, "Each force is to prepare this and prepare that," and so I thought there would be such a plan. But when I found that there was not, and we could not get a definite order of the kind, I went ahead and

Digitized by Google

made my plan. To be sure, that is not a very good way to do, because I did not have the information which should have been had before you tried to work out any plan. I established my own priorities on vessels, but that really was a very small part of it. In fact, we established the priorities which the department got out in that letter, later on, of July and August. But I remember one particular point was, I wanted to know enough about the war to decide whether I could make use of personnel on battleships to train other personnel. Of course, we were short on personnel right at the start, and I asked Operations if they could give me any probable date before which our battleships would not be actively required in the war area for actual fighting, and I was told they could not. Then I asked, "Can you give me six months?" "No." Just in general, they did not feel justified in saying, "Well, you can go on the plan that they will not go in action for six months, or one month." There was the cry always to have the battleships ready for anything; and, of course, if they were to be ready for anything they could not, of course, take people off of them to train others; so that I worked out in my own bureau, with my own planning section in the bureau, a scheme for making use of the officers that we had, and in order to do that I had to establish some definite propositions, one of which was, I made the assumption that the battleships of the active fleet would not be required to take active part in the actual operations of the war zone within six months at least.

Of course that was a decision which was made without adequate information. It just happened that they were not called in that time; but I had to adopt something, so that I took that plan and then decided to take off 6 officers from the 36 or 34 out of the actual battleships, and then put them in to train other people for the enormous expansion in the other activities. In fact, the battleships were training people all the time. Every ship afloat was a training ship, including the destroyers afterwards on the other side. But this thing of taking 10 officers off of the battleships when they considered that they did not have enough officers, was a very important step, and I would not have been able to do it at all if I had not communicated with Admiral Mayo and gotten his cooperation. He took a remarkable view of the situation, and I think it shows just what type of man he is. I explained to him what I thought were the probable duties and the great expansion we needed for forces everywhere, and he would have been perfectly justified in saying, "Well I am in command of the battleships of the Atlantic Fleet, and we are short of personnel, and I am going to keep them"; and I believe if he had taken that stand I could not have gotten them. But he sized up the whole situation from a broad viewpoint, and he said, "I hate to do it, but I think it is not best for me, for my battleships, but it is best for the way we have got to win this war." So that, off came the officers, one at a time: and the captains rightfully objected. I think I would have made a great deal more objection than any one of them did; and they did object and persisted in their objections, but at the same time they went to the job. They said, "Well, it is an order, and we will deliver the goods"; and they did. Of course that was a step that I had to take on the assumption that

Digitized by Google

we would not have them in the war for six months. If they had gone to war in two months, I mean if they had—not gone to war but had gone over on the other side and been put in battle in two months—my assumption would have been wrong and I would then have gotten what I deserved.

The CHAIRMAN. Then you do not know of any definite plan of procedure in the conduct of this particular war, worked out and given to you, on which your bureau could make complete preparations to proceed logically with the personnel?

Capt. PALMER. I do not.

The CHAIRMAN. That is all. Senator Keyes, have you any questions?

Senator KEYES. None.

The CHAIRMAN. Senator Trammell?

Senator TRAMMELL. In January, 1917, Captain, was the regular Navy enlisted up to its full strength?

Capt. PALMER. No, sir.

Senator TRAMMELL. You were carrying on enlistments and making enrollments in the Regular Navy and also in the reserve, then?

Capt. PALMER. We were going ahead with enlistments just as fast as we could do it.

Senator TRAMMELL. Both in the Regular Navy and in the reserves?

Capt. PALMER. Up to the latter part of January we were doing it in the reserves, but in the latter part of January the Secretary stopped the enrollments. Up to that time—we had just gotten the reserve organization on its feet and were about to get things started, and were just beginning to deliver the goods then. But the regular enlisted men, we forged right ahead on them, right up to the time of the war.

Senator TRAMMELL. At the time the Secretary stopped the enlisting in the reserves, was the Regular Navy enlisted up to its full strength?

Capt. PALMER. No, sir; not by any means.

Senator TRAMMELL. It was not?

Capt. PALMER. No, sir.

Senator TRAMMELL. I believe you stated there was some difficulty in making enlistments up to the time that it was very apparent that we were very likely to go into war?

Capt. PALMER. Yes, sir; there was a good deal of difficulty in that. I remember the Secretary was very anxious about those enlistments at the time and so were the members of the House Naval Committee, before which I was called on that subject, and they offered all sorts of suggestions in order to aid enlistments. I had the organization going then, had divided the country into four districts with four inspectors in charge, and had the various people go into a very hearty campaign with the assistance of the organizations that I have told you of, and it took some time to get at the fathers and mothers of the boys that we wanted to get in and explain the thing. We went to the outlying districts to get them, and, in fact, we asked for little Ford automobiles to have in each recruiting station, so that we could get the boys we wanted most—that is, the country boys. We asked for an appropriation of $21,600, but by some accident that was approved, except the $21,600. That, however, I would say did not delay us.

Digitized by Google

Senator TRAMMELL. You failed to get an appropriation?

Capt. PALMER. Yes.

Senator TRAMMELL. For the purpose of carrying on the enlistments?

Capt. PALMER. Yes. That did not delay us, though. We were going ahead with enlistments, and Mr. Daniels was very anxious we should go ahead. He would call me in sometimes and say, "Can we do anything more towards getting the enlisted men?" I always told him no, except to put retired officers in charge of the stations.

Senator TRAMMELL. Along about the time in January when he ordered the discontinuation of enlisting in the reserve, was he encouraging the idea of enlistments in the Regular Navy, or was he also against that?

Capt. PALMER. No, sir; he was not against enlistments in the Regular Navy. He was for it.

Senator TRAMMELL. He wanted all possible enlisted in the Regular Navy, and the Regular Navy was not enlisted up to its full strength at that time?

Capt. PALMER. No, sir. The idea was, of course, that the reserves would go in for the war period, as the other people would not come in except for four years, but the reserves would come in for the war period, and therefore we could get an enormous number of those if we would just try for them.

Senator TRAMMELL. After the draft law was enacted was there any question then about continuing or discontinuing enlistments in the reserves?

Capt. PALMER. After the law was passed?

Senator TRAMMELL. Yes; after the draft law was passed.

Capt. PALMER. When the draft law actually came into operation we had to do away with the reserves altogether then, but that was very much later in the war.

Senator TRAMMELL. Yes; that was some time later. It was my recollection that there was some conflict, possibly, and they felt that they had to shut them off in order to keep some of them from not going into the Army under the draft. They wanted to go into the reserves.

Capt. PALMER. Yes; we actually did shut them off then, but we did not want them to go in at that time.

Senator TRAMMELL. Yes.

Capt. PALMER. But by that time we had a very considerable number of reserves. We had gone ahead and enrolled them so that we would have the people along these special lines; so that we would have these various kinds and classes of people. It was very easy to get any kind of man and take him in from the draft, but we did not want men that were uneducated—not well educated but illiterate—put in charge of these important things at sea.

Senator TRAMMELL. You had charge of the personnel. Did you provide the necessary men for manning the ships and destroyers and for other duties as they were required?

Capt. PALMER. I had the personnel actually ready at the seaports to be put on vessels before the vessels were ready. We never had a delay of a vessel on account of not having the officers and men, but I will not say that they were very highly trained, because with a very short war such as we had and with the ordinary idea that it takes

Digitized by Google

about two years to train a recruit so that he will an ordinary man-of-war's man, and 10 years to train officers, you can see that we did not have any more trained men than we had in the beginning.

Senator TRAMMELL. You provided them and they had at least sufficient training to meet the situation?

Capt. PALMER. To get the ships going. I do not mean that they would meet the situation in the most efficient way, by any means, but they were the best under the circumstances, with the amount of time given for training. They trained them intensively at all these places, and they did very fine work.

Senator TRAMMELL. The point I wanted to get at was, were they sufficiently trained and equipped to get the desired results?

Capt. PALMER. It would be pretty hard to tell, Senator. I know that in specific cases we had people—for instance, Admiral Sims said that a certain bunch he had on little yachts or trawlers, I have forgotten which, over on the French coast, were very inefficient; and I think he used the words, "Their inefficiency was deplorable." I have forgotten whether it was on yachts or trawlers; some small vessels. But, at any rate, I would not be sure that he was not correct in that. I do not know about the actual adjectives in the case, but I think there were a good many cases where there was a good deal of inefficiency among the organizations, that is, I mean among the individuals in organizations.

Senator TRAMMELL. As a matter of fact, would not that apply to people in the regular Navy? Would it not apply to some particular individual connected with any man's staff? Some particular individual connected with your bureau, for instance, might not measure up to the highest standard?

Capt. PALMER. I will agree with you on all except my bureau. [Laughter.]

Senator TRAMMELL. That is what I thought.

Capt. PALMER. Oh, yes——

Senator TRAMMELL. I did not mean to reflect on anybody, but human nature and the frailties of human nature and the accomplishments and achievements of human nature run throughout the Navy just as through any ordinary, everyday bunch of men; that is the point I am making.

Capt. PALMER. That is exactly right.

Senator TRAMMELL. But the broader point is, taking it as a whole, did not the men that you provided accomplish results?

Capt. PALMER. I should say that the results accomplished by the Navy were perfectly wonderful during this war. I would say that they were accomplished in spite of the obstacle of not having people to start with, and having a short time to train, and their newness in the war. I think the results were wonderful.

Senator TRAMMELL. That is my opinion. I would not pick out some isolated case of some fellow that made a failure, and cite it as the precedent for the Navy or for the reserve forces.

Capt. PALMER. No, sir.

Senator TRAMMELL. I would take it into consideration as a whole.

Capt. PALMER. I know what a fine showing our battleships, for instance, and our destroyers, made. In fact, all the comments we have seen in the papers and in books, bear that out; and Admiral

Digitized by Google

Sims, for instance, speaks of the wonderful lot of men we had on our destroyers, and that they were ready for anything. Also Admiral Rodman says about his people in the battleship force in the North Sea; and I know we have occupied a very high position with the British Grand Fleet. I could mention also the mine forces; I could go on and name all the forces.

Senator TRAMMELL. I believe you stated you began to take measures looking to the enlargement of the Navy, and looking toward preparation of the Navy, very shortly after you went into the Bureau of Navigation office in 1916, did you not?

Capt. PALMER. Yes, sir; I undertook activities; I undertook to prepare. Yes, sir; I did.

Senator TRAMMEL. Was that restricted alone to the bureau with which you were connected or did that same activity go in the Bureau of Operations, or Operations, I believe you call it?

Capt. PALMER. Yes, sir. Senator, I do not want to put in anything about anything out of my own bailiwick. I could only give opinions so far as anything else is concerned. I know that Admiral Benson and his associates stated to me, "We know this is a big job so far as personnel is concerned because we have not any to start with, but we would like to help you." That was the attitude of Admiral Benson and all his officers, and I must say that they helped us, and if the Bureau of Navigation did any good work, it was because the Bureau of Operations helped.

Senator TRAMMEL. I presume in providing personnel and trying to equip the men to meet the situation, that you would not have been doing that if the Operations had not been making some preparation to provide additional craft for the utilization of those men. It would have been the merest folly to have been doing that?

Capt. PALMER. No, sir; I would not have made any preparation unless I had some data on which to go about the number of ships. They had a mobilization sheet on which I worked.

Senator TRAMMEL. They did have a mobilization sheet on which you worked?

Capt. PALMER. Yes, sir. That was providing for vessels that we then had, not with regard to my future operations of supplying men to the regular vessels in the Navy, the kinds that would be with them and say those would be with them in the mobilization. Of course we had the men ready so far as the mobilization was concerned when the vessels were ready. In fact some of our greatest troubles at the training stations were because we could not send men that we had away and put them on the ships on the mobilization dates, because the ships were not ready, a certain number of them, so we had the training stations congested and that meant there was difficulty in handling those men and getting them properly housed.

Senator TRAMMELL. It is very evident from your testimony that you had sufficient information on which to equip as best you could in the short length of time a sufficient number of men to meet the requirements upon different vessels and in other different places where personnel was required, at the time that it was required?

Capt. PALMER. Yes.

Senator TRAMMELL. You had sufficient information to do that because you did that.

Digitized by Google

Capt. PALMER. I had sufficient information, not in regard to the details of them, but I went on and worked the Navy to the full; getting all officers and all men of all kinds as soon as I could.

Senator TRAMMELL. Now, there has been more or less said about the question of the general plan. What if a general plan for entering the war and carrying out the conduct of the war so far as we were concerned had been made in January, 1916? Would the subsequent developments during the war have justified the carrying out of that plan in detail?

Capt. PALMER. I should say that any plan of the kind would have had to be modified here and there, but I should say also that a plan might have been made looking toward, for instance what the character of the war was from the information that could have been accumulated from the two previous years that the foreign countries were at war.

Senator TRAMMELL. Do you not think that those things were taken into consideration in the manner of making preparation in the way of ships and different equipment and also in the question of mobilizing the personnel? Do you not think that that had something to do with it?

Capt. PALMER. That plan that they had?

Senator TRAMMELL. That was an element of consideration?

Capt. PALMER. Well, I should think so; but, of course I did not get the benefit of any of that because my instructions from operations were from day to day, "We think we are going to do this," and the next day or the next week, "We have to shift from this to that." For instance, they would say, "Here, we want so many regular officers, aviators on these ships, or we want armed guards, and we want to provide for two of the new ships, and for the armed guards crews on them," and the next time would be the establishment of a patrol force, and really nothing I could go on as to picking up the kind of men or doing anything——

Senator TRAMMELL. Do you not think that the developments as they were developing rapidly day by day would have a great deal to do with it?

Capt. PALMER. Very much.

Senator TRAMMELL. You spoke of the armed guards. It was not until February that Germany declared that there was going to be an unrestricted submarine campaign.

Capt. PALMER. That could not have been foreseen.

Senator TRAMMELL. That could not have been foreseen, and no definite policy could have been formed, when the Germans did not adopt the unrestricted submarine policy until February.

Capt. PALMER. The necessity for armed guards came out of a clear sky.

Senator TRAMMELL. The submarine menace did not reach its height until July, 1917.

The CHAIRMAN. April.

Senator TRAMMELL. It did not reach its height until July, 1917, according to the chart filed by Admiral Sims.

The CHAIRMAN. There were 800,000 tons of shipping sunk in April, which was the highest number.

Senator TRAMMELL. But its height was not reached until July. There might have been a greater number at some previous time, but

Digitized by Google

the number did not begin to fall off until after July 1. I am going by the chart filed by Admiral Sims. I do not know whether it is correct or not. I presume that it is reasonably so. So a general plan that might have been made in December, 1916, or January, 1917, might have proved totally inadequate to have met the situation as it developed?

Capt. PALMER. It might.

Senator TRAMMELL. Was there such delay on the part of the Navy in performing its part of the war after we entered the war as to prolong the war for any great length of time, in your opinion?

Capt. PALMER. Well, it would be just an opinion. I do not know how much it prolonged the war. I should say—I can give an opinion only as far as my personnel is concerned, I mean that it would be the only thing I am qualified to talk on—I should say that all those delays we had were simply due to postponement—well, I guess "procrastination" would be the word—and when I found things could not be done after taking every step I could, I went ahead and provided a personnel so we did not really have many delays, as far as personnel was concerned, on winning the war, on the total thing. I would not say that we had a week's delay or a month's delay as far as the Bureau of Navigation was concerned. But I do not know about the general plan.

Senator TRAMMELL. I believe you stated that you did begin preparations in 1916 to enlarge and increase the efficiency and strength of the Navy?

Capt. PALMER. Yes, sir.

Senator TRAMMELL. Congress passed a law in August, 1916, providing for a considerable increase, did it not?

Capt. PALMER. August 29 they passed a splendid bill, a slpendid act.

Senator TRAMMELL. Do you know whether or not the Secretary of the Navy was in sympathy with that measure?

Capt. PALMER. I think he was fully in sympathy with that measure. It is my impression. I would not like to speak for him, but I think he was fully in sympathy with it.

The CHAIRMAN. I think that is all, Capt. Palmer. You may be excused.

(Thereupon at 12.45 o'clock p. m. the subcommittee adjourned until to-morrow, Friday, March 26, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

FRIDAY, MARCH 26, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a.m. in Room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Keyes, and Trammell.

The CHAIRMAN. The committee will come to order. Capt. Taussig, will you take the stand?

TESTIMONY OF CAPT. J. K. TAUSSIG, UNITED STATES NAVY.

(The witness was sworn by the chairman.)

The CHAIRMAN. Capt. Taussig, can you give the committee any information as to the steps that were taken by the Navy Department in preparing and conducting activities in the recent war, and especially with regard to the personnel of the Navy and the destroyer situation, and will you please state what duties you performed from the beginning of the World War in 1914 up to the present time, showing your facilities for observation, and stating in your own way your observations of any matters pertinent to this investigation?

Capt. TAUSSIG. I will, sir. I have a prepared statement which, with the permission of the committee, I will present.

The CHAIRMAN. Very well.

Capt. TAUSSIG. The following duty was performed by me just prior to and during the World War:

1. Assistant to officer in charge of enlisted personnel, Bureau of Navigation, Navy Department, from April, 1912, to May, 1915, a period of three years.

2. On duty in connection with and commanding U. S. S. *Wadsworth* from July, 1915, to November, 1917, a period of two and one-half years, of which eight months was after the United States declared war.

3. On duty in connection with and commanding the U. S. S. *Little*, a destroyer, from January, 1918, to August, 1918; eight months during the war.

4. In charge of Enlisted Personnel Division, Bureau of Navigation, Navy Department, from September, 1918, to May, 1919, a period of nine months.

On account of the length of time necessary to educate officers and to recruit and train enlisted men in times of peace, it will be necessary in showing to the committee the state of the naval personnel when this country entered the Great War, and the reasons for its condition at that time, to begin as far back as 1914, when the European conflict began, and when it became practically certain that this country would sooner or later become involved. Unless measures had been taken as early as 1914 to place our personnel on a proper and adequate

Digitized by Google

basis it could not possibly have been done by the time this country declared war, two and a half years later.

It is proposed to show to the committee that, first, from 1914 on, the policy of the department in regard to personnel—and especially the enlisted force—was such that the Navy was far from being ready for war when we became a belligerent; and, second, the result of this unpreparedness on the efficiency of the fleet and especially the destroyers, two of which I commanded during the war.

In 1914, while on duty in the Bureau of Navigation, it was evident, and clearly recognized by the officer in charge of enlisted personnel and myself, his assistant, that the enlisted personnel was entirely inadequate for the proper manning of our already completed ships on a peace basis, and dangerously deficient should we be suddenly thrown into war.

These facts were repeatedly brought to the attention of the Chief of the Bureau of Navigation by Capt. Blakely and myself, and a memorandum prepared showing that to man the ships and stations, even in accordance with the inadequate "peace" complements, the authorized enlisted strength of the Navy was more than 18,000 men short of what was needed.

The inadequacy of the personnel made it impossible to assign proper complements to the ships of the fleet. Not only was it impossible to assign sufficient complements to the ships, but the fact that there was no reserve to call on made it impossible to keep the inadequate assigned complements filled. In fact, if the ships were manned in accordance with the recommendations of the general board and the commander in chief of the Atlantic fleet, the authorized numerical strength of the Navy was such that there would be no naval personnel for about 225 ships carried on the Navy list, and none for any of the shore stations or under training. As, in 1914, the Navy was recruited to the full strength authorized by law, and as new construction was being completed for which additional personnel was needed, the unsatisfactory conditions in regard to personnel were continually growing worse.

One of the worst features caused by the inadequacy of the personnel was the lack of permanency of officers and men on all the ships of the fleet. There were, of necessity, so many and so frequent changes in personnel that the efficiency of all ships was seriously impaired. I will shortly quote from official reports to show that these unsatisfactory conditions actually existed, and continued to exist up to the time that the United States entered the war.

The general board of the Navy, in its 1914 annual report to the Secretary of the Navy recognized that the unsatisfactory personnel conditions greatly impaired the efficiency of the fleet, and made recommendation to the department that an additional 19,600 enlisted men be immediately requested. The Secretary of the Navy did not accept the report of the board with this recommendation, but returned the report to the board, with the request that all mention of a numerical increase be eliminated. This, the board did in order that the other important features of the report be not lost to the public.

I suggest that the facts in regard to that had better be obtained from Admiral Fiske, who was on the general board, and the aid of Operations at the time, if he is to appear as a witness before the committee.

Digitized by Google

The CHAIRMAN. Very well.

Capt. TAUSSIG. The report, in its changed form, was published in the appendix to the annual report of the Secretary of the Navy, 1914, and that part relating to personnel, follows:

39. The general board can not too strongly urge upon the department the necessity of using its best endeavors to carry out the repeated recommendations of the general board, made from year to year, to provide the fleet with a personnel, active list and trained reserve, equal to the manning of the fleet for war.

40. In the opinion of the general board this is a matter of even more serious import than that of construction, for it can not be too often repeated that ships without a trained personnel to man and fight them are useless for the purposes of war. The training needed for the purpose is long and arduous, and can not be done after the outbreak of war. This must have been provided for long previous to the beginning of hostilities; and any ship of the fleet found at the outbreak of war without provision having been made for its manning by officers and men trained for service can be counted as only a useless mass of steel whose existence leads only to a false sense of security.

41. The strength of the fleet is measured too often in the public mind by the number and tonnage of its material units. The real strength of a fleet is a combination of its personnel—with their skill and training—and its material; and of these two elements the more important—the personnel—is too often forgotten and neglected in making provision for our fleet. The general board can not impress this point too strongly on the department and recommend too earnestly that every effort be made to correct it, and that legislation be urged to provide for a personnel on the active list, supplemented by a trained reserve sufficient to man every vessel of the fleet when the call comes.

42. No nation in time of peace keeps all the ships of its navy fully manned and in full commission. But all leading nations except ourselves provide an active list, officers and men sufficient to keep the best of their fleet in full commission, and all the serviceable ships of their fleet in a material condition for war; and in addition a trained reserve of officers and men sufficient to complete the complements and fully man every serviceable ship of their navies, and furnish a reserve for casualties. Thus every nation with which conflict is possible is prepared to mobilize its entire navy, by order, with officers and men trained for service. We alone of the naval powers provide no such reserve, and an active personnel too scant, and trust to the filling of the complements of our ships by untrained men recruited after war is imminent or delcared. To quickly man all of the ships of the Navy serviceable for war (including ships which are now in reserve or ordinary) with trained crews is impossible owing to the absence of a trained reserve.

43. In view of all that has been herein set forth, the general board recommends:

(*a*) That legislation be asked for providing an active personnel, officers and enlisted force, capable of keeping in full commission all battleships under 15 years of age from date of authorization, all destroyers and submarines under 12 years of age from authorization, half of the cruisers and all gunboats, and all the necessary auxiliaries that go with the active fleet; and of furnishing nucleus crews for all ships in the Navy that would be used in time of war, and the necessary men for the training and other shore stations.

(*b*) That the general policy be adopted of expanding the active personnel with the expansion of the fleet in the proportion indicated in (*a*).

(*c*) That immediate steps be taken to form a national naval reserve of trained officers and men, and that this work be pushed until this reserve, in connection with the Naval Militia, has reached the point where, combined with the active list, it will be possible to fully man the entire fleet with war complements and furnish 10 per cent additional for casualties.

(*d*) That the Naval Militia be expanded in number and that the department encourage the continuation and improvement of its training to the end that it may still more efficiently serve to reinforce the regular service at need.

GEORGE DEWEY.

This report in itself shows that the Navy was in a very unsatisfactory state so far as personnel was concerned.

In referring to paragraph 43 (*a*) of the just quoted report of the General Board, which paragraph is the one from which the recommendation for an immediate increase of 19,600 men had been removed, the Secretary stated in his annual report, dated December 1, 1914:

Digitized by Google

By wisely utilizing the present personnel all ships of the classes named can be maintained in full commission without addition to the present enlistment and therefore no legislation is needed to carry out their recommendations. This is clearly shown in a report by the Chief of the Bureau of Navigation, which is printed in the Appendix on page 64.

The figures submitted by the chief of the bureau in this report did not allow for adequate complements for the ships mentioned in the General Board's report, and did not provide for nucleus crews of the other 225 ships of the Navy required manned by the General Board. As the officer in the Bureau of Navigation who actually worked out the details of the enlisted personnel to ships and stations, and as I personally prepared the orders for such details, I know that the personnel as it existed at that time could not be utilized so as to maintain ships as recommended by the General Board.

The General Board had found that in order to carry out its recommendations an immediate increase of 19,600 men of the active Navy was needed.

We in the enlisted personnel division of the Bureau of Navigation who were charged with the administration of the personnel found that the immediate increase should be approximately 19,000 men.

The Secretary requested no additions for the active enlisted force. Consequently, the unsatisfactory personnel situation continued.

While in the Bureau of Navigation, and immediately after leaving the bureau in 1915, I made an exhaustive study of the whole Navy personnel situation. The official records were at my disposal, and I had an experience of three years in the administration of the enlisted personnel force of the entire Navy. This study resulted in my writing in 1915 a paper on the subject of "Naval Personnel."

It was shown in this paper among other things:

1. That the allowed complements of the Navy ships in commission were "peace" complements and were from 15 to 30 per cent less than would be required in time of war.

2. That, in spite of the inadequacy of the peace complements, the ships did not even have these allowed peace numbers on board—the battleships in full commission having an average of 100 vacancies per ship in the enlisted force.

3. That there were 42 ships with only three-tenths of their peace complements on board, 16 ships with only one-tenth of their peace complements on board, 38 ships out of commission with no naval personnel on board. No personnel was available to fill these up.

The CHAIRMAN. Have you a copy of this paper with you?

Capt. TAUSSIG. Yes.

The CHAIRMAN. I would like to have a copy of it inserted in the record.

Capt. TAUSSIG. I have here the only copy extant, one of the orignal copies; but the committee is welcome to have it.

The CHAIRMAN. I would like to have it put in the record. That was an official paper?

Capt. TAUSSIG. No, sir; this paper that I am talking about was not an official paper. It is a study that I made.

The CHAIRMAN. Was it presented to the department?

Capt. TAUSSIG. I mention that later, here. If you will just let me finish this point, then I will bring out just that point about it, which shows its status.

Digitized by Google

The CHAIRMAN. Very well.

Capt. TAUSSIG. The next point is:

4. That there were in the Navy in 1915 a total of 1,920 commissioned line officers and 53,000 enlisted men.

5. That to put what material we had (plus 75 auxiliaries to be immediately purchased) in operation for war there would immediately be required a total of 4,440 line officers and 106,900 enlisted men, which was 2,520 line officers and 53,900 more men than we had in actual service.

6. That the staff corps were correspondingly weak.

7. That after impressing into service all our available organized and unorganized reserves, including the Naval Militia, we would still be short of immediate requirements 1,088 line officers and 29,000 enlisted men.

8. That much additional personnel would be required as the war progressed.

9. That the Naval Reserve Force consisted of only 150 men.

10. That it took considerable time to educate officers and to recruit and train enlisted personnel.

This paper on naval personnel was submitted to and accepted by the Naval Institute for publication. It received "first honorable mention" in the prize essay competition for that year.

In accordance with Navy regulations, the department's authority for publication was requested. The Navy Department refused authority for its publication without giving reasons, and as a result it has never been printed. That answers the question you asked me.

The CHAIRMAN. Yes; that answers my question. I would like to have this paper inserted in the record.

(The document referred to is here printed in full in the record as follows:)

NAVAL PERSONNEL.

Motto: "Historically, good men with poor ships are better than poor men with good ships."

INTRODUCTORY.

The Government of the United States has so neglected the opportunities for placing the country on a proper defensive basis, we are, to-day, in a position which, in the event of war with a first-class power, would be precarious. Our enemy would have sufficient initial advantage to deal us a staggering blow from which our recovery would be slow, and very difficult at the best. While recent events abroad have forced our people to a realization of the country's unpreparedness, there appears to be a general impression that this condition of affairs applies mainly to the inadequacy of the Army personnel, and to the insufficient number of Navy ships. The true situation in regard to the personnel of the Navy has been overlooked. It is evident that the people of this country do not appreciate the necessity for an adequate and efficient naval personnel.

The object of this paper is to discuss only that phase of unpreparedness which relates to the personnel of the Navy. It is realized that all the intricate questions involved can not be thoroughly elucidated, and some can not even be touched on; but it is hoped that by stating the facts, and by making a few observations and suggestions, a better understanding as to what we have, what we need, and what we probably can obtain, will be imparted to those who need enlightenment, and to those who seek it.

That we have an insufficient number of ships, and that those we have are not in the proper proportion as to classes, has, through the medium of the European conflict, become apparent to all. That we have not sufficient personnel to man our insufficient number of ships, and that such personnel as we have are not in the proper proportions as to corps and grades, seems to interest comparatively few. Not only is our personnel

Digitized by Google

inadequate for manning the ships now on the Navy list, but no provisions have been made for supplying the necessary personnel for the vessels under construction, and those recently authorized. The country, through the press, is crying for more ships. The country apparently does not care whether or not the ships are officered and manned. This is certainly a most peculiar state of affairs. That it exists must be due to the fact that the people do not understand the true situation. They do not know the facts. The reason for this ignorance is their lack of interest in personnel matters. To them the ships are everything. They see a division or squadron of ships steam majestically by. Each vessel has the Stars and Stripes displayed at the peak. The onlookers pride themselves on being Americans, and say to one another, "We can lick anything afloat." It is the valor of ignorance. It never occurs to them that these ships have on board only about three-quarters of the personnel necessary to man them properly; that, owing to this lack of personnel, they are not prepared to "lick anything afloat."

This lack of knowledge concerning naval personnel applies not only to the people at large, but also to their Representatives in Congress, and (what is most unfortunate) to the Navy itself. We can rest assured that there is no such lack of knowledge among the naval attachés of the various foreign embassies in Washington.

That the Navy, as a whole, does not appreciate the true situation and does not know the facts, is shown by the conflicting testimony given by those high in authority before the House Naval Committee during the consideration of the last appropriation bill. It was held by some that there was sufficient personnel for all immediate needs. It was held by others that we were short of requirements many hundreds of officers and 18,000 enlisted men. In view of such conflicting opinions, it is not to be wondered at that Congress failed to pass any personnel legislation. So our lack of policy of continuing the building of ships, without making provision for the necessary personnel, remains with us year after year with our present weak personnel as a result. It is hoped that the fallacy of this inane procedure will be realized before it is too late; that the country will awake to a realization of the fact that an unmanned ship is worse than no ship at all, as it requires protection instead of giving it; that a partially manned ship is more or less of a menace in that it would be called on to accomplish what is required of a fully manned ship, with probably disastrous results.

The quality of the personnel has steadily improved. The quantity of the personnel has spasmodically increased until to-day it is numerically greater than ever before. But while this numerical increase has been developing, the material has also increased and at a much more rapid rate than the personnel. Consequently we find ourselves with less personnel in proportion to our material than at any previous time. Even if it were true that "man for man we are as good as other navies," this condition would avail us little if, in case of war, the average must be lowered by the introduction of a large untrained element. Such a contingency confronts us at present. It behooves us to remedy this condition as soon as practicable. It is not sufficient that only in peace times our personnel be as efficient as that of any possible enemy. It is essential that the personnel be in a status where there is every reason to believe we would be as efficient as, or more efficient than, any possible enemy with whom we might be drawn into a war. That our personnel is not on this basis is unfortunately true. In fact the greatest need of our Navy to-day is an adequate and efficient personnel.

Practically all of our personnel legislation has been done piecemeal. The nonexistence of a general staff has resulted in the absence of a progressive program. In appropriating for ships, provision is made for armor, armament, and equipment. Sometimes necessary ammunition is authorized. Never is provision made for manning the ships when completed. This procedure continues year after year until the personnel becomes so inadequate it is imperative that something be done. Then, and not until then, a rider is attached to an appropriation bill providing for a limited increase in the number of men, or relieving some intolerable condition among the officers. The provision for men is always inadequate, as the fact that it takes time to recruit and train men for service on board ship is repeatedly overlooked. As a result, when the additional quota has been recruited and passed through the training courses, we find, owing to the completion of new vessels and the authorization of others, the same unsatisfactory conditions prevailing as existed a few years previously when the additional men were authorized. The relief for unsatisfactory conditions among the officers has usually been temporary in character, as almost without exception, such relief to the officers of one corps or grade, has, in the course of a few years, resulted in an intolerable situation in some other corps or grade. Naval officers must be held partly responsible for this unsatisfactory legislation. They have differed so widely in their opinions as to what is necessary and what is best, that Congress has had great difficulty in ascertaining the true state of affairs. But practically all officers

Digitized by Google

have realized the necessity for a general staff and have advocated legislation for the creating of such a body. Consequently in so far as the lack of such a staff has effected our unsatisfactory personnel condition, it seems equitable that Congress should be held to blame. There is no doubt that had Congress authorized a general staff on which all corps are properly represented, such a staff would have welded together the various and diversified opinions as to what is desirable, with the result that a bill having the confidence of the Navy, the Navy Department, and the Congress would have been presented and enacted into law. We would not then have had the extremely unsatisfactory personnel conditions that now exist. There appear to be no immediate indications of the authorization for a general staff, in view of which there is not much prospect of satisfactory personnel legislation. However, if we could produce a champion among our officers high in rank, who is willing to take up the cudgel and fight for the desirable and necessary reforms, there would be an excellent chance of his obtaining satisfactory results. The Navy has, on several occasions, produced officers who through their ability, zeal, magnetism, and force of character, have, by their sheer persistency, succeeded in getting for the service many reforms that were otherwise unobtainable. The efforts of these officers have been along material or administrative lines. They have neglected the personnel. A personnel champion is what is needed at present.

The statistical portions of what follows relate to the entire enlisted force, and, in the main, only to the line officers of the commissioned personnel. The various staff corps are neglected—not because of a lack of appreciation that these corps are most important and an absolute necessity for suitable naval organization, but because that which is true concerning conditions in the line is equally true of conditions in the staff corps, and too much statistical data becomes boring. For these reasons, therefore, the line, as a rule, is used for illustrating our weakness.

THE FACTS CONCERNING OUR ACTIVE FORCES.

On November 1, 1915, the active list contained 1,920 commissioned line officers. These were distributed in the various grades as shown in the following table:

TABLE I.—*Distribution of commissioned line officers.*

Grade.	Number in grade.	Percentage of whole number.
Rear admiral	24	1.3
Captain	90	4.7
Commander	122	6.4
Lieutenant commander	204	10.6
Lieutenant	351	18.3
Lieutenant (j. g.)	761	39.6
Ensign	368	19.1
Total	1,920	100.0

There are included in the above, as extra numbers, 6 rear admirals, 20 captains, and 10 commanders. This makes the percentage of the whole number higher in these grades than they would be under normal conditions.

The active list of commissioned warrant officers and warrant officers of the line comprises approximately 670, distributed as follows:

Chief boatswains and boatswains	200
Chief gunners and gunners	200
Chief machinists and machinists	270

The law authorizes an enlisted force of 48,000 men and 3,500 apprentices, making a total of 51,500. This number is exclusive of men performing duty on ships assigned to the Naval Militia, and of those prisoners in confinement who are sentenced to dishonorable discharge. Included in the number are approximately 1,500 men of the hospital corps. These men can not be considered as a part of the fighting force. At present the Navy is recruited to its full authorized strength, so the total number of enlisted men, including those on naval militia ships, and the prisoners, is about 53,000.

Digitized by Google

In order to illustrate the extent to which this personnel is distributed the following table is inserted showing the status of all serviceable vessels:

TABLE II.—*The status of ships.*

Class of ship.	In full commission.	In reserve, 0.3 of crew.	In ordinary, 0.1 of crew.	Not in commission.	Under construction.	Authorized.	Total.
Battleships:							
First line	7	1			6	3	17
Second line	13	8	1	3			25
Armored cruisers	6	3	1				10
Cruisers:							
First-class	2	3					5
Second-class	1	1		2			4
Third-class	10	4	1	1			16
Destroyers	38	17		2	11	6	74
Monitors	5	2		2			9
Submarines	38				19	19	76
Transports	2			3	1		6
Gunboats	21	1		7			29
Supply ships	4				1		5
Fuel ships	22			1	1	1	25
Converted yachts	5			11			16
Tugs	48						48
Tenders	7				2		9
Special types	7	2		1			10
Torpedo boats	1		13	5			19
Total	237	42	16	38	41	29	403

In addition to the large number of ships, there is our extensive shore establishments that must be provided with personnel. This comprises the Navy Department with its bureaus, offices, and important boards; the War College, Naval Academy, and four training stations; the numerous trade schools; 18 navy yards and stations, with their various adjuncts; an aeronautical station; and many smaller stations, such as hospitals, magazines, recruiting stations, and radio stations. The shore establishment is so large its requirements demand 25 per cent of the total commissioned line officers, 35 per cent of the commissioned chief and warrant officers, and 20 per cent of the enlisted force.

Below is shown the number in each grade and the percentage in each grade of the officers performing duty on shore:

TABLE III.—*Officers performing shore duty.*

Grade.	Total number in grade.	Number performing duty on shore.	Percentage performing duty on shore.
Rear admiral	24	16	67
Captain	90	59	65
Commander	122	63	50
Lieutenant commander	204	103	50
Lieutenant	351	99	30
Lieutenant (j. g.)	761	147	20
Ensign	368	20	5
Chief boatswain and boatswain	200	80	40
Chief gunner and gunner	200	83	40
Chief machinist and machinist	270	80	30
Total	2,590	747	29

Although such a large percentage of the officers and enlisted men are performing duty on shore, their numbers are reduced to the lowest practicable limits. The shore establishment is for the proper maintenance of the fleet. The fleet would be better maintained if the personnel on shore were increased. Those of us who go to sea know that the ships do not get as good service at the navy yards as they should; and those

Digitized by Google

of us who are responsible at the yards, or who are performing duty at the yards, know that the ships are not getting the efficient service that would be forthcoming if adequate personnel were available. To further reduce the shore complements in order to augment the depleted fleet complements would result in a reduction in efficiency throughout the service.

The inadequacy of the personnel on shore is very unfortunate. The inadequacy of the personnel afloat is most deplorable. From Table II we ascertain that there are 42 vessels in reserve having only three-tenths of their full commissioned complements, and 16 vessels in ordinary having only one-tenth of their full complements. There are 38 vessels out of commission with no personnel on board (except a few ship keepers). In addition, there are 41 vessels under construction and 29 vessels authorized, but not commenced, for which there is no personnel, and for which no provisions have been made to obtain the necessary officers and crews.

One would suppose that the vessels in full commission had their full authorized crews on board. Unfortunately such a supposition is a grievous mistake. The full commissioned complements, as now authorized, are "peace" complements, and not "war" complements. These peace complements are from 15 to 30 per cent less (both officers and men) than are necessary properly to fight the ships. But what is still worse, is the fact that these full commissioned ships have not even their allowed peace complements on board. All of them are short a number of officers, and the battleships have an average vacancy list of over 100 men per ship. It was recently necessary to reduce the complements of destroyers by 20 per cent in order to provide crews for other vessels. There are no reserves—either officers or men—available for emergency calls. If a new ship is to be commissioned, one or more already in service must be placed out of commission, or the personnel for the new ship provided by a general reduction all along the already depleted line. This general reduction process has been in operation for some time. The Navy lives from hand to mouth so far as the personnel is concerned, and the living is most frugal. But there is no relief in sight, and with the new construction nearing completion, the conditions must continue to grow worse until such time that any provision Congress may make for additional personnel may become effective.

The foregoing statements of the facts leave no doubt as to the inadequacy of the personnel. We can survive, with discomfort, this state of affairs in times of peace. Could we successfully overcome the handicap in case of war? Not unless our enemy were as badly off as we are, and there are no prospective enemies in sight who have been shortsighted enough to permit themselves to decline to such an extent.

Not only is the number of line officers inadequate, but the various grades are not properly balanced. Captains are performing the duties of rear admirals, lieutenant commanders those of commanders, lieutenants those of lieutenant commanders, and lieutenants (junior grade) those of lieutenants. They perform the duties and have the responsibilities of the higher grades, but they receive neither the rank nor the corresponding pay. The seriousness of this situation is added to by the gact that promotion is practically at a standstill, except in the case of ensigns to junior lieutenants, which latter grade is being increased at the rate of about 125 a year. This state of affairs has caused a current of unrest and a feeling of discontent among the commissioned personnel that is detrimental to the efficiency of the service. With some officers this undercurrent is made manifest by a spirit of indifference; with others there is a tendency to worry. All officers feel that the time has arrived when something must be done to relieve the present unsatisfactory condition. They know that legislation is contemplated for the purpose of providing a remedy, and they are confident that such legislation as has recently been recommended will not produce the improvements so necessary to place the commissioned personnel on a proper basis. The Navy's esprit de corps is to-day at a lower ebb than at any time during the past 20 years.

What changing policies have been evident from time to time have been based on material conditions, and not on the personnel situation. A few years ago the vessels were assigned to home yards in accordance with the characteristics of each ship, and the necessity of the various yards. These assignments were supposed to be permanent, and, accordingly, the Bureau of Navigation took steps toward assigning and transferring the personnel so that both officers and men could serve on ships that went to the navy yard nearest their homes. The lack of permanency in the assignments of vessels to home yard is made manifest by a comparison of the details made a few years ago with the assignments to-day. Numerous cases have occurred where vessels' home yards have been changed owing to certain material conditions in the vessels themselves, the needs of a navy yard for more or less work, or even for political reasons.

Digitized by Google

The effect on the personnel appears not to have been considered, and if considered, dismissed without serious thought. Only recently have the home yards of vessels been changed from Portsmouth, N. H., to New Orleans, La. The effect on the personnel was clearly defined by the commanding officer of one of those vessels, but, as usual, personnel considerations were subjected to the material viewpoint. This policy of subjugating the personnel to the material survives in spite of the fact that, "Historically, good men with poor ships are better than poor men with good ships." We appear to ignore a fundamental principle when we make the personnel subordinate to the material. The mere possession of good material can not produce an efficient personnel, but an efficient personnel will, by reason of its very efficiency, bring the material to a high standard.

Despite the lack of collective efficiency as represented by the whole Navy, and which is due to inadequacy in numerical strength and weakness in organization and administration, it must be conceded that the individual efficiency and capabilities of officers and men has steadily improved. The reason for this is the higher moral and duty standards required. The selecting-out board produced a healthy impulse to individual effort, and increased the average efficiency through the elimination of many below the average. The establishment of post-graduate schools for officers, and the facilities offered for special instruction along various lines, have had a marked effect in boosting individual efficiency. The general trend of the times in demanding a higher state of individual efficiency in all walks of life, has left its impression on the naval personnel. As for the enlisted men, one has only to look back to the days prior to the Spanish-American War in order to appreciate the great advancement that has been made. Higher qualifications for enlistment, more stringent rules for advancement, improved methods of discipline, a firm stand against liberty breaking and drunkenness, and the establishment of training stations and trade schools, have all had a salutary effect.

And yet, with this marked advance in individual efficiency, the collective efficiency has failed to keep pace through no fault of the personnel actually assigned to ships and stations, but because the inadequacy of this personnel has been too much of a handicap, and because the personnel in general has received repeated setbacks for the benefit of the material. The inadequacy of the personnel has not only produced the singular result of having all our ships underofficered and undermanned, but has caused so many and such frequent changes in the personnel, that the necessary team work required to make an efficient fighting machine can not be developed. Our target-practice rules prevent the employment of artificial means so far as material is concerned, but there is not a ship in the Navy that is not forced to use artificial means in the employment of its personnel during target practice. It is regretted that the confidential nature of "Report of Battle Practices, Spring, 1915" prevents the quoting in full of the remarks made by the commander in chief of the Atlantic Fleet concerning the shortage of personnel in his fleet during the last battle practice. It is unfortunate that no matter what legislation the next Congress enacts, the present state of affairs must continue for some time, as officers and men can not be made over night, owing to the length of time required to educate the officers, and to recruit and train the enlisted men.

PERSONNEL REQUIREMENTS IN CASE OF WAR.

Should the country be involved in war it would be necessary, in order properly to man our ships and shore stations, to have an immediate increase of 2,520 line officers, 647 commissioned warrant and warrant officers, and 53,900 enlisted men. The respective percentages of increase over what we now have are 130 for the line officers, 100 for the commissioned warrant and warrant officers, and 102 for the enlisted men. These figures are so astonishing it is not sufficient to pass them by with the mere statement of fact, but, in order to make the truth impressive, it is considered necessary to give in detail and in tabulated form the requirements of the various units which compose the Navy as a whole. First, the requirements for services afloat will be shown:

	Totals	31	80	138	372	996	946	1,000	3,563	326	233	399	958	91,300

In this table are included all vessels on the Navy list excepting those specially designated by the department as unsuitable for war purposes; all vessels under construction that should be completed by January 1, 1917; all the fuel ships that are now manned by merchant crews, and 75 vessels, which is the minimum number that probably would be purchased. The number of officers and men required adequately and efficiently to man these vessels are not a matter of hearsay or guesswork. They are the numbers which experience has shown to be necessary.

It is assumed that all vessels excepting those designated as unfit for war purposes would be manned in case of war, provided the personnel could be obtained. This assumption is based on what actually happened in the Spanish-American War; and it can not be supposed for an instant that the Government is spending large sums of money for the maintenance of men-of-war that would not be used in case of war. Such an expenditure of the public funds would be an extravagant waste.

Of the 23 fuel ships, all but 4 are manned by merchant crews. Two of the four manned by Navy crews are engaged in surveying duty, and the other two have experimental machinery which the department evidently considers can not be satisfactorily operated by merchant crews. There can be only two good reasons for operating these auxiliaries with merchant crews. One reason is because there is not sufficient naval personnel to detail for this duty; the other is because it is cheaper. The auxiliary service as now conducted operates more or less satisfactorily in peace times, but it can not give efficient service in time of war unless the merchant crews are replaced by Regular Navy crews. This is due to the unfortunate fact that the crews of these vessels are composed of practically all nationalities except Americans. In case of war many of the crews would have to be discharged, many would desert, and the rest could not be trusted. There are no American merchant sailors to take their places. Therefore we should have to provide naval personnel for them.

The beginning of the Spanisn-American War found the Navy Department making strenuous efforts to purchase vessels of all descriptions, and as a result of these efforts a large number were obtained and manned with Navy crews. Should we again have a war it would be necessary to purchase vessels and convert them into mine layers, mine sweepers, patrol boats, supply ships, fuel ships, and transports. In the absence of a large merchant personnel, and a lack of organization among our

Digitized by Google

fishermen, towboat men, and yacht crews, there will be much difficulty in finding crews for the purchased vessels. But we may rest assured that they will be purchased, nevertheless.

As our organization on shore has always been inadequate for the proper administration and maintenance of the fleets, and as the local organizations of the various navy yards and stations have been undergoing frequent and disorganizing upheavals, an estimate of the actual requirements for the entire shore establishment, in case of war, can not be so accurately made as for the vessels of the fleet. That a large number of officers and men would have to continue on duty ashore after the beginning of hostilities there is no doubt. An estimate of the requirements is made in the following table:

TABLE V.—*Requirements for immediate service on shore in case of war.*

Station.	Flag officers.	Captains.	Commanders.	Lieutenant commanders.	Lieutenants.	Lieutenants (junior grade).	Total line officers.	Chief boatswains and boatswains.	Chief gunners and gunners.	Chief machinists and machinists.	Total warrant officers.	Enlisted men.

Total	35	85	120	165	215	45	665	92	102	102	296	10,500

A 30 per cent increase over the number of officers now performing shore duty must be considered a very modest estimate when contemplating the probability that the amount of business to be accomplished will at least be doubled and that a higher degree of efficiency will be demanded from the shore establishment than is evidenced at present.

There is an impression in some quarters that, in case of war, it will be a simple matter immediately to send to sea all officers performing shore duty. Not only is it the impression that this could be done, but many believe that it would be done. Those who entertain this conviction fail to comprehend that the fleets can not exist without the assistance of the shore establishment, and that this is the reason for the existence of and for the maintenance of the shore stations with their numerous adjuncts. The fleet must depend on the navy yards and stations for stores, provisions, repairs, and docking. The fleet must depend on the War College, Naval Academy, and training stations for the necessary trained personnel. The fleet must depend on the Navy Department for information and instructions, and for the administration of all affairs not directly concerned with the internal management of the various units. In fact the efficiency of the fleet depends in a great measure on the efficiency of the shore establishment. Surely, in view of this, it can not be expected that the Navy Department, when war is imminent, will cripple the fleet by depleting the shore stations of the personnel necessary for their proper conduct. This brings us to the important question as to what personnel is necessary for the proper conduct of the shore establishment. The answer must be—the sea-going personnel. Only men who go to sea can appreciate the necessity of having the shore establishment controlled and operated by men who thoroughly understand the personnel and material requirements of vessels employed on active duty. And only men who have been to sea can thoroughly understand these complex requirements. It is essential, therefore, that line officers continue on duty at the Navy Department, the navy yards, and other shore stations after the beginning of hostilities, and any reduction in the number of line officers performing such duties will result in a corresponding reduction in the efficiency of the fleet. Navy yards are military establishments and must be operated in accordance with military principles and methods. In order to do this successfully, a line

Digitized by Google

officer high in rank must be the controlling factor. An officer of any other corps can not possibly have the necessary experience or education along the proper lines to enable him to cope with the difficulties that would confront him in time of war. Any attempt to place the navy yards under civilian control would undoubtedly have a calamitous result.

The Naval Academy and the training stations must continue in operation unless, as the war progresses, we are to fill vacancies in the numerous vessels with personnel that is entirely untrained. There should be not less than 5,000 apprentices under training at all times, and the training period should be reduced to two months. Even this would give us only about 80 men a day to send to the fleet. To conduct the training stations would require 1,000 men as a minimum. The navy yards and stations where recruits and ex-enlisted men are being enlisted and assembled will require at all times no less than 3,000 men. The large number will be due to the fact that men can not be distributed without first collecting them. The process is continuous.

In addition to the officers and men required for duty afloat and duty on shore, it is absolutely essential that there be a 5 per cent excess to allow for casualties, sickness, leave, and those traveling to and from their stations. If this percentage is not provided, it will mean that our ships and stations will never have their full complements, and it is of the utmost importance that this condition be not allowed to confront us in war times.

Having determined the numbers of officers and enlisted men required for service afloat, the numbers required for duty ashore, and the 5 per cent additional necessary to allow for casualties, etc., it is a simple matter by combining these to ascertain the total personnel required at the beginning of hostilities. If from this total we subtract the active forces now possessed, the result will be the necessary additions that must be provided by our reserves and such recruits as can be mustered into service. These figures, tabulated below, are most impressive:

TABLE VI.—*Total requirements for immediate service in case of war.*

	Flag officers.	Captains.	Commanders.	Lieutenant commanders.	Lieutenants.	Lieutenants (j. g.).	Ensigns.	Total line officers.	Chief boatswains and boatswains.	Chief gunners and gunners.	Chief machinists and machinists.	Total warrant officers.	Enlisted men.

THE SOURCES OF SUPPLY.

There are two main sources of supply for providing the personnel required, as shown in the foregoing table. The first of these sources consists of the retired list, the Naval Militia, the Naval Reserve, and the Naval Academy. The second source consists of the unorganized ex-officers and ex-enlisted men, and the untrained masses.

The line officers on the retired list have been retired because of old age, length of service, physical disability, undesirability, or personal request. There is no doubt but that all of these officers, if assigned to active duty in time of war, would give to the country the very best that is in them. While a number of them are well qualified

Digitized by Google

or duty ashore, only a comparatively few could be expected to perform efficient duty afloat. Many of these officers would undoubtedly be assigned to duty by the Navy Department, and arrangements have been made for the necessary details in cases where the officers' ages or physical condition permit of active service. However, in view of the fact that most of these officers were retired because considered unsuitable for active duty in times of peace, we should not count on many lasting for any great length of time under the strain that war conditions impose.

Below is shown the number of retired officers of the line and the number in each grade to be assigned to active duty in case of war:

TABLE VII.—*Retired officers of the line.*

Grade.	Number on retired list.	Number to be assigned to active duty.	Percentage.
Rear admirals	144	23	16
Commodores	45	22	50
Captains	63	31	50
Commanders	105	80	76
Lieutenant commanders	40	26	65
Lieutenants	44	35	80
Lieutenants (junior grade)	18	15	83
Ensigns	30	28	93
Chief engineers	23	2	9
Past assistant engineers	20	7	35
Assistant engineers	13	10	77
Chief boatswains	42	28	67
Boatswains	17	15	88
Chief gunners	20	15	75
Gunners	17	14	82
Chief machinists	19	16	84
Machinists	41	37	80
Total	701	404	58

As the commodores to be assigned to active duty were advanced to their present grade on retirement, and never performed the duties of flag officers, they must be considered as captains. The engineer officers are of such age and have been retired for so long that there are only a few duties to which they can be assigned.

There are fewer than 600 men who have been retired on the completion of 30 years' service in the enlisted force. In view of their ages, not more than 100 could be profitably assigned to active duties.

The Coast Guard, which in time of war would probably be placed under the Secretary of the Navy, has the foundation for an excellent reserve provided the Navy Department will arrange with the Treasury Department for the training of the personnel along the lines that would make them the most useful in case of war. But even if this were done, the Coast Guard can not be considered as an organized reserve so far as the manning of the Navy material is concerned, because the entire personnel would be required to man its own vessels and stations. Therefore no assistance in manning our ships in time of war can be obtained from the Coast Guard.

There is authority for the formation of a reserve of 25,000 ex-enlisted men who have received honorable discharge from the Navy. The actual strength of this organization is at present less than 150 men, so its value as a resetve must be considered as negligible.

While the Naval Militia is the only organized reserve, unfortunately it can not be considered an efficient trained reserve. The units composing this organization are a conglomerate assembly, each having its own standard of efficiency. Until the passage of the Naval Militia act by the last Congress, there were no apparent attempts on the part of the Central Government to make the various units into a well rounded body. In some States the organizations resembled social clubs. In only a few of the States were there any semblances of real efficiency. That the organization as a whole is not so efficient as it should be is not the fault of the individuals who, through their sense of patriotism, join this service. These men deserve much credit for giving their time to such drills and such service as are practicable. The fault has been partly with the State governments in not making suitable laws and appropriating sufficient funds, and partly with the Central Government in not insisting on suitable laws and in not withholding financial aid until assured that the money provided would bring an adequate return.

Digitized by Google

The new Naval Militia act, if conscientiously enforced, will be conducive to a great advance in efficiency throughout the entire organization. It provides for the organization of the militia in units of convenient size, in each of which the number and rank of officers and the distribution of the total enlisted strength among the several ratings of petty officers and other enlisted men shall be established by the Secretary of the Navy, who shall also establish the number of officers, petty officers, and other enlisted men required for the organization of such units into larger bodies for administrative and other purposes. Provision is made for the examination of officers and men, and for the appointment of instructors from the regular naval service. The President is given authority to call the Naval Militia into the service of the United States when he deems it necessary; and when so called the militia shall be governed by the Navy regulations and the articles of the government of the Navy. Naval Militia officers mustered as such into the regular service shall rank with but after officers of the Regular Navy in the same grade and rank; except that for the purpose of determining who shall exercise command over a combined force composed of vessels commanded by Naval Militia officers and of vessels commanded by officers of the Navy in conjunction, all officers of the Naval Militia of or above the rank of lieutenant commander will be regarded as junior to lieutenant commanders of the Navy. The Naval Militia when called into the service of the United States shall, during the time of service, be entitled to the same pay and allowance as provided for the Regular Navy, but no officer or enlisted man shall be held to service beyond the term of his existing commission or enlistment.

Although there are some defects in the provisions of the Naval Militia act, there is a great opportunity, by taking advantage of its many good points, to make a really efficient reserve for the naval service. The Navy Department has enthusiastically taken up the matters allotted to the general government, and it is to be hoped that the several States will respond with an equally enthusiastic endeavor to do their part. The general order issued by the Navy Department sets forth in detail the unit of organization, rank of officers, ratings of enlisted men, qualifications of officers and men, and scope of the examinations required. This order states that the various Naval Militia organizations in order to be eligible to participate in Federal funds; to be supplied with arms, uniforms, equipment, etc.; and in order that they will be eligible to be mustered into the service of the United States without further professional examination, must comply with the provisions of this general order before February 16, 1917.

The organizations from the several States would be much better prepared for efficient service at the beginning of hostilities if the Navy Department would require their training to be along certain specific lines, instead of along general lines as is now the case. The militia units get practically all their training on small vessels which are considered of little value for war purposes. A few days each year a so-called cruise is made on a comparatively modern vessel. But with the limited amount of training practicable it can not be expected that the militiamen can become efficient all-round men-of-warsmen.

The idea then of making them all-around men-of-warsmen should be abandoned, and instead they should be trained for duty on the auxiliaries such as supply ships, fuel ships, mine layers, mine sweepers, and patrol vessels. We would then have, at the beginning of hostilities, a force which could relieve the large number of trained regulars now assigned to auxiliaries. This would enable the department to transfer them to the fighting ships where their services will be urgently required.

In the regular service no man may first enlist if he is over 30 years of age. In the naval militia, men may first enlist up to the age of 45 years, and they may continue to serve until they reach the age of 62. We who go to sea know that under modern conditions the enlisted man over 45 years of age who is capable of performing efficient service afloat is the exception. There are no places for old men on modern men-of-war, and this will be more apparent in war times than in peace. Since the sole object of the Naval Militia is to supply a reserve for the active service in time of war, every endeavor should be made to have the militia composed only of officers and men who are capable of performing active duty. This will not be the case if the militia's ranks are partly filled by men between the ages of 45 and 62. As our reserve forces are so limited we must avoid the tendency to make the organizations effective on paper only, instead of in reality. That there is such tendency is shown not only in certain provisions of the general order setting forth the Naval Militia requirements, but also in the law providing for the reserve composed of ex-honorably discharged men. The latter reserve takes the form of a graded retired list for the enlisted men, instead of an actually effective fighting force to be called on when the emergency demands.

Digitized by Google

As men of the Naval Militia when mustered into the service of the United States can not be held beyond the term of their enlistments, steps must be taken toward making the term of enlistment of sufficient length to eliminate the probability of a large percentage of the militia being short-time men at the crucial moment when their services may be required.

Twenty-one States and the District of Columbia are represented by Naval Militia organizations. Each State makes its own laws in regard to the numerical strength of its organization. But whatever this strength may be, the units must be in accordance with the Navy Department's requirements. On July 1, 1915, the total Naval Militia strength authorized by the State laws was 12,574. On this date there were actually enrolled 606 officers and 7,706 enlisted men—only 65 per cent of the allowed quota. Of the 606 officers, 483 are of the line and are distributed as follows:

TABLE VIII.—*Line officers of the Naval Militia.*

Grade.	For line duties only.	For engineering duties only.	Total.
Commodores	1		1
Captains	5		5
Commanders	20		20
Lieutenant commanders	35	6	41
Lieutenants	119	26	145
Lieutenants (junior grade)	93	14	107
Ensigns	122	27	149
Warrant officers	7	8	15
Totals	402	81	483

As the commodores, captains, and commanders become subject to the orders of lieutenant commanders of the regular service when operating together, they must be considered as lieutenant commanders in making assignments to active duty.

To provide the requisite number of junior officers it will be necessary to send the two or three senior classes of midshipmen to sea. If two classes are sent, about 400 officers will be obtained; if three classes are sent there will be an additional 250 officers. There will be some reluctance about sending these young men to the front, and it is certainly is a reflection on our methods that our personnel has become so depleted as to make it necessary in time of war to reduce the amount of instruction considered essential to prepare the midshipmen for service afloat in times of peace. But there is no question that the midshipmen, with from one to four years military training at the Naval Academy, will make much better junior officers than can be obtained from any other source; and the great demand for junior officers will force the Navy Department to detail them to active duty with the fleet. During the Spanish-American war a large number of naval cadets were sent home on leave until the war ended, and at the same time, a number of acting naval cadets were appointed from civil life. It is to be hoped that political influence will not again be able to force such a fiasco on the service.

There are a few ex-officers and many ex-enlisted men who would immediately answer the call to the colors in case of hostilities. Some of the officers are now serving with Naval Militia organizations, and, therefore, have been included in Table VIII, leaving only a small number to be included among the unorganized reserves. The thousands of enlisted men who would enlist, constitute a valuable potential reserve that is of the utmost importance to the country. The Navy Department desired to organize these men and succeeded in obtaining legislation, authorizing such an organization, which must not exceed 25,000 men. The plan has proved a failure as the men will not enlist in the reserve owing to certain conditions imposed. For example, the law authorizes the Navy Department to require a large amount of annual service of all men in the reserve; and although the department has waived the requirement, the men will not enlist as long as the power to call them into service during peace times remains. The small amount of compensation does not warrant the taking of unnecessary chances on their part. They undoubtedly feel that they are discriminated against when it is considered that, as trained personnel, they would be liable for one or two months' active service each year, while the untrained men of the Naval Militia are required to perform only a few days of active duty with the regular service. But even if these men do not enlist in the reserve, they are a valuable asset, as it is probable that there are about 15,000 of them whose ages and physical condition are such that they could be counted on to enlist in the regular service in

Digitized by Google

time of need. Besides these 15,000 honorably discharged men there are about 3,000 men whose connection with the Navy has been severed by other than honorable means, and who could be counted on to enlist if the department will permit, and if, in the cases of deserters, the President will grant them amnesty. Our need for trained men will be so great it will be necessary to take these men back into the service, just as was done during the Spanish-American war. It is another case where our shortsighted policy in not providing sufficient personnel will require us in war times to depend on men whom we do not consider suitable in peace times. The numbers of trained personnel available as a reserve in case of war have been enumerated. If the various units are added together and the total thus obtained is subtracted from the numbers actually required at the beginning of hostilities, the remainder will be the number of recruits that must be obtained from the untrained masses. This summary is made in the following table:

TABLE IX.—*Summary of organized and unorganized reserves.*

Source.	Flag officers.	Captains.	Commanders.	Lieutenant commanders.	Lieutenants	Lieutenants (junior grade).	Ensigns.	Total line officers.	Chief boatswains and boatswains.	Chief gunners and gunners.	Chief machinists and machinists.	Total chief warrant and warrant officers.	Enlisted men.
Retired list, Table VII	23	53	80	28	42	25	28	279	43	29	53	125	100
Naval Militia, Table VIII	.....	.....	.....	67	145	107	149	468	4	3	8	15	7,706
Naval Reserve	.....	.....	.....	.....	.....	.....	.....	.....	.....	.....	.....	.....	150

Exofficers and exenlisted men	.....	.....	.....	5	10	10	10	35	.....	.....	.....	.....	18,000
Total available reserve	23	53	80	100	197	142	837	1,432	47	32	61	140	25,956
Total required reserve Table VI	45	83	149	360	921	380	687	2,520	239	152	256	647	54,900
Additional required from untrained sources	22	30	69	260	724	88		1,088	192	120	195	507	28,944

A study of this table reveals a really startling state of affairs. It can not be possible that the naval authorities, the Congress, and the people realize that with all our available personnel—both active and reserve—there would still be required at the very beginning of hostilities, in order to man such material as we possess, an additional 1,100 commissioned line officers, 500 warrant officers, and 29,000 enlisted men. Can it be realized that this additional personnel must be recruited and partially trained before they become available for active service, and in order to recruit and train them from one to two years will be required? And can it be realized that during these two years there will be many ships added to the Navy, and there will be many casualties, so that large numbers of additional officers and men must be continually provided? The true situation can not be appreciated or we would not continue to hear the loud cries for more ships, more ships, and only a faint peep for additional personnel. We do need more ships, but we need the personnel much more urgently, and if disaster is to be averted, our first duty should be to obtain sufficient personnel to man at least such material as we could use at the beginning of a war. It will be hard enough to obtain the additional officers and men required for new ships and to replace casualties, after the war has started, without leaving until that time the providing of our immediate necessities.

The only way to obtain the higher officers required would be to promote the officers from the lower grades. It is doubtful, though, if the promotions would actually be made. The lower officers would be required to perform the duties of the higher grades without receiving the corresponding rank and pay. This, of course, is an injustice that is appreciated only by the officers concerned, and consequently there is not much likelihood of a remedy, especially as the usual status of the Navy list has required such

Digitized by Google

assignments for some years past. Whether or not the promotions are actually made, it would be necessary under present conditions to assign officers to perform the duties of higher grades, as follows: Twenty-two captains perform flag officers' duties, 52 commanders perform captains' duties, 121 lieutenant commanders perform commanders' duties, and 381 lieutenants perform lieutenant commanders' duties.

As there are only 351 lieutenants on the active list, it is evident that every one of them would be called on to perform lieutenant commanders' duties, provided the department desires the duties of that grade to be efficiently performed. The important watch duties would of necessity have to be done by those who are now junior lieutenants and ensigns, and the 1,100 places for junior officers would have to remain vacant until some means of filling them could be found.

The 500 warrant officers could be furnished by promoting chief petty officers. There are a number of such petty officers who have passed the required examinations, but have not been advanced owing to the policy of the Navy Department to keep the number of warrant officers down to the lowest possible limit the Navy can struggle along with.

So the really big problem that would confront us immediately on the outbreak of hostilities is how to obtain 1,100 junior line officers, and 29,000 enlisted men. It must be confessed that we can not possibly obtain them. Therefore it is absolutely necessary that immediate steps be taken towards placing our naval personnel on such a basis that in the case of war overtaking us in the future, we will not be in the critical predicament that we now find ourselves.

While the figures concerning officers relate to the line only, the fact must not be overlooked that the various staff corps are just as deficient in numbers as is the line; and what has been stated in regard to these deficiencies of the line is equally true for the staff.

There should be, in peace times, sufficient personnel, active and reserve, to man immediately all our ships and stations on the outbreak of hostilities. What percentage of this force should be active, and what portion should be reserve, depends on the policy of the Navy Department with reference to the status of the vessels of the fleet in peace times, and on the number of reserves that can be organized so as to be immediately available on the outbreak of hostilities. It is manifest that the number of vessels kept in full commission should be as large as possible if the fleet is to be efficient at the beginning of a war. Therefore it is essential that our active naval forces should, at all times, be as large as the financial problem involved admits.

Our present status with reference to the proportions between active forces and reserve forces, and in comparison with the total forces required is shown below:

TABLE X.—*Proportion between present active, reserve, and required forces.*

	Commissioned officers.		Warrant officers.		Enlisted men.	
	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.
Present total active force, Table III	1,920	43	670	51	53,000	49.5
Total required force, Table IX	1,432	32	140	11	25,956	24
Additional required force, Table IX	1,088	25	507	38	27,944	26.5
Total force necessary, Table VI	4,440	100	1,317	100	106,900	100

From this table we learn that our active and reserve forces together are only 75 per cent of what they should be in the case of commissioned officers, 66 per cent in the case of warrant officers, and 73.5 per cent in the case of enlisted men. It is imperative that immediate steps be taken to make up these deficiencies. The important question is what proportion should be allotted to active forces and what proportion to reserve. In view of the fact that a large percentage of our reserves are not organized and are not in any way under obligation to serve in the Navy, and in view of the unsatisfactory results obtained from all efforts to form a satisfactory naval reserve, we must conclude that the greater part of the additional forces necessary immediately on the outbreak of war should be obtained by adding to our active forces, and such additions should be made as soon as possible. In other words our active naval forces should be 75 per cent of the total forces needed, and the ratio between actives and reserves should be as three to one.

Digitized by Google

An exact comparson between the personnel of our Navy and of the other leading naval powers is impracticable owing to the unreliability of the information at hand. But we do know that while the active personnel of the navies of Great Britain, Germany, France, Japan, Italy, and Austria approximate the same per 1,000 tons of ships as in our Navy, the effective trained reserves in each of these countries is so much greater than ours as to make comparisons startling. In the powers mentioned the reserve forces average 85 per cent as large as the active forces, while in this country the organized reserve is only 12 per cent as large as the active forces, and if we include the unorganized reserves whom we guess will offer their services in case of war, the total reserve is only 50 per cent as large as the active force. We also know that the reserves of these foreign countries are organized from men who have actually served in the Navy, or from men who are in the merchant marine. The differences in the forms of government and the differences in the characteristics of the people enable these foreign governments to organize well-trained reserves which appears to be impracticable in the United States. These foreign countries also have merchant marines which are subsidized by the governments, thereby giving a claim on the personnel in the event of war, which is not the case in this country. In addition, the personnel of the merchant marine in these foreign countries are natives or citizens of their respective countries which is a distinction that the United States can not claim.

A further comparison between our personnel and that of foreign countries shows that while our total actives and reserves give us 83 officers and men per 1,000 tons of ships built and building, the average in the six navies previously mentioned was, just prior to the beginning of the present war, 123 officers and men per 1,000 tons of ships built and building. It is therefore evident that not only is our personnel deplorably inadequate when we view it without reference to the foreign navies, but it is alarmingly so when we consider the great extent to which the foreign countries surpass us in this most important element of national defense and preparedness. The comparisons emphasize the necessity for immediately improving our personnel conditions.

There is a movement on foot to organize a naval reserve in this country, to be composed of the personnel on yachts, motor boats, and fishing vessels. That such organizations are desirable and necessary in order to place the country on a proper defensive basis, must be conceded by all who have followed the European war. But we must not allow ourselves to be deceived into believing that such reserves will in anyway relieve the personnel shortage as shown to exist on our men-of-war and at the naval stations. If such reserves are organized they will be required to man the yachts, motor boats, and fishing vessels, and will not be available for any of the vessels shown in Table IV.

It has been shown in Table VI that, in case of war, we would require 4,440 commissioned line officers, 1,317 warrant officers, and 106,900 enlisted men. As, owing to our inability to organize a large reserve, the active forces should be 75 per cent of the total requirements; to be properly prepared for an emergency we should now have in the active naval forces 3,330 commissioned line officers instead of only 1,920; 990 warrant officers, instead of 670; and 80,000 enlisted men, instead of 53,000. Having determined the needs it becomes necessary to devise a means of supplying the shortage:

THE REMEDY.

Our status has fallen so very far below what it should be that, it is, of course, impossible to effect a remedy in a short time. Unless we throw discretion to the winds and clamor for legislation that will be impracticable, or that will not be satisfactory, it will be necessary for a period of from 5 to 10 years to elapse before the naval personnel can be increased sufficiently and brought to that standard of efficiency which is necessary to carry us through an extended campaign. To do this in the shortest practicable time, our first move must be to obtain more officers and men. The providing of the men is a comparatively simple matter. We have not more of them now for the simple reason that the law does not allow them. We are recruited to the full authorized strength, and have been so recruited for a year or more. There should be immediate provision made for an increase of 50,000 enlisted men, at the rate of 5,000 a year.

Fifty thousand men are required because in 10 years the added construction will make it necessary to have 20,000 men in addition to the 30,000 required at the present time. We could not get all these men at once, and in view of the inability of our organization to handle so large an increase it is not desirable that we endeavor to obtain them immediately. However, an increase of 5,000 a year will permit a healthy expansion of personnel that can be trained and distributed without any great upheaval. This number of additional men can be enlisted each year provided enough recruiting stations are established and sufficient funds made available for properly carrying on

Digitized by Google

the business. The question of distribution in the various ratings is now in the hands of the Navy Department. This is as it should be, and, in consequence, no legislation concerning the enlisted force is essential other than that which simply provides for an increase.

The two great defects in the officers' lists are lack of numbers and lack of proper flow of promotion. Now that the selection-out board has been abolished, and the Navy Department has adopted the policy of not accepting voluntary retirements, the lack of numbers will be partially remedied by the normal sized graduating classes from the Naval Academy. These classes, with the present number of appointments authorized by law, should average 175 graduates a year. The number of retirements, resignations, and deaths in the line of the Navy should average about 30 a year. Therefore under present laws and rules we can count on the total number of line officers increasing at the rate of 145 a year. In 10 years we would have 1,450 more line officers than at present, and the total would then be 3,370 line officers or 40 more than the number required for efficient service with our Navy at its present size. But it is certain that in 10 years from now there should be at least 4,000 line officers, and after that total is reached, the policy in regard to ridding the service of obsolete ships will be so well established that there will not be any great numerical increase in our vessels, but as new ships are completed, a corresponding number of old ones will be discarded. In other words, if a regular building program of proper balance is to be adopted, we can expect that in 10 years the Navy will have reached the numerical strength in ships beyond which Congress and the people will be unwilling to go, and from that date the new construction will be for the purpose of replacing the obsolete vessels. The Navy will then require 4,000 commissioned line officers on the active list to provide the 75 per cent of the total that would be necessary to properly man the ships and shore stations in case of war. As there are now only 1,920 commissioned line officers, it is evident that we must furnish 2,080 in the next 10 years—an average of 208 a year. The Naval Academy is the only source from which these officers can be properly supplied, and we have seen that under the present regimé the academy only furnishes sufficient graduates to give an average increase of 145 officers annually. Therefore it is necessary to increase the academy output so that the average graduates for the next 10 years will be 238, which is the 208 increase required, plus the 30 vacancies which will be created by retirements, resignations, and deaths. However, any increase authorized in the number of midshipmen will not be felt in the service until 4 years have elapsed, so no matter what is done in this respect, for the next 4 years our increase will average only 145 which gives a total of 580 during that period. The increase in the number of midshipmen must be such that in the 6 following years there must be supplied the difference between 2,080 (the number required in 10 years) and 580 (the number obtained in 4 years), a total of 1,500. This means an average increase during this 6-year period of 250, or 105 more than the present output. Although the number required will not be twice that being furnished, it will be necessary to double the number of appointments to the Naval Academy in order to permit of the desirable and necessary weeding-out process that is so essential in order to obtain graduates who can reasonably be expected to make good officers. We must conclude, then, that in order to obtain the necessary number of line officers as soon as practicable, there should be legislation authorizing the doubling of appointments to the Naval Academy for a period of 6 years.

One of the greatest faults in all personnel legislation affecting the officers has been the rule to fix definitely the number of officers allowed in each of the grades of lieutenant and above, instead of having the number in each grade determined by a definite percentage basis so that any increase in the total numbers would be felt in the proper proportions in each grade. The fallacy of such legislation as we are now laboring under can not better be illustrated than in the case of the lieutenants (junior grade). In 1905 there was not an officer of this grade in the Navy. To-day there are over 700 of them and the number is increasing more than 100 a year. Under the present laws and rules the officers at the bottom of this list must remain in their present grade for 30 years. This condition has been brought about mainly through the absence of a proper distribution of the officers in the various grades. Our second conclusion, therefore, must be to the effect that immediate legislation should be enacted which places and keeps the various grades in a definite ratio to each other. What should this ratio be? There is an apparent tendency towards making such a ratio depend on a tonnage basis; that there should be so many flag officers, captains, commanders, etc., for each 1,000 tons of ships. This basis may be satisfactory for a few years, but after that, unless the proportions between the ships of various classes do not change, there must be a readjustment. Changes are bound to take place and therefore readjustments will be necessary. These can easily be made, but as they

Digitized by Google

will be necessary, a better basis for apportioning the officers in the various grades would be in accordance with our actual requirements for each grade in case of war, rather than on a continually changing tonnage basis.

In Tables I and VI are shown the numbers of line officers now in each grade and the numbers there should be for immediate war service. By placing these numbers in parallel columns together with the percentages in each grade, it is a simple matter to determine what the numbers in each grade should be with our present total and what they should be based on a total of 4,000 commissioned line officers, which number has been determined on as being requisite for a peace basis 10 years from now.

TABLE XI.—*Proportion of commissioned line officers in grades.*

Grade.	1[1] Number now on active list (extra numbers in parentheses).	2 Percentage in each grade.	3 Number required for war purposes, Table VI.	4 Percentage in each grade.	5 Number should be in each grade at present, based on column 4.	6 Number that should be in each grade, based on total of 4,000.	7 Increase required in each grade within next 10 years.
Flag officers	24 (6)	1.3	69	1.6	34	65	41
Captains	90 (20)	4.7	173	3.9	75	155	65
Commanders	122 (10)	6.4	271	6.1	117	245	123
Lieutenant commanders	204 (4)	10.6	564	12.7	244	505	301
Lieutenants	351 (1)	18.3	1,272	28.6	550	1,145	794
Lieutenants (junior grade)	761	39.6	1,041	23.4	450	935	174
Ensigns	368	19.1	1,050	23.7	450	950	582
Totals	1,920	100	4,440	100	1,920	4,000	2,080

[1] The high percentages of captains and commanders are due to the numbers in those grades designated as "extra numbers" and who are in addition to the authorized total. Extra numbers are not included in column 5.

Column 2 shows the present distribution of the commissioned line officers in accordance with the percentages of the total. Column 4 shows what these percentages should be in order to make the distribution equitable, and column 5 shows the numbers that should now be in each grade in accordance with the percentages given in column 5. In order to make this redistribution there should be immediate legislation to the following effect:

Immediately on the passage of the act the various grades of commissioned line officers shall be readjusted so that the percentage of the whole number in each grade will be:

	Per cent.
Flag officers	1.6
Captains	3.9
Commanders	6.1
Lieutenant commanders	12.7
Lieutenants	28.6
Lieutenants (junior grade) and ensigns	47.1

Another section should provide that on the 1st day of July of each year an adjustment in the various grades shall be made on this same percentage basis, which shall remain effective for 10 years, when the Secretary of the Navy shall require a board of officers to recommend whether or not the percentage basis should be changed. Such readjustment to be made thereafter in accordance with the recommendations of the board.

So far as the commissioned line officers are concerned, these two provisions, together with the increase of midshipmen at the Naval Academy, are all that are necessary to place this personnel on a proper basis. That this is so will be demonstrated.

The first provision which requires an immediate readjustment would result in the following promotions: Sixteen captains to flag officers, 21 commanders to captains, 26 lieutenant commanders to commanders, 70 lieutenants to lieutenant commanders, 270 lieutenants (junior grade) to lieutenants.

The numbers thus promoted are not large when it is considered that in each case a greater number of officers are performing the duties of the next higher grade. This readjustment will remedy the injury done by the abolishing of the selection-out board and the policy of the Navy Department not to accept voluntary retirements.

Digitized by Google

All of the lieutenants (junior grade) who would be immediately promoted are now performing the duties of the senior grade, and all of them will have been six years or longer in their present grade.

The provision for adjusting the numbers in each grade on the 1st of July each year will provide for the necessary flow of promotion. It has been shown that during the next four years there will be an average annual increase of 145 line officers. This total increase when properly distributed in accordance with the percentages recommended, will give a yearly increase in the allowed numbers in each grade as follows:

Flag officers	2
Captains	6
Commanders	9
Lieutenant commanders	18
Lieutenants	41
Lieutenants (junior grade) and ensigns	68

Therefore this annual readjustment, without the aid of resignations, retirements, and deaths, would result in the following numbers of promotions on the 1st day of each July:

Captains to flag officers	2
Commanders to captains	8
Lieutenant commanders to commanders	17
Lieutenants to lieutenant commanders	35
Lieutenants (junior grade) to lieutenants	76

But, even without the assistance of the selecting-out board and the voluntary retirements, we know from the results of recent years that the resignations, deaths, and retirements due to age and disability will make the following averages in promotions:

Above the grade of captain	7
Above the grade of commander	9
Above the grade of lieutenant commander	12
Above the grade of lieutenant	16
Above the grade of lieutenant (junior grade)	22

These added to the numbers to be promoted due to the annual increase in the various grades will give an average yearly advancement as shown below:

Captains to flag officers	9
Commanders to captains	17
Lieutenant commanders to commanders	29
Lieutenants to lieutenant commanders	51
Lieutenants (junior grade) to lieutenants	98

Four years after the 1st of next July the total line officers would (owing to the increase in midshipmen) be augmented annually by 250. We would then have during the six years following an average increase in each grade as follows:

Flag officers	4
Captains	10
Commanders	15
Lieutenant commanders	32
Lieutenants	72
Lieutenants (junior grade) and ensigns	117

This would result in the following promotions on the 1st day of each July:

Captains to flag officers	4
Commanders to captains	14
Lieutenant commanders to commanders	29
Lieutenants to lieutenant commanders	61
Lieutenants (junior grade) to lieutenants	133

As the total line officers increase, the number of vacancies due to resignations, deaths, and retirements for age and disability must increase also, so the average yearly vacancies created from these causes during the six-year period may reasonably be counted on as—

Above the grade of captain	10
Above the grade of commander	13
Above the grade of lieutenant commander	17
Above the grade of lieutenant	22
Above the grade of lieutenant (junior grade)	30

Digitized by Google

The following annual promotions would be obtained by adding these numbers to those showing the annual increase in the various grades:

Captains to flag officers	14
Commanders to captains	27
Lieutenant commanders to commanders	46
Lieutenants to lieutenant commanders	83
Lieutenants (junior grade) to lieutenants	163

The foregoing demonstrates the important fact that, if the present law requiring ensigns to serve as such for three years remains effective, and if new legislation is obtained doubling the number of midshipmen for a period of six years and fixing the numbers of officers in each grade on a definite percentage basis, we can, during the next 10 years, bring the line of the Navy up to a satisfactory strength and at the same time provide a proper flow of promotion without resorting to any schemes contemplating selection up, selection out, or the formation of an active reserve list.

The legislation necessary for the satisfactory operation of any plans requiring any form of promotion by selection is complicated. The opinions, both within and without the service, as to the best form of selection are numerous and varied. The best method for deciding who are to be selected has not been demonstrated to the satisfaction of a large majority of the officers concerned. Consequently, there is, at present, no prospect of obtaining any legislation pertaining to promotion by selection that will produce the desired results. There will be so much opposition to any forms of selection out or selection up that have been suggested or contemplated, that the mere presence of any such clause in a proposed bill will probably be sufficient to prevent its passage. Therefore the present needs for practicable legislation necessitates the elimination of any recommendation for promotion by selection. The greater efficiency that would result in satisfactory legislation of this character must be sacrificed owing to more pressing needs that have better prospects of being remedied. We need now, more than anything else, numbers and a proper flow of promotion. As both of these can be obtained by simple legislation that does not involve any method of selection, or the formation of anything resembling an active reserve list, every proper endeavor should be made to obtain the simple legislation, especially as the chances for passage are increased in proportion to the simplicity of the proposed bill.

It will be 10 years before sufficient numerical strength can be obtained to make it desirable or necessary to deplete the number of officers by any method of selection out or selection up. Before this time arrives there probably will have been organized a general staff composed of officers from all corps, and on which the seagoing personnel will be in the majority. Such a staff, created by act of Congress and containing some of the most efficient officers of all the various corps, will, of necessity, have the confidence of the Congress, which creates it, the Secretary of the Navy, and of the entire service. This staff will be able to devise the best and most satisfactory form of selection and to arrange the method for carrying it into effect.

The subject is one that requires the mature deliberation and action of such a staff. If, when the time approaches, indicating the necessity for promotion by selection, a general staff has not been created, it will be necessary to have a board appointed to make recommendations for the necessary legislation. But no board will be able to make a report that meets with the approval of and has the support of the service at large unless the board is composed in the main of seagoing officers both of the line and of the staff corps. As the various staff corps are in practically the same unsatisfactory numerical condition as in the line, any legislation for the purpose of improving personnel conditions must include those corps. It is essential that these corps be not discriminated against in any way, and therefore there should be enacted into law the following provisions:

First. That in the various staff corps the percentage of the whole number in each grade shall be the same as that authorized for the line.

Second. That for each annual increase in the number of line officers there shall be the same percentage of increase in each of the various staff corps.

These two provisions are all that are necessary to place the staff on an equitable footing with the line so far as numbers in each grade, total numbers, and flow of promotion are concerned.

To summarize, it is concluded that in order to take immediate steps to place the commissioned personnel on a satisfactory basis as soon as practicable endeavors should be made to have the following simple legislation enacted:

1. The doubling of the numbers of midshipmen for a period of six years.
2. The readjustment of the various grades of line officers on a proper percentage basis.
3. The retention of this percentage basis as the total number increases.

Digitized by Google

4. The staff corps to have the same percentages in each grade as authorized for the line.

5. The percentage of increase in the various staff corps to be the same as the annual percentage of increase in the line.

The active service, 10 years from now, should have 4,000 commissioned line officers, and 100,000 enlisted men. These numbers are only 75 per cent of the totals that would be required to man all the material in case of war. It will therefore be necessary to increase our available reserves to 1,350 line officers and 33,000 enlisted men. There are now this many officers if we include 650 undergraduates at the Naval Academy. Efforts should be made to produce this total without making it necessary to send the midshipmen to sea. The total of 33,000 men can be obtained if the undesirable portions of the naval reserve act are expunged and if endeavors are made to increase the Naval militia organizations. The naval militia is the best medium through which to obtain the necessary reserve officers.

Warning must again be given against the organization of reserves that are qualified for service in peace times only. The maintenance of such reserves is a waste of public money and their attempted training a waste of time. In addition, the presence of such a reserve on paper leads to a false sense of security that may prove disastrous when reliance must be placed on them in case of war. It must also be reiterated that such desirable organizations that may be composed of the fishermen, tugboat men and yachtsmen for the purpose of manning their own vessels in time of war, can not in any way be considered as an effective reserve so far as the manning of the regular Navy ships and shore stations is concerned.

CONCLUSION.

The apathy concerning the naval personnel has resulted in the adherence to false principles which account for the present unsatisfactory conditions. These false principles are:

First. The sacrifice of efficiency to economy.

Second. The subordination of the personnel to the material.

Third. The construction of new vessels and the establishment of additional shore stations without provision for the personnel necessary to man and to operate them.

Fourth. The restriction of the number of officers in each of the upper grades instead of having a percentage basis as the means for determining the number in each grade.

Legislation which will enable the Navy to abandon these false principles has long been needed. The European war has shown our people that preparedness is essential for successful military and naval operations. Our representatives in Congress appreciate this. They are ready to enact the required legislation provided the actual needs of the Navy are presented in clear and concise form, without the introduction of complicated and complex features. It has been shown that only simple legislation is necessary to produce the much desired improvements in our personnel situation. Therefore it would be better for the present, to abandon the advocacy of any legislation that by reason of its mere complexity may defeat the ends in view.

Although good men with poor ships are better than poor men with good ships, we must awake to the realization that in order to be successful in war as it is waged to-day we must have both good men and good ships in adequate numbers to make defeat impossible.

Capt. TAUSSIG. The inadequacy of the personnel, as shown by the report of the General Board, and by the figures deduced by the officers of the enlisted personnel division of the Bureau of Navigation, was clearly demonstrated at this time, 1915, and in the following years. As the department did not recommend and did not strive to obtain an increase in the personnel at this time, the efficiency of the entire Navy was clearly adversely affected both preceding and during the Great War.

This will be shown by quoting from official reports.

SERIOUS SHORTAGE OF PERSONNEL IN ATLANTIC FLEET.

In the spring of 1915, which was only a few months after the General Board recommended an immediate increase of 19,600 enlisted

Digitized by Google

men, and the Secretary reported no additional enlisted personnel was needed, Rear Admiral F. F. Fletcher, the commander in chief of the Atlantic Fleet, made the following report to the Navy Department on the personnel situation of the fleet:

Shortage of personnel.—The most vital weakness in the Atlantic Fleet is the shortage of officers. It takes approximately 10 years to educate and train an officer, and no amount of legislation can provide officers when trouble is imminent. Expansion of the Navy is limited by the number of officers available. The fleet is handicapped not alone by the shortage of officers but by the inexperience of the large number of young officers that have been added to the Navy in the past few years.

This condition, coupled with the shortage of officers, has resulted in officers being ordered to duties beyond their capacities and for which their experience and judgment do not fit them. Owing to the short enlistments, our men require continuous training, and any shortage of officers is certain to result in a lessening of efficiency. The shortage of officers is not confined to battleships, but exists in all types of ships. Second in importance to the shortage of officers is the shortage of men. The shortage of men is put as of secondary importance to the shortage of officers, since there will always be a reserve of trained men; and untrained men can be made efficient in much less time than is required for developing officers. The shortage of men in the Atlantic Fleet, coupled with the shortage of officers, has prevented the fleet from attaining the degree of efficiency that is to be expected. Too much emphasis can not be placed on what I believe to be the most serious weakness in the fleet to-day—lack of trained officers and shortage of enlisted men. To equalize the shortage in the different vessels there results a constant exchange of officers and men tending to promote instability and to weaken the efficiency of the various units of the fleet. With a few exceptions every vessel of the Atlantic Fleet is short of the complement of officers and men necessary for battle. The shortage of enlisted men in the battleships alone, as I reported in January, 1915, exceeds 5,000 men. It is evident that undermanned and underofficered ships can not be kept in a state of preparedness and efficiency to meet on equal terms similar types in other navies. I believe that all ships in full commission attached to the active fleet should be kept fully manned for battle, ready for any duty to which they might be called. In no other way can the units of the fleet be kept in a thoroughly efficient state.

Emphasis must be placed on this report of the commander in chief of the Atlantic Fleet, coming at a time when the department reported no additional enlisted personnel as necessary. It is an admission that the units of the fleet were not in an efficient state, and this admission is made by the commander in chief.

The CHAIRMAN. What was the date?

Capt. TAUSSIG. It was made in the spring of 1915, and immediately after the target practice that year. The exact date I have not, but it was in the spring of 1915.

That this shortage of personnel was felt by all classes of vessels, and was recognized by officers of wide difference in rank as very detrimental to efficiency, and that it did adversely affect the efficiency of the Navy, is shown by the following extracts taken from official reports made to the Navy Department in 1915 by fleet gunnery officer, Atlantic Fleet, Lieut. Commander, now Capt., T. A. Kearney.

The CHAIRMAN. These reports were made when?

Capt. TAUSSIG. These were all made in 1915, at the time that the department reported that we needed no additional personnel. [Reading:]

I feel that we can not too strongly urge that immediate attention be given to the question of providing an adequate and permanent personnel. Every problem, every exercise, every practice, that we have engaged in during the past year has but emphasized the fact that we have neither the officers nor the men necessary to the efficient manning of our battle stations. The constant changing of officers, coupled with the all too prevalent practice of assigning to juniors duty beyond their years, experience, and ability, is wrong. The unsatisfactory conditions as regards personnel are so apparently common to every organization in the fleet—battleships, destroyers, sub-

Digitized by Google

marines, and auxiliaries—and have during the past year been made the subject of repeated report.

Gunnery efficiency is concomitant with general efficiency, and both are directly dependent upon the efficiency of the commissioned and enlisted personnel.

Gunnery officer, Atlantic Fleet (Lieut. Commander, now Capt., T. A. Kearney):

"Improvement and incentive will also come if the department will direct its efforts—

"(*a*) To an increase in complements of both the enlisted personnel and commissioned personnel.

"(*b*) To the prevention of inopportune detachments of officers and transfers of men and to the creation of such impediments as will render discharge, either by pruchase or expiration of enlistment practically impossible, except during overhaul periods.

"Recent investigations along entirely independent lines fully confirm the contentions set forth in the target practice reports of the *Wyoming*, *Texas*, *Arkansas*, and *Georgia*, and other ships, that our present maintained complements, including both officers and men, are inadequate to even peace time target practice requirements. Continued cruising under war conditions would be physically impossible; even now, when continuing night and day practices are indulged in, a large percentage of the personnel remain more or less, continuously on active duty until the practices are completed. Not only do we lack a reserve to draw upon for replacements due to daily casualties, but we are so hard pressed to man existing and essential stations that a considerable proportion of both officers and men are doing double duty to the detriment of their paramount activities. Broadside battery crews are in part but paper organizations; and the personnel of handling room crews are all too frequently a heterogeneous combination of engineer's force, marines, and such other men as can be best spared from some other less exacting employment—men whose initial interest and allegiance are to other duties and divisions. These are conditions that exist to-day and have existed for some time. It is pertinent to ask what would we do should war be declared to-morrow.

"The shortages in personnel are as apparent in the flotilla as in the other vessels of the fleet. With the present complements it is manifest that the exacting requirements of continuous service could not be met."

Executive officer, U. S. S. *Florida* (Commander, now Capt., W. S. Crosley):

"It is a fact that every effort has been made to retain individuals at their stations in which they have drilled, and it is probable that the *Florida* does not suffer more than other ships on account of shifting personnel. However, it can not be denied that the complement is so small that the loss of one man is felt, and that the shifting personnel decreases efficiency."

Commanding officer U. S. S. *Georgia* (Capt., now Admiral, R. E. Coontz, Chief of Operations):

"The serious shortage of officers and men on board all battleships and especially the old ones, is a matter of record. The extreme seriousness of this condition must be known by the department."

Commanding officer U. S. S. *Kansas* (Capt., now Rear Admiral, H. F. Bryan):

"The existing shortage of personnel on ships of this class was shown by the means that had to be employed to man properly the 8-inch turrets of this ship."

Gunnery officer U. S. *Nebraska* (Lieut., now Commander, G. V. Stewart):

"This ship suffers severely from the lack of officers and men and more from the lack of permanence in their duties and stations."

Commanding officer U. S. S. *New Jersey* (Capt., now Rear Admiral, J. L. Jayne):

"The efficiency of a ship or a fleet at the commencement of war will depend upon its preparation before is declared, and if not ready with an aggressive enemy, there may not be an opportunity to complete the preparations before a disaster has occurred. It is therefore highly important that each ship in commission be kept ready. With the frequency with officers and men are now transferred, together with the scarcity of both, it is very difficult, if not impossible, to do this."

Gunnery officer U. S. S. *South Carolina* (Lieut., now Commander, T. G. Ellyson):

"There was a certain amount of artificiality in connection with this practice, owing to the shortage of complement."

Commanding officer U. S. S. *Utah* (Capt., now Rear Admiral, H. P. Niblack):

"At every battle drill or practice the serious shortage of trained officers and men in one particular or another is forcibly brought to our attention."

Commanding officer U. S. S. *Kansas* (Capt., now Rear Admiral, H. F. Bryan):

"* * * It must be admitted that we are not making progress in gunnery that we should. This lack of progress is believed to be due principally to two conditions which affect all ships—the shortage of commissioned and enlisted personnel; the constant shifting of the personnel."

Digitized by Google

Commander First Division, Atlantic Fleet (Rear Admiral Mayo):

"Particular attention is invited to the remarks of the gunnery officer, *New York*, relative to the lack of permanency of personnel and to the fact that the ship is underofficered and undermanned."

Gunnery officer U. S. S. *New York* (Lieut. Commander G. J. Rowcliff):

"I consider the lack of the permanency of the personnel the most fruitful producer of inefficiency that we have. It seems that it is impossible to depend on the continuance on board of either officers or men longer than to get a smattering of what is expected of them. Add to this that the ships are underofficered and undermanned and the situation resolves itself into one where stations are filled because the names are written in the book rather than because the individual is chosen to fill the station."

Gunnery officer U. S. S. *New York* (Commander G. J. Rowcliff):

"In previous reports I have made the statement that one of the principal reasons why our target practice work is crude and never progresses further than the elementary stages is that the personnel changes so fast that it is impossible to put the work on a stable footing. Everyone admits that the situation in regard to personnel has been growing more active day by day. Those responsible for the detail of officers and men have for some time been living an existence from hand to mouth because there is no reserve to call upon when it becomes necessary to fill vacancies."

Commander in chief Asiatic Fleet (Admiral W. C. Cowles):

"The *Saratoga* was at the navy yard, Olongapo, from the 19th of February until the 20th of May undergoing repairs, and during this time her ordinance officer was detached on April 1, and it was impossible to send any officer to the *Saratoga* to replace him. In the meantime there were 70 men in the deck force short of complement, and there was a shortage of officers in addition."

Executive officer U. S. S. *Florida* (Commander, now Capt., W. S. Crosley):

"The shortage in personnel, however, was amply emphasized by this practice * * *."

Gunnery officer U. S. S. *Rhode Island* (Lieut., now Commander, W. R. van Auken):

"There should be more officers on board to provide for war conditions.

"In order to simultaneously man both sides of the 6-inch and 3-inch batteries 75 more men are necessary.

"It is believed that the deficiencies and changes in personnel are the most important factors which prevent ships being at all times in a top-notch state of battle efficiency."

REPORT OF ELEMENTARY PRACTICE, 1915–16.

Commander Third Division, Battleship Squadron (Rear Admiral Coffman):

"The division commander can not too strongly impress upon the department the great handicap the ships of this division suffer because of lack of adequate personnel in men and officers. The allowed complements are considered far too small to properly man battle stations, and this deficiency is always accentuated by a shortage of personnel below allowed complements. Such a condition of affairs necessitates the doubling up of duties, some of which are more or less incompatible, with consequent loss of efficiency."

Commanding officer U. S. S. *Arkansas* (Capt., now Rear Admiral, W. R. Shoemaker):

"The pressing need just now for battle efficiency is a fair degree of performance in personnel. Absence of it is serious with the men, but especially so with the officers. Perhaps the *Arkansas* is no worse off than others, but these conditions do not conduce to efficiency."

Commanding officer U. S. S. *Utah* (Capt., now Rear Admiral, A. S. Halstead):

"The obvious defect in the ship is the lack of permanence of personnel, presumably caused by the shortage of officers and men. No lasting results will be obtained until some degree in permanency in personnel is brought about."

Executive officer U. S. S. *Utah* (Commander, now Capt., E. H. Watson):

"The incredible number of changes in officers and men in every ship is the principle reason for lack of efficiency."

The above reports just quoted mostly come from our battleships in full commission, those few ships which in accordance with the General Board and Commander in Chief should be fully manned at all times.

There are many other reports and letters in the files of the Bureau of Navigation and department which substantiate this deplorable condition of the personnel. In the Secretary of the Navy's annual report, dated December 1, 1915, recommendation was made that

Digitized by Google

Congress authorize an increase of 10,000 men, which would bring the total authorized enlisted strength to 61,500.

In 1915 the General Board recommended:

With full war complements for all ships of the Navy ready for service in 1917 and a minimum number required at shore stations 74,700 men will be needed. In addition upon the outbreak of war the personnel of the Navy must be greatly expanded to provide for aviation, coast-defense districts, patrol craft, and other auxiliary duties of every sort, as well as for a reserve of men under training to replace casualties. The Coast Guard, Naval Militia, and Naval Reserve will be far from sufficient to meet these demands. The Navy is the first line of defense of the country. For peace requirements in the fiscal year 1917 the General Board regards as inadequate any smaller force than 67,000 men in the regular Navy.

The department requested a strength of only 61,500 men, which was 5,500 less than the smallest force the General Board recommended for peace requirements. The General Board's estimate was figured on the inadequate complements allowed at the time, and not on the adequate complements recommended by the Commander in Chief and other officers. The department continued to take no adequate steps toward providing sufficient trained personnel for war purposes. The Naval Reserve law which had been passed would not provide trained men in large numbers for years to come.

The very unsatisfactory condition in which the Navy had become, owing to inadequacy of personnel, was fully appreciated by the Chief of Bureau of Navigation in August, 1916. He recommended to the department an immediate increase of enlisted personnel to an active force of 93,957 men. He also recommended that "from 5 to 10 per cent be added to this number for increased complements and working surplus, and the authorized enlisted strength should be increased to this number in time for the necessary recruiting and training." The reserves were considered to be necessary in addition to the above. While up to this time the department recommended an active force of only 61,500 men, we suddenly find the number jumping to 93,957 men plus 5 to 10 per cent for casualties, 10 per cent of this number would make the total for the three-year building program 102,000, or approximately 49,000 more than the department a few months previously had recommended.

The chief of bureau, Admiral Palmer, also recommended that in order to provide for the shortage of officers "that the appointments allowed each Senator and each Member of the House of Representatives be increased; that the course of the Naval Academy be reduced to three years until the shortage is made up; and that the present first class be graduated on February 1, 1917."

Congress authorized, on August 29, 1916, an immediate increase in the active enlisted personnel to 74,700 men and authorized the President in emergency to bring the total to 93,000. The Secretary had recommended only 61,500 men. This was the first really adequate steps toward placing the personnel on a proper footing.

These recommendations and the corresponding action of Congress came too late to permit having an adequate personnel by the time this country entered the war, a few months later. In the meantime the efficiency of the entire fleet was adversely affected as shown by the following official reports made to the Navy Department in 1916 and in the spring of 1917 up to the time of our actual entry into the war.

Digitized by Google

I will read extracts from some of these reports. These were in 1916. [Reading:]

SPRING OF 1916.

Fleet gunnery officer, Atlantic Fleet (Lieut. Commander, now Capt., T. A. Kearney):

"The demand for an increase in personnel has been general and insistent throughout all organizations of the fleet.

"With adequate complements and a permanency of detail we may reasonably expect a corresponding increase in general efficiency."

Commanding officer U. S. S. *New York* (Capt., now Admiral, Hugh Rodman):

"So much has been said by others concerning the frequent changes in personnel that there is little or nothing that can be added to it. Yet if is one of the glaring causes of poor target practice. * * *

"This (team work) can not be obtained when officers and men are continually changed, as at present."

Gunnery officer U. S. S. *South Carolina* (Lieut., now Commander T. G. Ellyson):

"Failure to obtain better results from gunnery in the fleet is primatily due to the fact that the officers who are running the gunnery jobs have not the necessary rank or experience. * * *"

Gunnery officer U. S. S. *Arkansas* (Lieut. Commander, now Commander, D. A. Weaver):

"Lack or permanency of personnel seriously affects the battle efficiency of the fleet * * *."

Gunnery officer U. S. S. *New Jersey* (Lieut., now Commander, L. N. McNair):

"There are not enough officers on the ship to properly man all battle stations and at the same time carry out the requirements of the Navy Regulations. * * *"

"There are not enough men on the ship to properly man 6-inch and 3-inch batteries while all other battle stations are manned."

Gunnery officer U. S. S. *Wyoming* (Lieut., now Commander, R. S. Holmes):

"The shortage in personnel was especially noticeable at division practice. Handling-room crews were depleted to such an extent that continuous loading would have been impossible. The shortage and lack in permanence of personnel is most discouraging."

Gunnery officer U. S. S. *San Diego* (Lieut., now Commander, G. C. Pegram):

"The ship is seriously handicapped by the shortage of personnel and officers to properly man the complete battle stations without having to shift from one station to another. This and the constant shifting of personnel prevents attaining a high state of efficiency."

REPORT OF BATTLE PRACTICE, AUTUMN, 1916.

Commander battleship force, Atlantic Fleet (Vice Admiral Coffman):

"During the preparation most of the ships in one way or another called attention to the shortage and changes in personnel and in some cases to the lack of suitable material for training. This condition is well known and a matter of record and considerable correspondence, and will not be enlarged upon. It is sufficient to say that adequate personnel is essential not only to man the battle stations, but there must be a reserve to draw on in order that expirations of enlistments may be adequately anticipated."

Commander battleship division 5 (Rear Admiral Dunn):

"The division commander is of the opinion that the paramount cause for the failure of the above-mentioned ships to make a better showing was due to their long stay at navy yards with reduced complement and lack of permanence in personnel."

Commander battleship division 7 (Rear Admiral T. S. Rodgers):

"During the year ending September 30, 1916, the *Florida* took up on the pay rolls 33 officers and transferred 25; the *Florida* received 530 men and transferred 535. The *Utah* received 36 officers and transferred 25; the *Utah* received 466 men and transferred 512. A fair degree of permanency of personnel is necessary for a high standard of efficiency, and no amount of drill and standardization can counteract the evil effects of constant changes in personnel."

Gunnery officer U. S. S. *Arkansas* (Lieut., now Commander, W. E. Eberle):

"The same obstacles which always exist, lack of permanency of personnel and lack of time for training were met with in the preparation for this practice. * * * If the first obstacle, lack of permanency of personnel, can be overcome, the second one, lack of time for training, will automatically disappear."

Turret officer U. S. S. *Arkansas* (Lieut., now Lieut. Commander, Monroe Kelly):

Digitized by Google

"In the preparation for short-range battle practice one of the greatest troubles the division officer had to contend with was the frequent changes in personnel. It has been stated quite often that one reason why our work in target practice is so crude and never progresses beyond a certain stage is that the personnel changes so fast that it is impossible to put the work on a stable footing."

Commanding officer U. S. S. *Michigan* (Capt., now Rear Admiral, Brittain):

"It has been necessary to train almost a complete new outfit of pointers for each broadside and turret gun, due to the big changes being continually made in the personnel."

Gunnery officer U. S. S. *Delaware* (Lieut., now Commander, Logan Cresap):

"No other fact has been so forcibly brought out by this practice as the effect of shifting personnel. Altogether some 28 officers on this vessel were utilized in conducting the ship control, fire control, and gunnery work. Of these some 15 (including the commanding officer, executive officer, navigator, and gunnery officer) or some 55 per cent had joined the ship since she last fired, and 6, or 22 per cent, were in the same or equal positions as held on previous practice. Figures can be given on loading crews, pointers, etc., but figures are unnecessary in this report in this respect. Suffice it to say that the situation was as bad, if not worse with the crew than with the officers.

"* * * Altogether the complement of the ship is short, on a peace basis, some 75 men."

Gunnery officer U. S. S. *Minnesota* (Lieut., now Lieut. Commander, J. H. Collins):

"The same trouble is still being experienced with lack of permanency of personnel. For several years this unfortunate condition has existed, and there seems to be no immediate relief in view."

Gunnery officer, U. S. S. *Texas* (Lieut., now Commander, H. L. Pence):

"On this ship there is a serious lack of men to properly man stations for battle."

Commanding officer U. S. S. *Vermont* (Capt., now Rear Admiral, H. O. Stickney):

"The necessity for permanence of personnel can not be too much emphasized. So long as the Navy has too few men to man those ships that must be kept in service, just so long will it be inevitable that many changes will be required, and ships will often be short-handed. To remedy this there should be a surplus of men. * * *."

Commander battleship force, Atlantic Fleet (Vice Admiral Coffman):

"The commander battleship force considers that the provision at all times of an adequate personnel is necessary. It is apparent that a large number of faults of material are chargeable in the final analysis to the inadequacy and inexperience of personnel, caused by the fact that there has not been available an excess of personnel for training in time of peace.

"The deficiencies in operation can best be handled by improving the methods and opportunities for training. In this respect there are two fundamental difficulties that can not be well handled by the commander battleship force. In order that the personnel may be highly developed, it is necessary that there be maintained on each ship not only a full complement of officers and men, but a surplus complement in order that reliefs for anticipated vacancies may be put in training to occupy designated positions when prospective vacancies occur. This condition, it is evident, is very hard to realize, but it is hoped that eventually the effectiveness of training and the efficiency of operation may be increased by a proper adequacy and permanence of personnel."

Those are the reports we had up to the 1st of January, 1917, a few months before we entered the war.

The foregoing extracts deal almost entirely with the condition of the battleship force up to a few months before our entry into the war. It should be pointed out that the battleships were, on the whole, better provided with personnel than any other force.

These quoted extracts taken from official reports show:

1. That the entire Navy, for several years prior to the entrance of this country into the war and up to the time of actual hostilities was not as efficient as it should be owing to lack of necessary personnel.

2. That this state of affairs was reported to the department by the General Board, by the commander in chief of the Atlantic Fleet, and numbers of other officers.

3. That the department took no adequate steps to remedy the situation.

Digitized by Google

4. That the department's policy in regard to personnel was one of unpreparedness rather than one of preparedness.

It is not my province to point out the result of this lack of preparedness policy so far as it affected the entire Navy during the war, as there are many with first-hand information that can do this better than I.

However, as I commanded destroyers before and during the war, and was for some time the senior destroyer commander in the Navy, I desire, with the committee's permission to make a statement in regard to this service.

The CHAIRMAN. What committee is that?

Capt. TAUSSIG. With regard to the destroyer service.

Before leaving the Bureau of Navigation in 1915 it was necessary in order that destroyers recommended by the General Board to be kept in full commission be retained in this status to reduce their then allowed peace complements by 25 per cent. After a trial was given in operating on these reduced complements the experiment proved a failure, and the old complements were reestablished. However, the reestablishment of these old complements did not mean that the destroyers would be provided with the personnel required. In fact, they could not be so provided, as the personnel was not available; it did not exist, and it was manifestly impossible to provide that which did not exist.

The following extracts from the official reports made during 1916 show how the bad personnel situation affected the destroyers.

These are the reports made during the year previous to our entry into the war. [Reading:]

Commander Destroyer Force, Atlantic Fleet (Rear Admiral, now Admiral, Gleaves):

"Throughout the period of training the complements of ships were short, so much so, in fact, that from time to time it became necessary to transfer men from ship to ship in order that all vessels might operate. Such transfers frequently broke up gun crews and pointer groups in training."

(This is followed by a table showing the average per cent of vacancies in the 24 destroyers to be 15 per cent of their allowed complements.)

Spring and fall, 1916.

Gunnery officer U. S. S. *Nicholson* (Lieut., now Lieut. Commander, L. C. Shiebla):

"The shortage of personnel made it necessary to employ men at stations that they could not man in time of war."

Gunnery officer U. S. S. *Nicholson* (Lieut., now Lieut. Commander, L. C. Shiebla):

"This ship is operating on a reduced complement, which makes it necessary to employ engineer's force on stations that should be manned by deck force. Consequently either the battery or the engineer's work is neglected."

Gunnery officer U. S. S. *Nicholson* (Lieut., now Lieut. Commander, L. C. Shiebla):

"* * * it is felt that the practice was artificial, inasmuch as there were not enough officers and men on board to properly man the battle stations necessary for war conditions."

Gunnery officer U. S. S. *Aylwin* (Lieut., now Commander, J. S. Barleon):

"The present reduced complement absolutely necessitates the use of every man in the deck force as a member of a gun's crew.

"It is considered that five officers is the minimum requirement for a war complement of vessels of this type.

"The present reduced complement is utterly inadequate."

Commanding officer U. S. S. *McDougal* (Lieut. Commander, now Commander, A. P. Fairfield):

"The practice showed conclusively that four officers are not sufficient in time of war.

"If a destroyer is worth the time and money spent in preparing her for war, she is also worth the slight additional cost of two more officers to afford her the protection of accurate gunfire."

Digitized by Google

Commanding officer U. S. S. *Wadsworth* (Lieut. Commander, now Capt., J. K. Taussig):

"The complement, both officers and men, is not sufficient for a proper ship control, guns and torpedo tubes, and at the same time keep an adequate ammunition supply and run the engines with fires under all four boilers."

Gunnery officer U. S. S. *Balch* (Lieut. J. M. Cresap):

"The shortage in personnel is an ever-present handicap, one gun crew being composed of a ship's cook, coppersmith, and four firemen. There are not enough men on the ship to man all guns and torpedo tubes, magazines, and handling rooms with enough men below for full-power steaming, as would be necessary in time of battle."

Commanding officer U. S. S. *Dale* (Lieut., now Commander V. K. Coman):

"* * * with a shortage of one-seventh of the ship's company, are the direct and attributable reasons for the division as a whole not making better success."

Gunnery officer U. S. S. *Ericsson* (Lieut., now Lieut. Commander R. M. Doyle, jr.):

"This ship was placed at a serious disadvantage on account of nonpermanence and shortage of men."

Commanding officer U. S. S. *Jacob Jones* (Lieut. Commander, now Commander W. S. Pye):

"This ship has been from 12 to 14 men short of her complement during the preparation period."

Commanding officer U. S. S. *Wainwright* (Lieut. Commander, now Commander F. H. Poteet):

"During the quarter in which this practice was held this ship had 85 changes in personnel."

The bad effect of this shortage in personnel, together with the operations of the destroyer force during the year preceding the entrance of the United States into the war, is shown by the unsatisfactory results of the target practice for the year preceding the war. These target practices were held, of course, with the view of making ships efficient for war, and as many vessels as possible were supposed to take part in them. However, only seven destroyers of the whole force held a sufficient number of practices during the year to be classified in the usual manner. In regard to this the department announced to the service in reference to the destroyers:

The gunnery trophy will not be awarded for the gunnery year 1916 because of the small number of vessels completing the year's work and because the scores obtained by these vessels do not warrant the award of the trophy.

Therefore, it is seen that at the outbreak of war even the department recognized that the destroyer force was not as efficient as it should be.

OVERHAUL OF DESTROYERS.

It was customary for the destroyers to go to the navy yards twice a year for overhauling. These periods usually came in the spring and fall.

From January to April, 1917, the destroyer I commanded, the *Wadsworth*, was operating with the fleet in West Indian waters. In addition to carrying on the prescribed target practices, we were, after diplomatic relations were broken off in Febraury, employed on patrol duty and in picketing the fleet. The service was unusually hard and arduous. In fact, from January 8, 1917, the day the *Wadsworth* left the navy yard, until April 13, 1917, the day orders were received to proceed to the navy yard to prepare for distant service—a period of 99 days—the *Wadsworth* was actually under way on 75 of these days. As a result we had had practically no time for general overhauling of hull and machinery.

The other five destroyers selected to accompany the *Wadsworth* had been operating in a similar manner.

Digitized by Google

Although I had nothing to do with the selection of the six destroyers which composed the first division to be sent across, I understood that they were selected as being in the best state of preparedness at the time. Although these six destroyers were in fairly good condition, they were, after three months of hard and continuous duty, approaching the time when they should go to the navy yards for their regular spring docking and overhauling, the necessity for which was beginning to be apparent.

Instead of a thorough overhauling we had six days in which to dock and make repairs and to prepare for distant service, and for any and every duty on which we might be called.

What this duty was to be we did not know. The division, without tender or supply ship and without knowledge of how or where our next supplies were to be obtained, sailed under sealed orders for an unknown port.

As an example of what had to be done on account of the lack in personnel preparedness, my experiences while commanding destroyers operating in the submarine danger zone may be cited.

For every new destroyer placed in commission, 25 of the best men of their crews were taken from those destroyers actually operating in the face of the enemy in order that these new destroyers could have any really trained men at all.

This resulted in practically all destroyers that remained in the danger zone a year having nearly a complete turnover in their crews. This instability of personnel was the greatest detriment to efficiency. While the destroyers could operate against submarines with some degree of success, I am safe in saying that not a single one of our destroyers in the war zone, shortly after the turnover in personnel commenced, was in really satisfactory or efficient condition for taking part in a fleet action or engaging enemy destroyers. If it had been the intention for the destroyers to engage in such operations it would have taken at least a four months' period of preparation with stable crews away from the war zone before they could have been expected to operate successfully.

It is recognized that this procedure of depleting the class of the destroyers in the war zone was absolutely necessary under the existing conditions of lack of trained personnel in order that the new destroyers could operate. In fact Admiral Palmer, the chief of Bureau of Navigation, cabled Admiral Sims that unless this procedure was taken proper personnel could not be provided for the new destroyers. But such procedure should not have been necessary, nor would it have been necessary had our personnel been adequate at the beginning of the war.

CONCERNING THE NEW DESTROYERS.

I was one of the first destroyer commanders sent home from the war zone to take command of the new war program destroyers. My orders assigned me to duty in connection with the U. S. S. *Little* and to command that vessel when commissioned. The *Little* was the first of the war program to be completed. Owing to delays for various reasons, she was not placed in commission until April 6, 1918, one year after we entered the war.

Digitized by Google

All destroyer commanders placed in charge of fitting out these new vessels had the greatest difficulty in obtaining suitable crews. In fact it was not possible to get suitable crews, because the trained personnel did not exist. Each crew was made up approximately of 25 men returned from the war zone, of about 25 additional trained men that were picked up from various sources, and about 50 men with practically no seagoing experience. We could and did operate on convoy duty immediately on being placed in commission.

It would have required a long period of training before we could have operated efficiently or successfully against enemy destroyers or have taken part in fleet action.

SUMMARY OF EVIDENCE.

To summarize the testimony just given it is evident that the following facts have been established:

1. That when the World War started in 1914 the personnel of the United States Navy was entirely inadequate for peace purposes and deplorably deficient should this country be thrown into the war, an event which was apt to occur at any time.

2. That this deplorable and unsatisfactory condition of the personnel was brought to the department's attention by the General Board of the Navy, by the commander in chief of the Atlantic Fleet, by the officers of the Enlisted Personnel Division of the Bureau of Navigation, and by many other officers of high rank.

3. That these same officers made repeated and emphatic recommendations to the department that immediate steps be taken to remedy these unsatisfactory conditions, showing conclusively in their reports and recommendations that the efficiency of the entire Navy was adversely affected by the great shortage of personnel.

4. That the department not only ignored these recommendations but took steps to prevent the reports as to the unsatisfactory personnel conditions from being made public, and the Secretary of the Navy in his annual report to the President in the fall of 1914 stated that the numerical strength of the enlisted personnel was adequate, and in his report of 1915 that only an additional 10,000 men were needed, while the General Board in its 1914 report had stated that 19,600 men were immediately needed.

5. That the department did not take adequate steps to provide personnel absolutely necessary for proper conduct of the Navy on even a peace basis, with a result that when this country entered the war in 1917 the ships of the fleet were not as efficient as they should have been and for a large number of ships there was no trained personnel at all.

6. The policy of the department in regard to personnel was one of unpreparedness rather than of preparedness. Such steps as were finally taken were too late to place the personnel on a proper basis by the time this country became involved in the war a few months later.

7. That as a result of this department policy of unpreparedness the larger part of the ships of the Navy operated throughout the war with inadequately trained personnel, and in consequence they were not as efficient as they should have been.

Digitized by Google

8. That the efficiency of the destroyers in the war zone was decreased by the necessity caused by our unprepared personnel of sending many of their most efficient men to the United States to form nucleus crews for the new destroyers.

9. That unless these nucleus crews had been taken from those destroyers actually operating in the face of the enemy the department would not have been able to provide sufficient trained personnel for the new destroyers to permit their operating.

10. That the new destroyers commissioned during the war were not efficient for fighting purposes on account of the large proportion of untrained personnel on each one.

The CHAIRMAN. Then, Capt. Taussig, what have you to say in regard to the statement of the Secretary of the Navy in his annual report of 1918 that the Navy from stem to stern had been made ready to the fullest extent possible for any eventuality?

Capt. TAUSSIG. I think, sir, that my statement here covers that.

The CHAIRMAN. You would not say that the personnel of the Navy was ready?

Capt. TAUSSIG. No, sir.

The CHAIRMAN. You have spoken of many changes in personnel on the ships of the Navy. Was that a necessity, to make the changes as they were made?

Capt. TAUSSIG. The instability of the personnel, that is the lack of permanency of officers, was caused entirely by the inadequacy of the numbers. The whole system of providing personnel was one from hand to mouth. There was practically nobody on the receiving ships to fill any vacancies. The consequence was that men were discharged at the expiration of their enlistments, and there was nobody to fill their places, and a man's place was not filled until some man turned up. That could only have been prevented by an adequate personnel. There was no possible way of preventing shifting, so long as we did not have sufficient numbers.

The CHAIRMAN. It was not the custom to assign men to battleships, for certain training on battleships, and then to assign them to destroyers?

Capt. TAUSSIG. Not prior to the war; no, sir. They had to do that after the war commenced, in order to get a trained personnel.

The CHAIRMAN. But prior to the war that was not the system employed in the Navy.

Capt. TAUSSIG. No, sir; we did not have them to train in that way. There were not enough men to fill the complements, much less to have any men on board to train.

The CHAIRMAN. I think you have stated that Admiral Fletcher said it would take 10 years to thoroughly equip an officer.

Capt. TAUSSIG. Yes.

The CHAIRMAN. That does not mean, does it, that officers could not be equipped to be of value in the Navy in a much shorter time.

Capt. TAUSSIG. Why, no, sir. It means that an all-around naval officer, one who should be able to perform any duty and every duty commensurate with his rank, can not be trained in less than 10 years.

The CHAIRMAN. In other words, officials for the higher commands?

Capt. TAUSSIG. Not necessarily the very highest commands. Subordinate officers on the battleships, such as the heads of various departments, the gunnery officer, the navigator, and men of that

Digitized by Google

sort, those officers, in order to be efficient, require at least 10 years' service. We can not possibly do it in less than 10 years.

The CHAIRMAN. But if the recommendations of the officers of the fleet in regard to increase in personnel and in officers, made in 1914 and 1915 had been followed, it would have been possible to have trained officers who would have been of use after the war began.

Capt. TAUSSIG. Oh, yes, it would have given us those younger officers that much sooner and given them that much more training.

The CHAIRMAN. And it would have released the other officers for higher duties.

Capt. TAUSSIG. It would have released them for higher duties. They would have stepped up. It was a step-up process anyway. It was an essential process where the younger officer had to fill the place of the older officer, because the older officer was needed for something else higher up.

The CHAIRMAN. Senator Trammell, have you any questions to ask the witness?

Senator TRAMMELL. Admiral Fletcher made that criticism in what year?

Capt TAUSSIG. In the spring of 1915, sir.

Senator TRAMMELL. If you would take that literally then you would have had to start in 1905 with the getting ready of more officers for this war than could have been prophesied probably in 1917—I mean, if we were going to rely upon his statement?

Capt. TAUSSIG. There was a great difference——

Senator TRAMMELL. The present Secretary was not in charge of the Navy Department in 1905, was he?

Capt. TAUSSIG. No, sir.

Senator TRAMMELL. Construing his criticism literally then there was a neglect on the part of the Navy Department in 1905?

Capt. TAUSSIG. No, sir, I do not agree with you there. There were steps being taken in 1905. The great trouble came when the big extension of the matériel of the Navy commenced. The big expansion of the matériel, when those big battleships began to go out, was after 1905. Practically up to 1912 the personnel situation was not acute, because we did not have so much material. It became acute in 1912, when Congress then authorized that the strength be placed at 51,500. In 1905 there was no war imminent. In 1914 there was war imminent, and all the officers of high rank in the Navy believed we were going to be forced into that war, and not only the officers of the highest rank believed that, but the lower ones like myself.

Sanator TRAMMELL. The point I have in mind is that you have always got to be anticipating war 10 years in advance, so far as your officers are concerned, according to his statement, and I do not know of anybody in this country who is so prophetic in his vision of the future that he can anticipate a war 10 years ahead, if it is a matter of preparing for war that is imminent.

Capt. TAUSSIG. There were a good many who anticipated it, sir.

Senator TRAMMELL. That is what you would call purely a matter of guess.

Capt. TAUSSIG. No, sir, it is a study of history.

Senator TRAMMELL. A good many people thought that the world was coming to an end.

Digitized by Google

Capt. TAUSSIG. But they had no historical evidence to go by.

Senator TRAMMELL. The Good Book says that there shall be wars and rumors of wars, and soon the end will come. They thought the world would have come to an end by now, but it has not come to an end yet, so you can not always tell about those things.

In 1916, when the recommendation was made that the Navy be increased to 93,750, with a margin of 5 to 10 per cent additional, do you know whether or not that legislation was favored by the Navy Department?

Capt. TAUSSIG. I know this: That in the Secretary's annual report for 1915 he stated that an increase of 10,000 men, which would make the total 61,500, was all that we needed. I know that the testimony before the committee which resulted in a big increase, showed a decided adversity on the part of the Secretary at that time to this increase; that the General Board, represented by Admiral Badger before the committee, made an urgent appeal for the increase, and that the legislation was made, I think, because Congress appreciated that it was necessary—not because the department urged it. That is my view of the situation.

Senator TRAMMELL. That is your view of it, but do you not know whether the Secretary recommended that increase or not in August, 1916?

Capt. TAUSSIG. The only official recommendation of the Secretary that I have seen was in his annual report of 1915, made a few months before these hearings of the committee were held, in which he said that only 10,000 more men were needed. That is all I can give you on that, sir.

Senator TRAMMELL. In the same month in 1915 was the General Board recommending ninety-seven thousand and odd men? Have you any evidence to show that the General Board at that time recommended any more than the 10,000 additional?

Capt. TAUSSIG. The General Board said that——

Senator TRAMMELL. I think you said that they recommended about 5,000 more than the Secretary recommended at that time.

Capt. TAUSSIG. I happen to know something about the inside workings of the General Board at that time, but I do not think it is in my province to tell it because I was not there, and I would suggest that some member of the board be called on to tell you. I do know this—that the General Board knew they had to submit figures that the Secretary would accept. I know that they were restricted.

The CHAIRMAN. Who was at the head of the General Board at that time?

Capt. TAUSSIG. I think Admiral Dewey was still at the head of it. I know that they were restricted in their recommendations, and in order to get this critical situation before the public they were restricted to making a report that the Secretary would accept, and all their figures were founded on this basis. Now, for instance, I know how they arrived at the figures that 67,000 men were the least number that they would be willing to recommend—67,000 the least possible number. They based this on the very inadequate complement which the ships then had, which everybody knew to be inadequate. They took those complements. They did not take the complements that were really needed. If they had taken the complements that were really needed, as it came out afterwards, they would have had

Digitized by Google

to ask for approximately 93,000 men, and it was shown that the day we went into the war we should have had at least 106,000 men in the Navy—that is, to be on board the ships and man the necessary stations on that day. That is what we should have had, and we were very far short of it.

Senator TRAMMELL. The point I am getting at is that you stated that the General Board and the secretary differed in the latter part of 1915 to the extent of less than 5,000 men in what they asked for in this increase?

Capt. TAUSSIG. I said they differed in that, in the report of the General Board on the peace basis, not for preparation for war. This was to maintain the ships as if no war was in sight, and that they said it was the smallest number that they were willing to say, and that they had to come down to a small number because they knew that if they put in a big number that recommendation would never get out.

Senator TRAMMELL. I understand what you are trying to do. You are trying to make it appear that the secretary in August, 1916, did not favor the bill that was passed at that time, as far as personnel was concerned. So far the logic of your suspicion and your contention is that he had recommended in the latter part of December considerably less. Now, your own testimony shows that in the year 1915 the General Board recommended only 74,700. Then, if the secretary is guilty of not being in sympathy with this measure in 1916, in August, and you based it upon the fact that his recommendation was less in the latter part of 1916, why is it that you do not say that the board were opposed to it because they recommended less in the latter part of 1915?

Capt. TAUSSIG. You will notice that the way the General Board reported is that they came in with this minimum number. They had to come down to the minimum. Every officer in the Navy knew that if we went into the war we would need over 100,000 men. There is no question about that. The figures in this report show conclusively that the General Board were restricted. That is the whole trouble. The General Board were not free to come out with what they thought, because if they came out with what they thought, they could not get anything out at all. Ask Admiral Fiske what happened. I suggest that you ask him. He was there, and he can give you the actual information as to why even the figures of the General Board are inadequate. I will admit that those figures were inadequate, and the General Board knew they were inadequate, but they had to do it to get anything.

Senator TRAMMELL. The point in my mind is that I can not quite see why you charge the Secretary of the Navy with not being in favor of this, and base it upon these figures, and yet you do not charge the General Board with that. That is the point I am getting at. In other words, you seem to think that the General Board had a right to revise its figures, but that the Secretary of the Navy did not have a right to revise his figures six months afterwards.

Capt. TAUSSIG. After this legislation went through the secretary came out and praised it very highly. In fact, I think he came out in his annual report, and stated afterwards that this legislation, which brought the Navy up to a total of 93,000 men, was the first time that adequate legislation had been provided.

Digitized by Google

Senator TRAMMELL. Your idea then was that they should have made preparation in 1914 for a war that did not come for five years later?

Capt. TAUSSIG. Yes; that is my idea.

Senator TRAMMELL. I suppose if we had not gotten into the war though, you would have considered that this country had pursued a very wise policy in not expending an enormous amount of money in preparing for five years for a war that they did not get into?

Capt. TAUSSIG. No, sir; I think we ought always to be prepared for war.

Senator TRAMMELL. That is a difference of opinion.

Capt. TAUSSIG. I am only stating my opinion, sir. My opinion is that we should always be prepared for war.

Senator TRAMMELL. I find that a good many people think this country should not be a military power and maintain an enormously large Navy at an enormous expense to the people of the country, and that it should not maintain an enormously large Army in peace times. Some others think you should do it. That is purely a matter of opinion. You favor that and the Secretary does not favor that. I think I do not care to ask any more questions.

The CHAIRMAN. Capt. Taussig, the increases you speak of that you and other officers recommended in the personnel, were not the necessary number for a war basis, were they, for the Navy?

Capt. TAUSSIG. This minimum number, this 67,000, were in order that the ships could have their peace-time complement, the minimum number of men to be in the service in peace times. For instance, as I say, when we went into the war, I can give you exactly how many our ships did not have on board in personnel, if you would like to have it.

The CHAIRMAN. I think it would be well to put that into the record.

Capt. TAUSSIG. On March 31, 1917, the last date of complete record prior to the entry of the United States into the war, we had in full commission 250 ships. We had what were known as in reserve, with considerably less than half their complements on board, 47 ships. We had what were known as in ordinary, 16 ships with just barely enough men on board to prevent absolute deterioration. We had out of commission with no Navy personnel on board 51 ships. Now these are the figures as they were on the 31st of March, 1917, six days before we declared war. That was the last complete compilation. The total number required to man those ships, even with their inadequate peace complement, was 72,622, which was considerably more than we had in the Navy at that time.

The CHAIRMAN. But to give them an adequate complement and to keep up with the building program that had been laid out, the 97,000 recommended by Admiral Palmar would not have been any too many?

Capt. TAUSSIG. It would not have been enough to put them in condition for war and to run the shore establishment. Of course we could not take everybody off the shore.

The CHAIRMAN. And that had not anything to do with the general plan of increase for the war such as came up later on?

Capt. TAUSSIG. No. I can not give firsthand information on that. The further increase to 137,000 was forced through after that.

Digitized by Google

The CHAIRMAN. It was simply a plan to put all the ships that we had in the Navy at that time on a basis where they would be ready in case war came up, was it not?

Capt. TAUSSIG. Yes. I should like to call your attention to the fact that in this paper I spoke of only 75 auxiliaries that would immediately need to be manned by Navy crews the instant we went into the war. The General Board in some report which I saw about that time said that the required number of auxiliaries would be at least 400. The number of 106,000 which I deduced came up only on a basis of 75 instead of 400 auxiliaries. Of course, we knew that those figures were based on the number required immediately, the day we went into the war. We all knew we would have to get an enlarged number of men in addition to that to be trained, and for the expansion of the shore establishment. We could not abandon that. You can not run ships without people on shore to look out for them. That is an impossibility.

The CHAIRMAN. I do not think this is within your province, but for the information of the committee can you tell me whether it is customary for the Secretary of the Navy or the Chief of the Bureau of Operations to consult with the General Board before a report is made by the board?

Capt. TAUSSIG. I do not know, sir.

Senator TRAMMELL. I want to ask you a little about those ships. Had any of those ships that you say were not manned at that time been practically discarded because they were out of date as far as more modern equipment and more modern war vessels were concerned?

Capt. TAUSSIG. Yes, sir; there were a few.

Senator TRAMMELL. Did you think they ought to keep those constantly manned?

Capt. TAUSSIG. I think we should not in time of peace carry any ship on the Navy list that we are not going to use in war, and that therefore every one of those ships being required, if only for housing purposes, for housing the men, for which purpose we did not have enough, every one of those ships would have to be used, and would have to have men on board them to take care of them.

Senator TRAMMELL. The main trouble then was that they were on the list. It was not the main trouble that they did not happen to be manned?

Capt. TAUSSIG. Every one of them was used in the war. They were not all used to fight with, but every one of them was used. Although some of those ships are put down as unfit for war purposes, even the few that were so put down were used for housing purposes or something, and we had to keep men on board them, and men were kept on board during the war. Out of the 400 I think about 12 were classified by the department as unfit for war service, but as I say they were used for housing purposes or something.

Senator TRAMMELL. Did you have any trouble in getting men to put on them during the war—ships of that character?

Capt. TAUSSIG. Of course we had trouble.

Senator TRAMMELL. Did you not put men on them?

Capt. TAUSSIG. Yes; there were men eventually put on everything.

Senator TRAMMELL. In other words, you think those ships that

Digitized by Google

were put down as unfit for war should have had a full quota of men on them from 1914?

Capt. TAUSSIG. I think we ought to have commenced in 1914 to put on the full quota, which we did not do. I will not say that those ships had to have the same number of men as if they were going to fight, but they had to have a certain number of men on board to keep them in a sanitary condition.

Senator TRAMMELL. Why did you not tell us in the first instance that there were a number of those ships that were unfit for war purposes, instead of trying to create the impression that they had 50 ships with no men on them, and that it was a great neglect to have no men on them, although you knew there were 12 of them that were put down as being unfit for war purposes?

Capt. TAUSSIG. I do not understand your idea at all, sir.

Senator TRAMMELL. I just want to get at the fairness of the situation.

Capt. TAUSSIG. I wish to state emphatically that I have said nothing with any idea of creating a wrong impression in any way. I have quoted from official documents throughout to substantiate what I have said, and I can not believe anybody around here thinks I am trying to create a wrong impression. I am out to tell the truth.

Senator TRAMMELL. Part of it, but not all of it.

Capt. TAUSSIG. If I told all the truth, sir, I would be here a week.

Senator TRAMMELL. That is what we want you to do, to tell all the truth. You may feel that it is exceedingly fair to try to make it appear that the Secretary of the Navy was not in favor of 97,000 men in August, 1916, because he recommended less in 1915. Yet you think that same logic does not apply to the other people who recommended only 74,000 in 1915, but were favorable to the larger number in 1917. You stated in answer to a question by the chairman that this 97,000 men was authorized just for the manning of the ships then in existence. Do you know whether that is correct? That was done for the purpose of making preparation to man the new ships that were also authorized in the same bill in August, 1916, as a part of the whole program, was it not?

Capt. TAUSSIG. My understanding is that it was partly for both.

The CHAIRMAN. I think that was included in my question.

Senator TRAMMELL. No; you stated the ships then in existence.

The CHAIRMAN. I think I stated both.

Senator TRAMMELL. Of course, the record will show what you asked. I did not understand it that way. That is the reason I wanted to find out about it. Now, Captain, it seems you have had a good deal of experience in connection with the personnel. Did you experience any difficulty in 1914 in enlisting the required men into the Navy?

Capt. TAUSSIG. Not in 1914; no, sir. We did previous to that.

Senator TRAMMELL. Did you in 1916?

Capt. TAUSSIG. I was not in the Bureau of Navigation in 1916, sir. I had nothing to do with it then.

Senator TRAMMELL. The reason I asked the question, Capt. Palmer said yesterday that they had some difficulty in recruiting even up to their authorized strength in 1916 and even in the early part of 1917 until the war was very imminent, and then they did not have so much trouble.

Digitized by Google

Capt. TAUSSIG. I can not state at first-hand as to that. I can only give an opinion on it.

Senator TRAMMELL. Was not that constant changing and shifting due quite a bit to the difficulty in holding people in the Navy, especially the enlisted personnel that you speak of, and that they wanted to get out when their time ran out?

Capt. TAUSSIG. We were recruited up to our full strength allowed by law in 1914. We had every man the law allowed. We had to stop recruiting for a couple of weeks, except the men who reenlisted, whom we had to take in. In 1914 we set up our recruiting stations for about two weeks except as to reenlisted men, because we were full up to what the law allowed. We could have gotten all the men that could have been needed.

Senator TRAMMELL. But you do not know as to what the conditions were in 1916, as to whether they had recruited up to the full strength or not authorized by law in 1916?

Capt. TAUSSIG. Oh, yes; they were recruited up, up to the time the authorization for the increase came in.

Senator TRAMMELL. Do you know when the naval reserve law was passed?

Capt. TAUSSIG. There were several naval reserve laws. There was a law passed first, I think, in 1914. It was while I was still in the Bureau of Navigation. I am not sure of the date when they passed the law later providing for the big reserves. I think it was August 29, 1916. It was modified several times. I can not give those dates

Senator TRAMMELL. I think I have no more questions.

The CHAIRMAN. I think that is all. You may be excused.

Capt. TAUSSIG. May I have my testimony sent to me to Newport for correction? I should like to get back to my station.

The CHAIRMAN. Very well.

TESTIMONY OF REAR ADMIRAL C. P. PLUNKETT.

(The witness was sworn by the chairman.)

The CHAIRMAN. Will you please state to the committee what your duties were which you were performing just previous to the entrance of the United States into the World War and what duties you performed during the war?

Admiral PLUNKETT. In the summer of 1915, while I was at the Naval War College, in September, Mr. Daniels sent for me to come to Washington, and on my arrival here I was acquainted with the fact that on the recommendation of Admiral Benson, commander of the fleet, I had been selected for director of gunnery exercises and engineering performances, director of target practice. As I still had three months of my work to do at the War College I wanted to finish the course there, and, further, I wanted to go to sea, although I was not due for sea. However, the gunnery situation in the Navy was pretty bad. I think Capt. Taussig's testimony pretty fully substantiates the situation at that time. I received orders which provided for my traveling back and forth between Newport and Washington until the end of the War College course, when I could take up the duties permanently, the idea being to get the run of the office as soon as possible and see what the general situation was.

Digitized by Google

So in the latter part of December, 1915, I took over the active direction of gunnery under the Chief of Naval Operations as one of his assistants.

I remained on that duty until July, 1918, when I went abroad, but the last four or five months of my tenure of office, beginning along in February, most of my time was taken up with the organization and training of the naval railway batteries which went to France in the middle of that year, so that I did not take a very active part in the gunnery training of the fleet during those last few months. Owing to the shortage of officers, no officer was sent there to relieve me, but the situation in the fleet, under the able command of Admiral Mayo, was such that nothing that I could have done would have in anyway influenced the successful progress of gunnery training, it being pretty well standardized and systematized by that time.

At the very beginning, when I took over the duties of gunnery training in the Navy Department, I went to Mr. Daniels and stated in the most positive manner that there could be no gunnery without people, and we did not have the people. To make a long story short, I argued with him, first and last, for two years, without ever making any impression upon him whatever, that we could have no successful gunnery in the American Navy until we had a sufficient personnel.

I want to say right now that in all my dealings with Mr. Daniels I have never been treated with greater courtesy by anyone, but he is the only man that I ever had anything to do with that I practically left little or no impression upon. I make that preliminary statement in order that you may understand the situation perfectly.

The CHAIRMAN. Admiral, will you state what your duties were after July, 1918?

Admiral PLUNKETT. After July, 1918, I was in France in command of the 14-inch naval battery.

The CHAIRMAN. Until the end of the war?

Admiral PLUNKETT. Until the end of the war; yes. At the end of March, 1917, when we were on the verge of entry into the war, the gunnery was at the highest state of efficiency that it has been in the history of the American Navy. In my opinion this was due to two things: First, to the commander in chief of the fleet, Admiral Mayo; second, to a full realization of the number of men that were needed in any ship of war to fight her efficiently in battle.

In 1915, when the question of shortage of personnel was most acute on the vessels which were in commission, there was a great deal of loose talk, and there were memoranda and reports and other things as to the number of men required to man a ship efficiently. As a matter of fact, we have some definite information from the people who designed the ship that the number of men that we thought we needed to fight those ships efficiently could not be berthed in the ships. They were not big enough to hold the crews that we needed to fight the guns in the ships.

Having had considerable experience as executive officer of four ships, three of them battleships, and having commanded a couple of first-line ships, and having given the best part of 15 years of my service to the question of organization, I felt that I was in a pretty fair position to estimate what a ship needed to fight her.

When Admiral Mayo became the battleship-force commander he made a report, or when he was division commander he made a report

Digitized by Google

in regard to shortages of personnel, which I think Capt. Taussig quoted. When he took over the more important command of all the battleship force he took up this matter very seriously, the question of what was the proper force aboard of a battleship in order to fight the ship efficiently.

I might say right now for the benefit of Senator Trammell that no officer in my recollection ever dreamed or ever thought of having a personnel sufficient to man everything carried on the Navy list and have it ready for battle at the outbreak of the war. All we figured on was that the ships which were turned over to us to operate, and which we called our fleet, should be fully manned and should be ready for war; that is all.

As the result of Admiral Mayo's efforts, in which I heartily concurred, we finally arrived in the course of two years at what was the correct number of men and officers in order to man our ships which were then in commission so that they would be efficient in battle. The numbers which we arrived at were far in excess of the numbers which were contemplated in the original design of the ships.

I might say as bearing directly on this and also having an influence on the number of these men, that in 1915 we woke up to the fact that we had built a number of very excellent ships, but we had not found out how to fight them. Before 1915 there was a fire-control board ordered, which went right into the question, not of using the guns of the ship one at a time but how to use all the guns at the same time so as to bring the greatest volume of fire to bear upon the enemy, and it was the report of that board that pretty nearly turned the Navy upside down, and was the first step in the direction of showing us what we actually needed in the way of officers and men on our ships in order to fight them in battle and to bring all their offensive and defensive weapons into action at the same time. Naturally the money was asked for at once, but it takes time to produce the instruments that were required to be installed in those ships, and also naturally our latest ships were the first ones to receive them.

Again, owing to the methods which were taken up under Admiral Mayo's direction, and in fact mostly by his orders, the people of the Navy had brought home to them what gunnery should be and how to arrive at those results. This board was in intimate touch with the most efficient methods for using our guns and torpedoes.

Up to 1915 we had been conducting battle exercises by opening the engagement by firing a single gun in order to get the approximate range of the enemy, followed by another gun after that shell had landed, some 20 seconds later, also with a view of getting the range, some correction being applied to that second shot; in other words, a method of approximation. The question of range finding was taken up seriously. Up to 1915 we had comparatively no efficient range-finding instruments. Those are instruments of prime importance, and at the outbreak of the war we had only a sufficient number of them for our first-line ships. The ships in reserve had practically no range finders worth mentioning.

All those things and the concentration on gunnery training brought home to us the fact that we were terribly undermanned, and it was those reports that Capt. Taussig speaks of here which flowed over my desk in volumes, which kept me pegging away at the Secretary of the Navy all the time asking for more men, and representing to him the fact that we needed those men.

Digitized by Google

Now, it may seem odd, when I was a subordinate officer, that I took those memorandums to the Secretary of the Navy; but I assure you that I took them there because the Chief of Naval Operations had exhausted all the talk he had in his system.

The CHAIRMAN. Who was the Chief of Naval Operations?

Admiral PLUNKETT. Admiral Benson. He said, "If you can get them, go and get them. I can not get them."

In 1917, shortly after I took over the direction of gunnery, the controversy arose, which you probably remember of Representative Gardner, Representative from Massachusetts, who offered resolutions in the House of Representatives, which were adopted, calling on the Secretary of the Navy for a statement as to the gunnery efficiency of the fleet. The resolutions were referred to me for answer as the data with reference to gunnery efficiency of the fleet were in my office, and therefore the answer which went to the House of Representatives, to the Speaker, and later a similar answer which went to the United States Senate in response to resolutions submitted by Mr. Lodge, was prepared by me in my office from the actual data which were there.

At that time Mr. Daniels took a very live interest in gunnery in the Navy and was very much pleased with the answers that we were able to send in, because these answers clearly showed that while we were down and had been down, we were on the up grade; that things were being rectified in gunnery, and eventually, about a year afterwards, when we had made considerably more progress, Mr. Gardner visited my office, by permission of the Secretary of the Navy, and we convinced him thoroughly that he was on the wrong tack, and that we were doing everything that was possible to build up the gunnery of the Navy.

But that applied only to the ships which were in commission, and the gunnery knowledge which was going on to the Navy at large was practically restricted to the officers who were actually on the ships in commission. Those who were on shore and other duty had not enough time to take up these matters. But never in the history of the Navy has there been anything more intensive than the gunnery training of our fleet which took place in 1916 and 1917 and 1918. The result of that was that when the war broke out, although we were still undermanned, the gunnery efficiency of the ships that were in commission was higher than it ever had been in my recollection of the Navy. As a matter of fact, we had just one battleship, the *Wyoming*, fire in practice at nearly 20,000 yards, the longest range that has ever been fired by the service, and she made the phenomenal score of 20 per cent of hits under battle conditions.

I was with the fleet in the spring of 1917, and left there about the middle of March and came back to Washington, and on my arrival here, shortly afterwards, I submitted to the Chief of Naval Operations the report of the status of gunnery operations in the fleet, in which I summarized the practices that had taken place, in a general way, in order that he might have first-hand information as to the state of affairs, just before the outbreak of the war. I did not comment in this report on the excellence of the training, but just merely stated what forms of target practice had been carried out, and made a recommendation that the training continue just as it had been; that there were no changes to make; that I was in full agreement with the

Digitized by Google

commander in chief that everything had been done in the way of laying down correct lines for gunnery training, and that, war or no war, we saw no reason for making any change in that direction. That the one thing was to insure the permanence of the personnel; that is to say, of the people who were actually in the fleet when the war broke out, in the battleships and our destroyers; to retain those people absolutely intact in order to hold our gunnery efficiency which we had reached at that time, and which, I say, was the best in the history of the American Navy.

If you remember, about that time, or shortly before it, the armed-guard duty was ordered by the President; the question of putting guns on merchant ships and assigning crews. As I said before, the only trained men we had in the Navy were the men in the fleet, because anybody who had been out of the fleet was behind the times. We were moving fast. And the first call for 400 armed guard crews in the fleet, naturally the people sent were the people who were manning guns of the type we were putting on the merchant ships, and also those who could be spared without impairing too greatly the turret efficiency of the ships; so that the first people that went were the crews which manned the secondary torpedo defense batteries of our battleships, and the officers and petty officers which went with them.

But, as a division on a battleship of secondary battery guns only has two or three officers, and as they amount to no less than 22 guns in some ships, and it only required at the outset from two to three guns on armed guard ships and three only on the liners, you can easily see that the officers capable of directing the fire of those guns were a little insufficient; and therefore we had to have more officers for this armed guard duty, and that was where the trouble began.

The CHAIRMAN. What was the date of that?

Admiral PLUNKETT. I forget now. It was continuous. It began just before our entry into the war and continued right along practically the whole of the year 1917. In fact, it ran up to 1,700 or 1,800 vessels; I do not know how many; a very large number. So that the officers who were capable of being assigned to this duty were soon exhausted. But it involved our going into our turrets and taking a turret off; for instance officers who had had anywhere from two to three years' experience; officers who were thoroughly conversant with our gunnery training methods; officers who were of the highest possible sort in regard to our gunnery training and were in sympathy with it. And that was the beginning of the downfall, you might say, of the fleet efficiency; and I have seen nothing on record to indicate that they ever fully recovered from it, not even when the armistice was signed. Of course, they were as efficient as human perseverance and the mentality of the men at the head of it could make them; but, as testified by Admiral Palmer here, in October, 1917, he had to begin a process of forcing the battleships to give up their reduced allowance of officers still further, nearly 50 per cent, and in filling up the vacancies in the battleships—the total number of officers—from officers of very little or no experience; officers, for instance, who were not in the Navy before the war at all; some of them college men, and others who were sent to Annapolis for short courses of training, and reserve officers.

Digitized by Google

In the fall of 1917, when Admiral Rodman took his ships abroad and arrived on the other side, the condition in those ships was pretty much as it was in our battleships that stayed behind. They were very much depleted of the number officers that they had in the spring of the year, when we entered the war, and had practically only a nucleus of those officers; and naturally they were not ready for battle when they got over there. The *Texas* actually had, later on, pretty nearly 75 per cent of her crew green men. She was the ship that had carried the gunnery trophy as the result of her work just previous to the war, and when she arrived on the other side had not fired a gun for six months. That was due, in her case, that she had been unfortunate enough to get ashore, and had to go to the navy yard and have her bottom repaired. But at the same time, with 75 per cent of green men on a ship, the wildest imagination would not claim that that ship was ready for battle, and I believe that is the way she was reported, on his arrival, to Admiral Rodman. The truth of the matter is that when we entered the war we were forced to take the defensive. Instead of the offensive, we took the defensive. The first move was the organization of the patrol forces of the Atlantic coast, a purely defensive measure. That force brought into being practically all the light craft we had in the Navy—destroyers, gun boats, and everything that could be converted into a scout. We had on the west coast most of our big cruisers, which had been in reserve there for some time. They had to be brought around. In fact, I think some of them started immediately before we entered the war. I do not remember exactly what the situation was. We had one, of course, which was the flagship of the destroyers, the *Seattle*. But it called into being practically all the small craft we had, of whatever type, that could be used for patrol purposes; and that, in a measure, is how some of these craft in that list that Capt. Taussig showed you here, which were of very little military value, were called into being; the idea being that in the patrol, if you saw one of these submarines, although the fellow sunk you, you gave warning to many of the other craft, and then they could start and search for him right away. It was not that these craft contained military value enough to offer a military offensive, but they were there for scouting purposes.

This force that was created, the defensive force that I speak of, was in the course of time turned into the splendid force that we had on the other side. In fact, in Admiral Sims's letter he refers particularly to this force being organized on this side for operations here, instead of being organized on the other side for operations over there.

It was not long, however, before the situation began to clear up a little bit; because I think you must realize by this time that we had no plan when we entered the war—no war plan. We had a mobilization plan, that is a plan giving the list of ships and the number of men and officers to go to them, but there was no plan for making war—using those ships for war purposes. It simply called for their mobilization. So that, as soon as we entered the war, I expect the Chief of Naval Operations was flooded with all sorts of suggestions as to how to make war on the Hun. I know that I offered such a suggestion; and likewise, I guess, a good many others did. But all our suggestions were based on a lack of information, because, when all was said and done, when we entered this war I think the majority of us thought that the war was pretty nearly over. As a matter of fact, it was at

Digitized by Google

its most critical stage. Our information was insufficient and defective. In fact, in many cases it was absolutely wrong, as we afterwards found out.

However, there was no plan for the offensive action. Whatever plans there were, or whatever plans were first evolved, were entirely defensive.

I am not aware how long that continued, as I was not in such intimate touch with the orders which went to the different force commanders as would indicate when the attitude changed; but in the absence of any plan, the most natural thing to do was to take the defensive until you find out "where you are at," and that was our situation.

To man the ships that were in the mobilization plan there, even partially, exhausted practically everything in the way of personnel that we had, and I think that Capt. Palmer and Capt. Taussig both clearly brought out what we expected to happen; in other words, that we were not surprised.

The CHAIRMAN. That you were not what?

Admiral PLUNKETT. That we were not surprised. In other words, that we expected it. I do not think there was anything in the first few days of the war that turned up that surprised us in any way whatever. I do not think that there was any reason why we should have any other mental attitude in regard to it; that it was pointing away off; that we had been a long time trying to get more men and to impress upon everybody that a navy without men was no navy; and that a ship without a proper complement was no ship. We had not had any luck, but we realized that the moment we got in the war this stuff would flow in so fast that you would not know what to do with it; and that is just what happened. Money came tumbling in! Lord! There was money to a finish. Men offered their services. We would have broken up Gen. Crowder's conscription plan if we had taken everybody that wanted to go in the Navy. When it comes to the question why we could not recruit our people in 1915 and 1916, the answer is that the era of profiteering had gotten under full headway in this country, and men could make so much money outside, and there being no prospect of a war in 1916, why should they go in the Navy? So that when war actually did come upon us, we were short-handed, and it was nothing but the natural instinct of the American that saved the day. They came in vast numbers, more than we had quarters for, more than we could handle, more than we had anything for. These people came and offered their services.

Men were willing to throw up big positions in order to come to us at a meager salary. I think that was testified to by Capt. Palmer, here. He said here that the Bureau of Construction and Repair had 70 men on their list who were willing to come with the Navy, who had salaries running from $10,000 a year up, and who were perfectly willing to come with the Navy for $3,000 a year. We met that everywhere. But that does not make a Navy. That is simply material to work with. And so fast was this thing traveling, and so fast were we expanding that in June, or in the early part of May, 1917, Mr. Daniels sent for me one day and he said, "I want you to go to Boston and New York and Philadelphia and Norfolk, and look into this reserve business." He said, "I do not want you to say a word to a living soul, but I want you to come back here and tell me what you think

Digitized by Google

about it." Mr. Chairman, I went right straight to Mr. Palmer, just as straight as I could walk, and I said, "The Secretary is getting a little doubtful about this reserve business."

The CHAIRMAN. What was the date of this?

Admiral PLUNKETT. It was in May.

The CHAIRMAN. May, 1917?

Admiral PLUNKETT. May, 1917. I said, "I do not know anything about the reserve business. I am here in Washington. I do not know what you fellows have been doing, but I know that you must be getting some pretty good people. Now, it would not be a good thing to have this thing suddenly stopped, even though you made a good many mistakes."

However, I started off, and I went to these various places and when I came back I made a report to the Secretary, saying that under no circumstances should he do anything to stop the increase in enrollments in the Naval Reserve; that we were having brought to us the best material there was in the country, and that, in time, we could mold that material into what we needed to carry on the war. And I think that proved true, for without those people we never could have carried on this war. Of course I do not know whether he took my advice or not. He probably did not. But, at all events, I tried to impress upon him as fully as possible the importance of the recruiting question, which Admiral Palmer testified. The struggle he had with him on the question of reserves continued long after that. He was afraid of getting too many people, so that he would not know what to do with them. But, considering the shortage we suffered with, and our facilities for handling these people and for taking care of them and preventing them from getting sick, etc., we wanted to take all we possibly could all the time.

Now, this change from a purely defensive attitude to an offensive attitude came about through a realization that the war was over there and not over here; through the fact that we began to understand that the British secret service was of such a high class that nothing could come to our coast and do material damage—anything which would really tend in a material way to win the war—without ample warning. I think that is fully borne out in the reports which came from time to time, in which their predictions are nothing short of phenomenal I think they must have used the ouija board or something like that.

I do not see how they ever got the information, it was so exact. But it has the effect of gradually reducing the patrol force which we had on our coast here of vessels which could be used in the anti-submarine campaign, and their replacement by other types, submarine chasers, etc. It is entirely probable that we could not have replaced these ships within one month or two months of the outbreak of the war, because we did not have the personnel, nor did we have, nor could we get without the most strenuous opposition, probably, the types of vessels which could be used for purely coastal patrol purposes. But my private opinion is that the reason we did not take quicker action on taking the offensive is the fact that we were short of personnel—skilled and trained personnel. In other words, we were making our suit to fit our cloth. I might say, in passing, that this armed-guard proposition, which was clearly beyond any foresight, although the Allies had been doing this for some time, was the cause of the breaking up of the efficient condition of what we

Digitized by Google

had in commission at the outbreak of the war, for the simple reason that when you put a military man on board of a merchant ship they want to deny him the air necessary for his sustenance. They hate to have him around. As a matter of fact, I think the putting of guns on merchant ships is very much against the wishes of the merchant people; but they did put them aboard, and in order to avoid any possible disruption or disputes, although there were a few minor ones, of course, we sent the highest type of our chief petty officers in charge of these guards, and officers, so that if any questions did arise, they would be handled in the proper manner; and I might say, in passing, that if the members of this committee have never read the reports of our armed guards, especially those written by our chief petty officers, they have missed some of the most illustrious history that has ever been written of the sea. The work that those people did is thrilling and I do not know a single, solitary case in which they failed to measure up to what was expected of them. But it raised Cain with the American Navy.

That also was a defensive move. The first solution of that was in the adoption of the convoy system, which was an offensive move. That is to say, if a submarine wanted to get a merchant ship he had to fight for it. If you remember, there was great stress laid on the arming of merchant ships, which was a purely defensive measure. I think I am correct in that, am I not?

The CHAIRMAN. Why would not the submarines have to fight to get the ships that were armed?

Admiral PLUNKETT. As Admiral Sims explained to you, they got them without their ever seeing them.

The CHAIRMAN. But they had to get them by torpedo instead of guns?

Admiral PLUNKETT. Yes; they had to get them by torpedo instead of guns.

Senator TRAMMELL. I think the admiral is correct in saying that it is to be considered a defensive measure. I think the President took the ground that we had a right to arm them, without our even being at war with Germany, and they were armed before we were at war with Germany, so that it certainly was defensive then. If it had not been, it would have been an act of war.

Admiral PLUNKETT. Yes; I think that I am right in that.

Senator TRAMMELL. Yes; it is considered so in international law. We were not at war with Germany when we first armed our merchant ships.

Admiral PLUNKETT. I have not any familiarity with international law.

Senator TRAMMELL. I am just saying that I think you are correct in stating that that was a defensive measure.

Admiral PLUNKETT. I am simply saying that it was not a measure of offense against the enemy, but it was purely a defensive measure.

The CHAIRMAN. I was just getting the point in my own mind.

Admiral PLUNKETT. So that if we continued it after we went into the war, we were still adopting a defensive measure and not an offensive measure. In other words, our trained personnel was being used for defensive purposes and not for offensive purposes. Do you get my point?

The CHAIRMAN. I get your point. I wanted it explained.

Digitized by Google

Admiral PLUNKETT. Yes. There is the parting line, as referred to in the letter of January 7 that Admiral Sims wrote, and that is the prime reason why the fleet—and when I speak of the fleet I mean the battleships—were not ready for war at the end of the war, because it takes years to train officers and men to conduct the gunnery of a modern battleship.

The question has come up here, how long we should have started ahead in order to get officers. Ten years is not a minute too soon. But whether we should have all our ships fully manned and ready for battle is a matter of policy with which we are not concerned in any way whatever. But when you attempt to keep 16 battleships in full commission, unless you keep them fully ready for war they are not worth the money you are spending on them, because everything is absent when a ship does not understand that the reason of their existence is their ability to fight and fight effectively; and a ship which is undermanned can not fight effectively, no matter what the skill of the people may be.

Now, if you noted, in the hearing Capt. Taussig says that if the destroyers which we sent over on the other side had been required to take up general fleet work—by which he means work in the defensive screen, scouting and possible action against destroyers, action against battleships and other types of ships, the general work that destroyers are capable of doing—he wanted four months to go away from the war zone to train. Now, this is the officer who, when he arrived at Queenstown and was asked how long it would take for him to get ready for business, said that he was ready. What he meant was, he was ready to go after submarines just as you find in Capt. Laning's testimony he states that in August, 1917, there is a memorandum from the Chief of Naval Operations, paragraph 4, I think it is, signed by Capt. McKean here—saying that in August the fleet will be ready for anything. He does not mean that. He does not mean that it will be ready for anything, but he means that it will be materially ready; they will have the material; they will have the guns, and will have the instruments for handling them, and all that sort of thing, because he is too good a gunnery man to mean anything else. The truth of the matter is that if we had been up against Germany at the outbreak of this war we would be paying the indemnity to-day instead of their paying it; and all because we did not have a sufficient personnel. Because, ship for ship right through the line, as we know their gunnery was, although they stood the British on their heads in the battle of Jutland, we were ready for them if we had the men. We did not have them. The reason we did not have them is because Mr. Daniels would not let us get them. He would not let us argue with the committees in Congress, would not let us do anything toward getting more men, in spite of the fact that everybody from the top clean through to the bottom knew that we must have men.

Now, whether it is a question of 71,000 or 61,000 men, they are away short of the number; and no officer of the ability of the officers who were on the general board would recommend, except under the most extraordinary pressure, a recommendation so far short of the needs of our fleet as the recommendation of 67,000 men, for what we had. I know that I never have at any time acquiesced in the view that we had sufficient personnel. I have never acquiesced in any of

Digitized by Google

the statements in any of these reports that we were ready from stem to stern; and I do not acquiesce in any report to-day that indicates in any way that our fleet is anything but a wreck of what it was.

The CHAIRMAN. A wreck now?

Admiral PLUNKETT. Right now; to-day.

The CHAIRMAN. How about when the war commenced?

Admiral PLUNKETT. I have given you a statement of what the condition was when the war commenced.

The CHAIRMAN. The same would apply, that we were not ready from stem to stern when the war commenced?

Admiral PLUNKETT. All that were ready were the ships that were actually full manned, or nearly fully manned, and in commission. Those ships, in my opinion, were ready, but those were the only ones. And by that I mean the battleships and destroyers. I do not include the submarines, because I understand there was not one of them that was ready. I do not know. That you can probably get from Admiral Grant. But I limit my statement absolutely to those two types of ships alone, which do not go to make a fleet, by long odds. They are only part of a fleet. Our scouting force we had not.

As for the auxiliaries that go with the fleet, we had just a few, enough for our peace-time purposes and no more.

The CHAIRMAN. Do you know what ships we had that were ready and in an adequate state of preparation at that time?

Admiral PLUNKETT. What ships that were?

The CHAIRMAN. Yes; other than destroyers and battleships.

Admiral PLUNKETT. Well, I could get that information if you want it. I have not got it right at hand.

The CHAIRMAN. I would like to have that information put in the record.

Admiral PLUNKETT. We had one battleship that had just come out, the *Arizona*. At the outbreak of the war she was not ready for war in any sense of the word, because she was a brand new ship. She had been in the navy yard up to December of the previous year, fitting out. She was a beautiful ship, and is to-day probably one of the most efficient ships, they say, in the fleet. But she had not conducted any firing to speak of. In fact, I do not remember just when we conducted her firings, but we fired all of those 14-inch gun ships, the *Pennsylvania*, the *Oklahoma*, the *Arizona*, and the *Nevada*, in order to find out what caused the tremendous dispersion of our guns; and we have also conducted experiments ever since then—that was, in 1916—and we are no nearer the answer to-day than we were then. One reason for it, I think, is due to the fact that when Congress practically offered us a proving ground, to cost $10,000,000, the Secretary only allowed $1,000,000. I remember going to him with the Chief of Ordnance. He said, "We have got to get this proving ground and find out why these shells are flying all over creation instead of where they are intended to go, and we must have a proving ground where we can fire the guns and then go and dig up the shell later and find out why this thing is going on." We understand that the German dispersion is very much less than ours, and the British, even, is considerably less than ours.

There is one thing sure, that one salvo goes down here, and it is beautiful, and the next one that comes down here, they are scattered all over the lot. I think you were probably shown one salvo that

Digitized by Google

the Pennsylvania fired, and that was published with big headlines on it, "Wonderful shooting of the Navy," and that was a case where one salvo that they fired had 12 shots in a very small pattern. As a matter of fact, they have not solved that thing yet. Of course, the gunnery man does not mean to cuss his tools until he is pretty sure that he has exhausted all possible errors that the personnel can make, and therefore I have never been on the side of the people who condemn things because they do not work just the way you expect them, right off the bat. In fact, I have been an advocate of analyzing everything—every shot that we fired—with the idea of getting all the information out of it that we can possibly get, so that if we make any errors, we are going to find out what they are, and so that we can take steps to avoid them. That is the only way to make improvements in gunnery, just through intensive observation and analysis.

But here was a case where we had this opportunity, and the Chief of Ordnance said, "For Heaven's sake, go and see the Secretary. We have got this thing all tied up, and they have given us $10,000,000 for a proving ground, and he will not allow us but $1,000,000." So I went down again and argued the matter with him, and he was as lovely and pleasant as usual, but he thought $1,000,000 would be enough just then, and he could get more later. We never got the "more" later. That was the time for getting it, if ever; and as a matter of fact, we are still up the stump. We do not know to-day about the dispersion, and I guess the best standard we got was the firing of this same type of gun, 14-inch 50-caliber guns, that I took over to France, where we fired at ranges very, very much in excess of what would be the battle ranges on the battleships, so that those data could not be of very great value.

But it does show that those guns are phenomenally accurate at very long ranges. Of course that is where the projectile goes up in the air 17 miles, and comes down. It is almost like going up to the moon and dropping down on the earth again. It is an entirely different problem, firing at those high angles. The angle of firing on the ships at present does not give a range much in excess of 23,000 yards, although with the later types of ships we are building, the range will be up to 30,000 yards because of the increase of elevation of the guns in operation. But, as a matter of fact, we are to-day right where we were 4 years ago on that. We have not got it solved yet.

The CHAIRMAN. You stated that the reason you could not get men to enlist in the Navy in 1916 was because the cost of living had gone up and wages and salaries had gone up, and there was no prospect of war at that time. You mean so far as the people of the country were concerned in general?

Admiral PLUNKETT. Yes.

The CHAIRMAN. Not as far as you in the Navy were concerned?

Admiral PLUNKETT. Nobody thought there was going to be any war. In 1916 the majority of the people in the country were glad they kept out of war. They were pretty well satisfied about it. I think everybody was.

The CHAIRMAN. I mean the Navy?

Admiral PLUNKETT. Yes; the Navy, too.

Digitized by Google

The CHAIRMAN. There was a feeling that we might go into war, was there not?

Admiral PLUNKETT. Well, I don't know; not if there was any way of keeping out of it. Of course, after the *Lusitania* note, a good many of us thought that there was no way of keeping out of it. We were sure we were going into it. There was no doubt about it. Of course you could not tell. You were dealing with a mighty uncertain fellow when dealing with the Hun. If you can guess four things only that they can do, they are pretty sure to do the fifth.

The CHAIRMAN. But was there a feeling that our Navy should be prepared if the war should come?

Admiral PLUNKETT. I never heard of anybody that exercised any other feeling.

The CHAIRMAN. That is all.

Admiral PLUNKETT. In other words, I think the vast majority of our people took the idea that these notes, where the President was writing to the German Government, were getting stronger and stronger all the time, and if the situation became absolutely desperate over there, there is no telling what they would do, and that eventually we would get into the war. It was no surprise when we went into the war; none at all.

The CHAIRMAN. Now, the gunnery practice of the fleet, you said, was excellent in 1916.

Admiral PLUNKETT. In 1916? No; this was in March, 1917. We had just completed some long-range practices down there off the coast of Cuba, firing at greater ranges than we ever fired at before, and I think that the average percentage of hits of the ships that fired—and there were probably 8 or 10, at least, that fired at this long range—was about 12 per cent of hits, because I remember writing to Admiral Sims, who was at the War College when I came back, telling him what we had been able to do, and that he would have to modify the game-board rules up there at the War College; that we had discovered we could hit at much longer ranges than they had allowed for in their rules for plotting the war games there in the War College, and I believed if we could keep on the way we were going and hold our people for another year, we would double our scores. I was very enthusiastic about it.

The CHAIRMAN. The statement that we were efficient——

Admiral PLUNKETT. That just only applies to those ships that were in full commission down there, and the battleships.

The CHAIRMAN. That does not mean that the personnel conditions had been improved by that time?

Admiral PLUNKETT. No, no; we still did not have the full complements in the ships. This is just the gunnery thing. Of course the only thing that was particularly encouraging about the gunnery was the fact that we had everybody with us, and the information that we had on all possible things that can enter into efficiency—gunnery efficiency—were widely circulated in the fleet, in the ships there; the officers were thoroughly conversant with what we found out by means of cable and from intensive training under Admiral Mayo, and the fact that these people were tremendously impressed by these things and were using it and doing everything that they could to bring up the gunnery of the fleet, was most encouraging.

The CHAIRMAN. But you were still short of men?

Digitized by Google

Admiral PLUNKETT. Still short of men.

The CHAIRMAN. And what you had was simply enough for the ships that were actually there?

Admiral PLUNKETT. Right there. Admiral Palmer brought that out very clearly. We entered the war with 2,300 officers, and I forget what the number of men was, but that was what we had. I had 523 men with me in a naval battery. Five hundred of those men had never seen a gun prior to the war. I had six graduates of the seaman gunnery class down there, four former warrant officers who were temporarily entered as junior lieutenants at the time. I had one national naval volunteer officer who was a lieutenant, a professor of international law at the University of Michigan—he had the fifth gun—and then there were 25 other officers that I made out of anything from seamen, second class, to chief machinist's mate. They were young men, college men, that we had on our rifle ranges around at the various naval stations; all young men of intelligence and ability, some of them of rare ability. Those people did the stunts they did, and what they did they did remarkably well—perfectly, as a matter of fact. I would not ask for better people. But that is not turning out people of the Navy. I have got them to-day down at Guantanamo. I have two of the destroyers now, on which, outside of the commanding officer of the destroyer, the rest of them are all very young people, and none of them, except in some very exceptional cases, will qualify for the ranks they now hold. But they are willing, they are intelligent, and they have got snap and push enough, they want to learn, and we are giving them the chance. They will get there after awhile. But I do not know how many of them are going to stay with us. Most of them are worried to death with their family affairs, and how they are going to make both ends meet. But they are doing remarkably well under the circumstances.

The CHAIRMAN. Have you any further questions to ask, Senator Trammell?

Senator TRAMMELL. I do not think so.

The CHAIRMAN. Senator Keyes, have you any questions?

Senator KEYES. No, sir.

The CHAIRMAN. Have you any further statement to make, Admiral Plunkett?

Admiral PLUNKETT. No, sir.

The CHAIRMAN. Then we will adjourn until Monday morning next.

(Thereupon, at 1 o'clock p. m., the subcommittee adjourned until Monday, March 29, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

MONDAY, MARCH 29, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Keyes, Pittman, and Trammell.

The CHAIRMAN. The committee will come to order. Admiral Grant, will you take the stand?

STATEMENT OF ADMIRAL A. W. GRANT, UNITED STATES NAVY.

Will you please state to the committee what duties you performed from the beginning of the World War in 1914 up to the present time, and what positions you occupied in the Navy?

Admiral GRANT. At the beginning of the World War in 1914 I was a captain in the Navy, in command of the battleship *Texas*, on the coast of Mexico, and continued in command of that vessel until June 10, 1915, when I was ordered by the department to command the submarine force of the Atlantic Fleet and to supervise all submarines in commission on the Atlantic, Pacific, and Asiatic stations.

I was promoted to the rank of rear admiral September, 1915.

This duty continued until the 20th of August, 1917, when, by orders of the department, I assumed command of battleship Force 1, United States Atlantic Fleet, with the rank of vice admiral.

This duty continued until March 31, 1919, when I was detached from duty afloat and ordered to command the navy yard at Washington.

The CHAIRMAN. Will you state to the committee what steps were taken by the Navy Department in preparing and conducting naval activities during the war, and especially in regard to the submarine and battleship situation? I would rather have you make a statement in your own language rather than to——

Admiral GRANT. To answer that question, I will have to tell you what the submarine force was—its evolution. Up to and including the year 1915, the Government owned 38 submarines afloat, which included those named, from *A–2* to the K type of boat, inclusive. I have a table here which I will give you, which you can put right into the record, showing the type of boat, the number of boats in their type, and the dates of acts authorizing their purchase.

The CHAIRMAN. The table will be inserted in the record.

Digitized by Google

(Admiral Grant here read from the table referred to, which is here printed in the record, as follows:)

Type.	Number of boats in type.	Date of act authorizing purchase.	Type.	Number of boats in type.	Date of act authorizing purchase.
A-boats	6	June 7, 1900	K-boats	4	Mar. 3, 1911
B-boats	3	Apr. 27, 1904	L-boats	7	Aug. 22, 1912
C-boat	1		M-boat	1	
C-boats	4		L-boats	4	Mar. 4, 1913
D-boats	3	June 29, 1906	AA-boat	1	June 30, 1914
G-boat	1		N-boats	7	
E-boats	2	May 13, 1908	AA-boats	2	Mar. 3, 1915
F-boats	4	Do.	O-boats	16	
G-boats	2		R-boats	27	Aug. 29, 1916
G-boat	1	Mar. 3, 1909	S-boats	21	
H-boats	3		Do.	20	Mar. 4, 1917
K-boats	4	June 24, 1910			

These vessels were bought at intervals from 1900 up until 1911. I am speaking of the first down to and including the K's there. They were not built upon designs prepared by the Government but upon designs submitted by contractors. Their tonnage, surface displacement, varied from approximately 100 tons for the A-boats to 392 tons for the K-boats.

The first seven L-boats were contracted for under the act of August, 1912.

The first four of these boats were placed in commission in 1916.

Under the act of March 4, 1913, four more L-boats were appropriated for, three of them being in commission the latter part of 1916, and these boats were of contractors' designs, generally speaking, with slight modifications made by the Bureaus of Construction and Repair and Steam Engineering.

There were two other boats, *M–1* and *AA–1*, contracted for under previous acts, which were single vessels of a type built upon contractors' plans.

Under the act of June, 1914, the department contracted for the M type of submarines, about equal in size to the *G–4*, which was built under the act of August, 1908. The ordering of this type of submarine was in my opinion a decided step backward, and during my service as submarine force commander I repeatedly expressed this opinion.

During the summer of 1915 tests were provided in the Bureau of Steam Engineering and the Bureau of Construction and Repair for officers selected for their knowledge of submarines, who were to have special charge of submarine construction and design so far as pertained to these bureaus, and also to coordinate the efforts of bureaus with respect to the building of the submarines under contract appropriated for or in contemplation. As early as 1915 I recommended the construction of submarines of approximately 800 tons surface displacement, and continued to talk upon this subject until Congress passed the act of August 29, 1916, appropriating for three 800-ton vessels.

In the initial naval acts appropriating for the N boats and the first of the 800-ton S boats, Congress appropriated for the O boats in March, 1915. The O boats were a decided improvement over anything that had preceded them, having a surface displacement of approximately 500 tons.

The R boats provided for in the act of August, 1916, were approximately 50 tons larger than the O boats. It took more than two years of propaganda to bring department officials to recognize the importance of having a submarine capable of performing equal duty with the German 800-ton U boats.

The L boats, which I have previously mentioned, were the latest type placed in commission while I had command of the force up to August, 1917, and of them or previous types I can speak knowingly of their practical use. Their design was not good as regards machinery, with especial reference to the oil cooling and lubricating system.

Four K boats, from July 1 to October 1, 1915, were sent to sea for 10 days, and then returned to the yard on account of breakdowns, for a period of three months for further overhauling due to the poorly designed engines.

The L boats were but a trifle better.

The main trouble with the engines in the K and L types of boats was, as specifically mentioned above, due to the fact that they were of the two-stroke cycle instead of four-stroke cycle engines. The act that called for the building of the R boats called for the building of three 800-ton boats. It was decided to build these three vessels upon designs as follows:

Digitized by Google

One to be upon the design of the Lake Boat Co. and the third upon the department's design. This was late in 1916. It was the first time, so far as I know, that the department undertook to provide and design completely a submarine vessel.

As regards getting the submarine force in readiness for war between 1915 and 1917, there was very little that could be done to get the submarines belonging to the United States in an efficient condition for war or for any other purposes, on account of the unreliability of poorly designed engines.

In July, 1917, I received an order from the chief of operations, via the commander in chief, for compliance, reading as follows:

NAVY DEPARTMENT,
Washington, July 2, 1917.

Operations 17-C.

From the Chief of Operations to the commander in chief Atlantic Fleet.

To the commander submarine force, Bureau of Construction and Repair, Steam Engineering, Navigation.

Subject: Submarines on Atlantic coast for service in European waters.

1. Designate to the department and prepare the 12 most suitable submarines on the Atlantic coast for service in European waters against German submarines.

2. Report fully on all work and on all arrangements necessary to fit these vessels for service, to transfer them to European waters, and to maintain them there in active and efficient service.

3. August 15 is tentatively assigned as the date when the expedition shall be in readiness to sail.

This is my reply. Do you want me to read it?

The CHAIRMAN. Yes.

Admiral GRANT. This is my reply.

SUBMARINE FORCE, ATLANTIC FLEET,
U. S. S. "CHICAGO," FLAGSHIP,
July 13, 1917.

From: Commander submarine force, U. S. Atlantic Fleet.
To: Commander in chief U. S. Atlantic Fleet.
Subject: Submarines on Atlantic coast for service in European waters.
Reference: (*a*) Department's letter to commander in chief Op-17-C dated July 2, 1917.
Inclosures: Listed in paragraph 14 of within letter.

1. The following submarines are in commission on the Atlantic coast:

Vessel.	Length.	Displacement.	Engines.	Battery installed.[1]	Oscillator.[1]	Gun.	Remarks.
	Feet.	*Tons.*					
D-1	135	288	Gas, 4-cycle	February, 1915	No	No	Used for instructional purposes, Officers' Submarine School, New London.
D-2	135	288	do	January, 1915	No	No	
D-3	135	288	do	January, 1916	No	No	
E-1	135	288	Oil, 4-cycle	August, 1916	No	No	
E-2	135	288	do		No	No	
G-1	161		Gas, 4-cycle	February, 1911	No	No	Experimental purposes; of little military value.
G-2	161		do	June, 1912	No	No	
G-3	161		Oil, 2-cycle		No	No	Do.
G-4	157	360	Gas, 4-cycle	August, 1912	No	No	
K-1	154	392	Oil, 2-cycle	July, 1917	Yes	No	
K-2	154	392	do	January, 1917	Yes	No	
K-5	154	392	do	July, 1917	Yes	No	
K-6	154	392	do	do	No	No	
L-1	167	450	do	do	Yes		3-inch gun being installed at navy yard, Philadelphia.
L-2	167	450	do	do	Yes		
L-3	167	450	do	do	Yes		
L-4	167	450	do	do	Yes		
L-9	167	450	do	September, 1916	Yes	1 3-inch	
L-10	167	450	do	April, 1916	Yes	do	
L-11	167	450	do	March, 1916	Yes	do	Detection tests off Nahant.

[1] Out of commission, navy yard, New York; will be ready as soon as better is installed.

Digitized by Google

2. It is from the above list of submarines that the 12 most suitable for service in European waters against German submarines are to be designated to the department and prepared for such service.

3. The department's order is being carried out, but it is well to consider before final action is taken the following precepts or doctrine concerning war service of submarines in distant waters:

(*a*) No gas engine submarine should be sent away from the United States.

(*b*) No two-stroke (cycle) oil engined submarine should be sent away from the United States if possible to avoid.

(*c*) No vessel not fitted with an oscillator should be sent away from the United States.

(*d*) No vessel not fitted with a gun of not less than 3-inch caliber should be sent away from the United States.

(*e*) No vessel that can not submerge (flood tanks) in less than one minute, the average for the K boats is 1 minute 48 seconds, for L boats 2 minutes 23 seconds. These averages are of best performances.

(*f*) No vessel with faulty periscopes which includes nonhousing.

(*g*) No vessel that does not carry fuel oil enough to make the trip across the Atlantic unaided, taking into consideration that each vessel while en route must trim down and submerge daily, not only for drills but possibly for offensive or defensive work.

(*h*) No vessel under 800 tons displacement.

4. The D, E and G classes have no oscillators nor guns and with the exception of the two E's and *G–3* have gas engines. These vessels may be excluded from the above list at once and consideration given only to the K and L type of submarines.

5. The 11 vessels (four K's and seven L's) are all equipped with two-stroke (cycle) oil engines which in service lack sufficient reliability to warrant their use on distant war service. The four K boats have no guns, a 3-inch gun is being installed on the *L–1*, *L–2*, *L–3*, and *L–4*, while the installation is complete on the *L–9*, *L–10*, and *L–11*.

6. The table (par. 1) shows that new batteries have been installed on all boast during 1917 except for the *L–9*, *L–10*, and *L–11*, which have batteries that were installed last year. Each one of these vessels carry four tubes and eight torpedoes.

7. Orders have been given to expedite the completion of all repairs on the *K–1*, *K–2*, *K–5*, and *K–6; L–1*, *L–2*, *L–3*, and *L–4;* and *L–9*, *L–10* by August 5 if possible in order that the crews may have 10 days for shakedown cruise to New London and daily submergence trials thereafter.

8. The department is aware that the *L–11* is equipped for and engaged in most important tests in connection with submarine-detection work off Nahant, and I have given no order concerning taking this vessel away from this duty, which would completely stop all tests, leaving the department to decide whether this shall be done or not, as sufficient time will be had after Monday, July 16, 1917, to overhaul and complete work on the *L–11*.

9. In order to make a twelfth vessel as directed in paragraph 1, reference (*a*), the *E–1* is therefore designated; attention is invited however to the fact that this vessel has neither an oscillator nor gun installed, and it is very doubtful whether these weights could be added to this vessel. The 12 vessels designated are: *E–1*, *K–1*, *K–2*, *K–5*, *K–6*, *L–1*, *L–2*, *L–3*, *L–4*, *L–9*, *L–10*, and *L–11*.

10. To transfer these vessels to European waters and maintain them there for operative and efficient service, the following plan is recommended:

FLOTILLA.

First division (tender *Bushnell*): First section—*E–1*, *K–1*, and *K–2;* second section—*K–5*, *K–6*, and *L–1*. Supply vessel *Y*.

Second division (tender *X*): First section—*L–2*, *L–3*, and *L–4;* second section—*L–9*, *L–10*, and *L–11*. Supply vessel *Z*.

X to be a vessel having quarters for 24 officers and 200 men, in addition to those for vessel's own officers and crew; to have well-equipped machine shop; to have stowage room for ammunition and torpedoes; to carry fuel and lubricating oil in stores; to carry spare parts for engines, etc., for six submarines.

Y and *Z* supply vessels: To be vessels of large stowage capacities with staterooms and space for additional officers and crew if possible.

An expedition of this nature going abroad must be self-sustaining from the day they leave the coast of the United States for a period of not less than six months, if possible and practicable.

The two tenders and two supply vessels should carry for the 12 submarines, equally divided, about 3,500 tons of fuel oil, and 700 tons of lubricating oil.

Digitized by Google

Provisions, clothing, ammunition, spares for engines, batteries, auxiliary machinery, medical stores, one gyro compass each, periscopes, stock materials, raw materials for repair work, hose and gear for refueling submarines at sea.

Stores should cover a period of six months.

Each tender and supply vessel shoud be fitted with towing gear for towing submarines at sea.

Tenders and supply vessels should be armed with a battery of not less than four 5-inch guns capable of all-around fire if possible.

Extra men for submarine service should be carried by these vessels and will man the batteries provided, while spare officers for submarine service would handle the fire control of these vessels.

11. *Oscillators.*—Tenders (*Bushnell* and *X*) should be fitted with two oscillators, skin installation with thin diaphragms to be used in connection with detector commutator device, a third oscillator for signalling purposes, keel installation should also be fitted.

Supply vessels (*Y* and *Z*) should be fitted with two oscillators, skin installation, thin diaphragm, for use with commutator detector device for listening purposes only.

12. Additional convoy, torpedo boat destroyers, if available, should accompany the expedition.

13. *Personnel.*—For the trip across the Atlantic three officers should be supplied to each submarine. The vacancies shown in the table shown below can be supplied from officers who have had submarine experience:

Submarine flotilla.

Commander: —— ——.
Aid, Flag: —— ——.
Aid, Secretary: —— ——.

First division.		Second division.	
Commander: Lieut. Lewis D. Causey. Aid: —— ——. Tender Bushnell: Commander, Lieut. W. L. Friedell.		Commander: —— ——. Aid: —— ——. Tender X: Commander, —— ——.	
First section.	Second section.	First section.	Second section.
E-1. 1. Ensign V. A. Clarke. 2. Ensign D. F. ——. 3. —— ——.	K-5. 1. Lieut. J. R. Lorrison. 2. Lieut. (J. G.) T. C. Berrien. 3. —— ——.	D-2. 1. Lieut. (J. G.) E. E. Logan. 2. Lieut. (J. G.) P. C. Ransom. 3. —— ——.	L-9. 1. Lieut. (J. G.) P. T. Wright. 2. Lieut. (J. G.) R. R. Thompson. 3. —— ——.

Lieut. (J. G.) K. R. R. Wallace. 3. —— ——.	L-11. 1. Lieut. (J. G.) A. C. Bennet. 2. Lieut. (J. G.) F. J. Cunneen. 3. —— ——.
Supply vessel Y: Commander, —— ——.		Supply vessel Z: Commander, —— ——.	

14. *Tactics.*—There are inclosed:

(*a*) Instructions to submarine force concerning "formations for cruising" when the force consisted of three divisions, each division of one tender and three or four submarines. As these instructions are very flexible one tender or supply vessel and a section of three submarines could form a group.

(*b*) Special signals for submarines, file 2642-P, March 31, 1917.

(*c*) Watch plans, file 2642-88-F, March 30, 1917, governs watches to be stood by tenders and supply vessels.

Digitized by Google

(*d*) Instructions regarding torpedo defense, etc., file 2710–S, dated April 8, 1917.
(*e*) List of spare parts, oil engines (blanks only). Date to be furnished by commander submarine force and Bureau of Steam Engineering.

15. Considering the facts concerning the 12 designated boats, principally:
(*a*) Unreliability of engines.
(*b*) All have fixed periscopes.
(*c*) Five of the 12 do not carry guns.
(*d*) *E–1* has no oscillator.
(*e*) Lack of habitability and radius of action. I am of opinion that should the expedition arrive safely in European waters, the majority of the vessels would be laid up continually for repairs, as all of them have been except the *E–1* since being placed in commission.

Further, that the first contingent of United States submarines that should be considered for duty abroad are the eight O class of boats building at Quincy (*O–3* to *O–10*, inclusive).

16. These vessels (O boats) have the following characteristics:
Length, 172 feet; displacement, surface, 520 tons; oscillators, yes; guns, one 3-inch, 30 rounds; torpedo tubes, 4; torpedoes, 8; engines, 4-cycle oil E. B.; batteries, Gould W. L. L., 29 Plante Peate; motors, electrodynamic; normal fuel-oil supply, 10,126 gallons; maximum fuel-oil supply, 20,586 gallons; lubricating oil, 1,185 gallons; fresh water, 900 gallons; estimated radius at 11 knots, 3,000 miles; maximum radius at 11 knots, 6,000 miles.

These eight boats are on the building ways at Quincy and I was informed by the president of the Fore River Shipbuilding Co., Joseph W. Powell, that the *O–3* would be launched August 15, and have her trials six weeks later—that the remaining boats will follow at intervals of a week or 10 days.

17. These O boats have some size and their four-cycle engines, all of the same type, should prove immeasurably superior to the two-cycle engines of the K and L classes. The spare parts necessary would be interchangeable and greatly reduced in amount as compared with spares for *E–1*, *E–1*, and *E–2*, five different designs; *K–5* and *K–6* of engines; *L–1*, *L–2*, *L–3*, *L–4*, *L–9*, *L–10*, *L–11*.

These vessels may do the work required but the K's and L's never. Even these O boats would be no match for a German 800-ton vessel on the surface.

18. If the department decides to send the 12 above-mentioned boats to European waters, sailing August 15 or at a later date, I would recommend:
(1) That the tender *X* and supply vessels *Y* and *Z* be sent immediately to the navy yard, Philadelphia, to fit out and receive stores.
(2) That a paymaster with submarine experience be sent to the *Bushnell* and one to tender *X*.
(3) That urgent orders be issued to commandant, navy yard, Philadelphia, regarding the fitting out of these vessels.
(4) That urgent orders be issued to commandant, navy yard, Boston, Mass., to complete all work, repairs, and overhaul to *L–9*, *L–10*, and *L–11*.
(5) That urgent order be issued to commandant, navy yard, New York, relative to repairs and overhaul of *E–1* and *K–1*.
(6) That urgent orders be issued to commandant, navy yard, Philadelphia, relative to repair and overhaul of *K–2*, *K–5*, *K–6*, *L–1*, *L–2*, *L–3*, and *L–4*.
(7) That all vessels, submarines, rendezvous at New London for 10 days' drill before date fixed for departure.

19. Attention is invited to the fact that the tenders accompanying these submarines are not provided with facilities for charging and boosting batteries, for charging air banks, or for providing pure distilled battery water, except the *Bushnell*. The above-mentioned facilities should either be provided on the tenders prior to their departure or such facilities be provided at a base abroad.

20. Also, all experimental work with submarine *L–11* at Nahant must cease at once.

A. W. GRANT.

The reliability of the submarines sent abroad may be understood better by reading the reports of commanders of flotillas upon their arrival abroad. I have not got them. You will have to get those from the department.

The CHAIRMAN. Can you get them for the committee so that we can have them put into the record?

Admiral GRANT. I have not a solitary thing except from my own memory. These are papers that I happen to have. I have nothing from the department. That is, I have not all the reports. I happen

Digitized by Google

to have one, Capt. Hart's report. He took the first five of those abroad, but there are other reports, which detail the troubles that they had in getting across, especially with reference to a gale they got into east of the Bermudas. One of them returned to Boston, one or more to Bermuda, and one or more of them arrived under their own power in the Azores. I have not the details, and do not know anything about that.

The CHAIRMAN. If you think it is important to put those reports in the record, please get them for us.

Admiral GRANT. They show the efficiency of the boats that were sent there, yes.

The CHAIRMAN. If you will indicate the numbers of the reports, we can get them from the department. You can get that later on.

Admiral GRANT. I will read this letter from Capt. Hart, dated U. S. S. *Bushnell*, tender, November 6, 1917:

[Confidential.]

U. S. S. "BUSHNELL," TENDER,
November 6, 1917.

From: Commander, Submarine Flotilla Two.
To: Commander, Submarine Force.
Subject: Recent voyage of the U. S. S. *Bushnell*, convoying U. S. S. *K-1*, *K-2*, *K-5*, and *K-6*.
Reference: (*a*) Force Commander's letter No. 5484, of October 21, 1917.

1. In accordance with reference, the following report is submitted:

2. The U. S. S. *Bushnell* left Philadelphia Navy Yard, convoying U. S. S. *K-2*, *K-5*, and *K-6*, October 7, 1917, 6 a. m. The *K-5* had reported ready but was unable to run either engine and had to be taken in tow within 3 miles. All three had been very hurried in their preparations for sea because of the considerable delays in completion of navy yard work. *K-2* and *K-6* ran to New London, Conn., satisfactorily on both engines, while *Bushnell* towed *K-5* the entire distance; smooth seas; speed 11.

3. Arrived New London, October 8, p. m. Submarine completing preparations for sea and doing some training submerged. All were overweight, when full of fuel and oil, even when stripped of some equipment; took out deck anchors and chains, torpedo davits, distillers, miscellaneous small weights, and four torpedoes out of *K-2*. *Bushnell* finished loading all K-class spares available; had their spare crankshafts, main motor armatures, spare cells, etc.; was full to capacity of fuel, oil, water, provisions, fresh and dry supplies, and had the submarine compartment, torpedo and war-head staterooms full of K-class spares and equipment, and extra dry provisions had mean draft of 15 feet 10 inches; her complement of boats was short by two 34-foot motor boats.

4. On October 9, 8 p. m., *K-1* joined—from New York Navy Yard. This submarine had enjoyed a most "thorough engine overhaul" at New York Navy Yard, had new circulating water pumps attached to main engines, had her engines completely assembled about 10 days before leaving the yard and was expected to be the most reliable one of the four. She proved the least reliable. On October 10, 1917, Lieut. Commander McWhorter relieved Lieut. Commander Morrison of command of *K-5;* during the long leg of the voyage *K-5* became second in reliability.

5. *Bushnell*, *K-1*, *K-2*, *K-5*, and *K-6* got underway from New London, October 12, 7 a. m., having been delayed four hours by fog. *Bushnell* towing *K-5*, speed 11. Proceeded to Cape Cod Canal, cast off two and passed through, submarines following; moderate southeast gale. *K-1* arrived east end of canal with both engines temporarily disabled. Sent *K-2*, *K-5*, and *K-6* to Provincetown and *Bushnell* towed *K-1* to the same port, where reported to and joined the Commander Submarine Force, in *Chicago*, 10 p. m. *K-1* effected repairs during night.

6. On October 13, 10.30 a. m., got underway with *Bushnell*, *K-1*, *K-2*, *K-5*, and *K-6*, in company with *Chicago*—latter towing *K-1* and *K-2*, the *Bushnell* towing *K-5* and *K-6*. Proceeded to Halifax; smooth seas entire distance, speed about 8; arrived off Halifax, cast off tows and entered harbor, *Bushnell* and submarines mooring at Imperial Oil Co.'s Wharf, October 15, 9 a. m. *Bushnell* escaped a serious accident while mooring by dropping an anchor when engine-room force failed to obey a signal to go astern. Filled submarine to capacity of water, gas, engine, and lubri-

Digitized by Google

cating oil, and provisioned them for 10 days—with additional emergency supply. *Bushnell* refilled with fuel oil and water.

7. On October 16, 6.30 a. m., got underway with *Bushnell*, *K–1*, *K–2*, *K–5*, and *K–6*, in company with *Chicago;* latter took *K–1* and *K–2* in tow. *Bushnell* took *K–5* and *K–6* in tow. Proceeded toward final destination, on great circle course; fresh west wind, rough, choppy sea, speed about 8. At 12.45 p. m., shackle bolt between towing engine wire and hawser broke, or worked out, and left *K–5* with 120 fathoms 10-inch hawser hanging from bow, by her towing pennant. Had *K–6* slip her towline and after three hours work succeeded in recovering hawser from *K–5;* while maneuvering she cut or chafed it very nearly off and 15 fathoms was discarded. Too rough to get towing pennants back on and make up tow; proceeded ahead of *Chicago*, she being unable to make the submarines one-engine speed about 8½.

8. Strong west to southwest breeze until October 19, 1 a. m., with rough sea. *Chicago* then about 65 miles astern; hove to until daylight, then laid on oil slick and got *K–5* and *K–6* in tow again. They had run about 485 miles and were in good condition, except that *K–5* was beginning to consume too much lubricating oil. Rejoined *Chicago*, *K–1*, and *K–2* at 9 a. m. (Oct. 19) and proceeded toward destination, via great circle course, both ships towing two submarines as before; calm, moderate northwest swell; towing easily, speed about 8.

9. Until October 22, 9 a. m., towed as before, calm weather, sea smooth or with long, low swell, speed 8 knots plus; *Chicago's* boat had communicated, October 21, p. m., with *Bushnell* and all submarines and took mail and two passengers. *Chicago* cast off tows October 22. 9 to 10 a. m., directed them to report to flotilla, commander in *Bushnell*, cleared ship and headed westward at about 11 a. m. *Bushnell* proceeded towing *K–5* and *K–6* and attempting to make the one-engine speed of *K–1* and *K–2*, then running broad on each bow, 2,000 yards. East wind and sea getting up; decided not to make over 94 revolutions per minute with *Bushnell*—10 revolutions per minute less than had tested the gear at. Using one 10-inch and one 9-inch hawser—one on towing engine, one on 20 fathoms wire railed on; apparently towing easily.

10. From time of *Chicago's* parting company until midnight, October 22: At 1 p. m., *K–2* experienced scaventer-receiver explosion which disabled port engine for three days. At 3 p. m. towing pennant of *K–6* carried away at link of pelican hook; she had been on the towing engine with long scope of wire out—assume cause to be defective metal. This was not a serious mishap, as it would probably have been necessary to cast her off early in the ensuing bad weather and she was in condition to run the remaining distance, as she did. Shifted *K–5's* hawser to the towing engine and went ahead at about 80 revolutions per minute. At 5 p. m. *K–1* began stopping, which continued more or less frequently during the night; she reported "minor casualties" occurring on both engines. At 6.30 p. m. *K–5* broke adrift, pelican hook accidently tripping. This was a serious mishap, since it later became necessary to tow here in good weather through more dangerous water. Proceeded with all the submarines normally on the *Bushnell's* bows, but usually scattered on account of stopping for *K–1* and the rough sea. Running with dimmed side and stern lights; very rough, submarines closed except induction ventilator; making 5 to 6 knots while running; wind one point on port bow.

11. From October 22, midnight to October 23, midnight, same weather conditions, but the sea rougher; wind force 6 to 7 and increasing somewhat. *K–1* running somewhat more continuously, after stopping from 4 a. m. to 7.30 a. m., but *K–2* beginning to stop for considerable periods. Making 5 to 6 knots while running, drifting windward 1 to 2 knots while stopped. While running, *Bushnell* pounding heavily. Submarines most under water; *K–6* able to keep an officer on the platform at top of periscope—all others handling from conning tower by what they could see from eye ports.

12. From October 23, midnight, to October 24, midnight, at first wind and sea increased with wind force 7, or more in the gusts; then began moderating and hauling seaward. But became somewhat thick and during a long stop for *K–1* and *K–2*; submarines became scattered and not all in sight at daylight. Made an oil slick and got *K–2* in tow. At 9 a. m., by which time others assembled, proceeded fairly steadily, weather condiderably better, *K–1*, *K–5*, and *K–6* on one engine. *Bushnell* towing *K–2* until 3 p. m., when her pelican hook accidently tripped. Then proceeded as before with all running and slowing only occasionally for *K–1* and *K–2*; making good 6 to 7 knots while running.

13. From October 24, midnight, to October 25, midnight, wind died out and remained clam for remainder of the voyage. Sea soon became smooth. Became cloudy and rainy, no position fix for 50 hours before making landfall. At 7 a. m. stopped and sent boat with provisions to all submarines; division commander went in *K–1*. Took *K–2* in two and proceeded as before; *K–1*, *K–5* and *K–6* running on one engine ahead and on bows; speed 8½. At noon division commander reported *K–1* to be

Digitized by Google

almost entirely disabled. *K-2* reported starboard engine ready and that repairs to port engine were nearly completed. At 1.30 p. m. cast off *K-2* and picked up *K-1*; division commander shifted at *K-2*. Proceeded as before, running steadily.

14. From October 25, mid. to October 26, mid., proceeded as before, running steadily until 10 a. m., then took *K-5* in tow, lubricating oil nearly expended. Continued towing *K-1* and *K-5*, speed about 8, *K-2* and *K-6* zigzagging on bows, running one engine. Made excellent landfall at 7.30 p. m.

15. Continued to destination as above and moored *Bushnell* in the harbor October 27, 6 p. m. Submarines moored alongside, in condition as follows:

U. S. S. *K-6*. Entirely ready for service, having run fartherest of all of them—about 1,300 miles, much of it in bad weather. She was at no time a source of worry or delay and contributed to the *Bushnell's* protection by her continued patrol on the bows.

U. S. S. *K-5*. Ready to run but consuming lubricating oil at an excessive rate, probably through leaky piston head gaskets. Had run through all the bad weather, made about 1,000 miles, mostly on starboard engine. (Port engine is evidently all right with its starboard crank-shaft, however.

U. S. S. *K-2*. Arrived ready for service, having effected repairs but considered less reliable than *K-5* Had run about 675 miles.

U. S. S. *K-1*. Arrived with both engines entirely disabled, having run about 550 miles. Several cracked working cylinders and pistons, one cracked scavenger-cylinder, cracked exhaust header, all scavenger valves badly burned and numerous minor defects. Examination had been only partial and estimated time to effect repairs was 15 days, material and spares were available. The probable cause of most of the trouble—generally burning up—was the increased back pressure caused by the muffler installed at the New York Navy Yard.

16. The flotilla commander's only previous experience with submarines was with the four sister ships in Hawaiian waters. Their engine reliability is such that they all could have probably run the last leg of this voyage within 8 days and have arrived in far better average condition than did the *K-1*, *K-2*, *K-5*, and *K-6*. Materially, the difference is that the *K-3*, *K-4*, *K-7*, and *K-8* are about as they were completed, with only minor changes made by their own personnel to effect small improvements, which were first properly developed. Of all the alterations made in *K-1*, *K-2*, *K-5*, and *K-6*, some are improvements but some are quite the reverse, and the effect has been to make them less war-worthy than are the other four. The funds expended in alterations appear to have been a little worse than wasted. However, *K-1*, *K-2*, *K-5*, and *K-6*, are, in material, quite capable of the duty they are now stationed to perform. Their personnel, now being upon their own resources and knowing they must do the work with the tools they have, will improve in efficiency. Good service may be expected of them.

17. Upon arrival, cabled the commander, United States Naval Forces in European waters of the fact and that three submarines were ready for service. Found commander, United States Navy, in port whose orders placing him in charge of our activities in those waters. Director Commander Division Four to report to him and submit a campaign order as soon as in touch with the situation.

18. On October 28, 4 a. m., began unloading *Bushnell*, using the lighters and storehouse provided; completed discharging at 9.30 p. m., and *Bushnell* sailed for Philadelphia, Pa., at 10 p. m. (October 28), via southern route. Landed all of Fourth Division spares and equipment, a considerable amount of supplies and approximately 5-months supply of dry provisions for 400 men. Filled the submarine with water, fuel, and lubricating oil and left 1,250 gallons lubricating oil in gasoline drums obtained from a naval collier; no supply of fuel and oil had arrived.

19. The submarines will moor to a sea wall on the inner face of the breakwater. They have plenty of room on the wall and breakwater and will use arches in its barracks, ready storerooms, etc. These arches each have a concrete floor about 20 by 25 feet and are closed at one end; as soon as boarded up at the other they will be quite suitable. The storehouse is across the harbor, in the city, and is not a particularly good one.

The submarines intend to install themselves on the breakwater, build galley, etc., and become as independent of tender as practicable. They will be about two weeks in settling, tuning up machinery and exercising, and in the meantime will probably not go far from port in the absence of information concerning enemy submarine movements.

20. Relations with local officials may not be at all times satisfactory. As far as known those officials are not wrongly disposed but appear closely tied down by their Government. Perhaps the fact that there is quite a local element which openly desires annexation to the United States may influence the situation.

21. The last information concerning enemy submarine movements was of one of their new ones, carrying 6-inch guns, which operated from vicinity of Madeira

Digitized by Google

northward, during first half of October; she evidently passed about 200 miles east. It is considered that the first thing to be apprehended is enemy submarines attacking shipping in that harbor. The only reason they have not already made such attack must be their fear of mines. But there are none and the enemy may ascertain that, or a submarine that has run its course and can't get home might take that way of finishing his course mines or no mines.

As the *Bushnell* found the harbor, there were several ships into which a submarine could run torpedoes from outside the harbor entrance or could even enter on a dark night without much chance of detection. Any submarine could easily sink several ships there at most any time, which would also ruin the harbor until they were raised. The local officials are making a net; it is about 8-inch mesh but made of weak fence wire; a torpedo would go through it as if it were paper.

If allied shipping is to make a considerable use of that harbor under our management it is emphatically recommended that we supply a strong torpedo net or nets, the required length is relatively very short. There are lighters available for the net gate; there will be required in addition to net, with its buoys and anchors, two hand wrenches for opening and closing the gate. It will probably be more satisfactory, if the Government concerned will authorize it, for our forces to plant, maintain, and operate the net. Pending the installation of a net and while the harbor contains much shipping, I have given our S. O. P. in those waters my own opinion that our submarine's best field of operations is off the harbor entrance; at least until there is information of enemy activity elsewhere in the vicinity.

22. *Bushnell* arrived at Philadelphia Navy Yard November 7, noon; returned via southern route. This route 350 miles farther than great circle course was chosen to avoid northwest winds and get better weather for carrying out ship drills. Encountered considerable wind, all forward of beam. Held ship drills and semiannual battle inspection. Fuel consumption was a little greater than the rather scant data on board indicated would be the case; economical speed is not yet known. Uneventful voyage returning; sighted several merchantmen, including three tramp-steamers in company.

THOS. C. HART.

Admiral GRANT. Of course during the period 1915 to 1917, there was a lot of correspondence entered into upon the subjects herein mentioned, such as organization of the submarine flotillas, location of submarine bases on our coast, requirements of a standard shore base, methods of inspecting submarines, submarine training, submarine mobilization, and various other related subjects.

The CHAIRMAN. What was the date of the trip you have just described?

Admiral GRANT. The date of this letter is November 6, 1917. I think you asked me something about plans in your previous question.

The CHAIRMAN. About what?

Admiral GRANT. Plans for war or something of that sort.

The CHAIRMAN. I asked you about the battleship situation, and the general activities of the department with regard to this subject.

Admiral GRANT. I do not recall ever having received a plan from the Navy Department looking to the use of available submarines in this war. I did, however, plan to operate them from bases upon this coast. My particular efforts after taking command of the submarines in 1915 were devoted to getting the submarines afloat into operating conditions, and more particularly to getting submarines of proper size and dimensions appropriated for. I was confident in my own belief that the war would continue for some time, and that we could within a reasonable period of time, 18 months, supply ourselves with submarine vessels of suitable dimensions and capabilities to meet all of our needs.

As Congress had appropriated in March, 1915 for 16 O boats and 2 seagoing submarines, which made 3 of the AA type, I found it very hard to get much real assistance so far as winning advocates for a larger and more efficient size type of boats was concerned. The main opposition came from members of the General Board.

Digitized by Google

In February, 1916, I was called before the House Naval Committee to make a statement concerning submarines, and everything that I said there may be found on pages 1553 to 1678 of the report of the hearings before the Committee on Naval Affairs, House of Representatives.

The CHAIRMAN. Can you give us a general idea of what you submitted to the committee at that time?

Admiral GRANT. Yes. It was from the members of this committee, the House Naval Committee, that I received the first encouragement toward obtaining a submarine of not less than 800-tons surface displacement, except, of course, from those officers who were actually serving on submarines afloat.

I was in constant touch with the Chief of Operations and the chiefs of bureaus concerning both personnel and material, and all were equally aware of the condition of the submarine force.

The service was practically new, not only to the department, so far as operation was concerned—I refer to the operation of the boats—but to nealy 100 per cent of the officers and enlisted personnel in the service.

As a submarine is a highly technical instrument, it became necessary to educate officers and men to meet the expansion of material appropriated for in March, 1916.

This led to the establishment of a base and submarine school for enlisted men and officers at New London, Conn., and the location of outlying stations at other points upon the Atlantic coast.

In these remarks I have briefly set forth the submarine situation in our Navy at the beginning of the World War. As I have previously stated, the only vessels we had in commission up to as late as 1916 were boats of the K type. The first of the L boats came in that year. We did not have a submarine of the proper type and dimensions or the personnel trained for entering the World War, in my opinion; all of which was largely due to want of education.

Senator KEYES. In order that I may understand your last statement—I am not sure I clearly understood you—let me ask you a question. Had we any submarines in April, 1917, when we entered the war, that, in your opinion, were ready and suitable to meet the conditions of the war?

Admiral GRANT. We had not.

Senator KEYES. We had none?

Admiral GRANT. We had none suitable for entering the war.

The CHAIRMAN. And when did you first begin to make recommendations for these larger boats?

Admiral GRANT. In 1915.

The CHAIRMAN. And you kept recommending from time to time to the department that they build larger boats?

Admiral GRANT. Yes; I talked to everybody that had anything to do with it, members of the General Board, and every member of the House Naval Committee, and members of the Bureau of Construction and of the Bureau of Steam Engineering, and officers in Operations.

The CHAIRMAN. Did you receive any support from the department?

Admiral GRANT. No; I did not.

Senator PITTMAN. Did you receive any report from anywhere?

Admiral GRANT. Any report?

Digitized by Google

Senator PITTMAN. Any support, from anywhere?

Admiral GRANT. From the House Naval Committee.

Senator PITTMAN. That is all.

Admiral GRANT. One officer in the General Board assisted me. I can not recall anyone else in Washington.

Coming to the battleship force, I assumed command on August 20, 1917, shortly after the reorganization of the fleet. This force consisted of 17 battleships assigned to four divisions, as follows:

Fourth Division: *Minnesota, Louisiana, Kansas, New Hampshire; Minnesota*, flagship.

Third Division: *Virginia, Rhode Island, Georgia, New Jersey, Nebraska.*

Second Division: *Missouri, Maine, Ohio, Wisconsin.*

First Division: *Alabama, Illinois, Kentucky, Kearsarge.*

We have no records to refer to, but as near as I can recall, on August 3, 1917, there were two or three of these vessels that had not joined the force. The fleet had been recently reorganized and most of the vessels forming battleship force one were placed in full commission from having been in reserve. These missing vessels had not reported for duty from the navy yards. The material condition of these vessels was not good. This subject will be referred to later.

I am unable to quote the department's order concerning the primary and secondary missions of battleship force 1. My impression now is that in August, 1917, the primary mission of battleship force 1 was to prepare for and maintain itself in a state of readiness for war and the secondary mission was the training of personnel. This policy was later changed so that the primary mission of battleship force 1 became the training of personnel, with the ultimate mission to fit itself for battle. Although sadly in need of urgent repairs, none of these vessels were permitted during 1917 and the winter of 1917–18 to visit a navy yard for a longer period than 10 days, during which time they were supposed to dock, have their bottoms cleaned, check sights, have performed other urgent work, and were expected to effect repairs upon all material requiring it. In the majority of cases letters and correspondence concerning the numerous items of repairs for any of these vessels had either not been acted upon or were awaiting the arrival of the vessel at the yard for an inspection, examination, planning and estimates, approval, and orders for the execution of the work. Obviously nothing was accomplished at the navy yards toward the upkeep of the vessels in question beyond the routine docking work.

The commander in chief wrote the following order, file 3719, dated December 3, 1917, concerning the Atlantic Fleet in home waters:

File 3719.

UNITED STATES ATLANTIC FLEET,
U. S. S. "PENNSYLVANIA," FLAGSHIP,
December 3, 1917.

From: Commander in chief.
To: Atlantic Fleet in home waters.
Subject: Readiness for distant service.
Reference: (*a*) Fleet regulations, article 4.

1. Under present conditions it is possible that any unit of the fleet now operating in home waters may be called upon for distant service without previous warning.

2. Commander in chief desires that all units of the fleet shall be maintained at all times in such condition that it will be practicable to proceed on distant service at any time after filling up with fuel.

Digitized by Google

3. To avoid unnecessary hardship, officers and men should so arrange their private affairs that no warning will be necessary in case of orders to distant service.

4. Whenever units of the fleet proceed to sea, commanders of units shall ask themselves the following question:

"Is the unit under my command in such a condition of readiness that if orders are received to proceed on distant service no further communication with the United States will be necessary?"

5. Commanders of all United States vessels shall take the initiative in carrying out the above-stated policy.

H. T. MAYO.

On February 25, 1918, file 13, the commander in chief addressed the Atlantic Fleet in home waters concerning the Navy Department's policy concerning repairs:

File 13.

UNITED STATES ATLANTIC FLEET,
U. S. S. "PENNSYLVANIA," FLAGSHIP,
February 25, 1918.

From: Commander in chief.
To: Atlantic Fleet in home waters.
Subject: Navy Department's policy concerning repairs.
References: (*a*) Navy Department's letter No. Mat-T-M1 20778-246, of February 12, 1918, to C. in C. (*b*) C. in C.'s letter to Atlantic Fleet in home waters, file 3719, of December 3, 1917.

1. For the information and guidance of the fleet, there is quoted below reference (*a*), outlining the policy of the department with regard to repairs to ships.

"Subject: *Rhode Island.* Request for repairs and inspection report.

"References: (*a*) Letter of commander Division 3, battleship force 1, to commander battleship force 1, file No. 69, January 27, 1918. (*b*) Letter of commander battleship force 1, to C. in C., file No. 812-33, January 28, 1918, and end. (*c*) Letter from commander Division 3, battleship force 1 to commander battleship force 1, file No. 69, January 27, 1918. (*d*) Letter from commander battleship force 1 to C. in C., file No. 812-33, January 28, 1918. (*e*) Letter from C. in C. to C. N. O., file 426, January 29, 1918. (*f*) Letter from C. in C. to Sec. Nav., file 426, January 21, 1918.

"(*i*) From the statements contained in the letters of commanders, battleship force 1 and Division 3, it appears that there is not a proper realization of the importance of the material inspection. As carried out, it would appear to be a very superficial inspection which gives no real information as to the ship's condition. In the letter of the division commander it is stated:

"'12. NOTE.—In regard to all items which would call for detailed examinations, it is evident that these could be covered in the admiral's inspections in most cases only by getting the opinions of the ship's personnel.'

"If this is taken to mean that such source of information is disregarded, the department can not understand the disregard of a source which would give the best information obtainable. The department depends on these reports for information as to the material readiness of ships for any service, and reports which cover her readiness for some less exacting service on a standard prescribed by the force commanders and of which the department knows nothing are of absolutely no value.

"2. The department does not consider that lack of knowledge of its policy in the use of these ships warrants any doubt as to what should be the ship's condition. The policy of the ship and force commanders should be to keep the ship in readiness for any service, and this should be the standard on which material reports are founded. With any lower standard the department is not in position to use ships to carry on the task they are called on to perform by its policy. This tendency to lay faults to lack of information of the department's policy is manifest throughout and can not in any way be accepted as reason for misleading reports.

"3. From the letter of commander, battleship force 1, it would appear that too much dependence was placed on 'standard fixed by various yards' as to what repairs were necessary. The yards are not to fix such standards. The ship's personnel are, or should be, more familiar with the needs of the ship and their standards should govern. Lack of definite knowledge as to conditions forces the yards to set standards, but the ship should know whether or not a cylinder needs boring without going to a yard and having a yard workman caliper it for them. The department holds the ship, not the yard, responsible for her material condition, and when differences arise as to the necessity for certain work the department will make the decision on hearing both sides, but

Digitized by Google

the ship must present better information than they would appear to possess, if the spirit of the letters referred to indicate what they are now expected to have.

"4. The *Rhode Island* was sent to the navy yard, Boston, October 3, 1916, for repairs and remained there until March 6, 1917, a period of 154 days, and it is evident that she left the yard in a poor state of repair, as the deteriorated condition revealed by request for repairs can hardly be due to her 11 months' service.

"5. The department did away with the 'overhaul period' as it considered a considerable amount of unnecessary time was being taken at the yard, that the tendency was for ships to let repairs go, pending arrival at the yard, and not fully utilize the ship's facilities for upkeep. The department did not intend to keep ships away from yard when in need of repairs and can not understand how its policy can be considered a reason for ships not reporting their actual material condition. It only insists that every possible effort be made to keep ships away from the yard and on work being confined to that necessary for military efficiency. The department realizes its responsibility in the matter of sending ships to yard for repairs, but must insist on the ship and fleet responsibility in keeping the department fully informed, in having itself accurate information of conditions, in eliminating all work except for military efficiency, and in making every effort to doing work with fleet facilities.

"JOSEPHUS DANIELS."

2. It is desired to emphasize the importance of keeping proper officials informed of the need for repairs, through channels provided for that purpose by the Navy and Fleet Regulations, i. e., "Quarterly report of material readiness for active war service," "Availability reports," "Reports of necessary work beyond the capacity of the ship's force," "Requests for repairs," etc.

3. It is also desired to emphasize the importance of the ship's forces, carrying out their own repairs wherever possible.

H. T. MAYO.

I read that letter because it has reference to repairs on the *Rhode Island* and calls attention to the fact that she was 154 days in the navy yard, until some time in 1917, and yet was completely out of repair.

Her sister ship, the *New Jersey*, was in exactly the same condition. In fact, most of the vessels of the division were.

A board of investigation was held in connection with the *New Jersey* which lasted a period of two or three months. I have not a copy of the report of that board—only from memory.

During the time from August, 1917, until the spring of 1918, I repeatedly tried to get these ships to the yard here to effect certain repairs, before the 10-day limit was the order.

In April, 1918, the 10-day schedule for docking and repairing of vessels of battleship force 1 at the navy yards had been completed so far as those vessels are concerned; but as little or no work had been accomplished upon the ships in question, the commander of battleship force 1 addressed the following letter to the commander in chief [reading]:

UNITED STATES ATLANTIC FLEET,
BATTLESHIP FORCE 1,
U. S. S. "MINNESOTA," FLAGSHIP,
April 18, 1918.

From: Commander battleship force 1.
To: Commander in chief.
Subject: Preparing ships for distant service.
References: (*a*) C. in C., file 3719, dated December 3, 1917. (*b*) Opnav 1st ind. 20392-748, dated November 7, 1917. (*c*) C. B. F. 1, let. 2690-153 of April 17, 1918.
Inclosure: Copy of reference (*c*).

1. In compliance with reference (*a*) ships of this force have submitted lists of repairs and alterations which would be necessary to fit them for distant service.

2. In many cases these alterations though not very extensive will require approximately 30 days at a navy yard to properly complete them.

Digitized by Google

I may enter here, which is not in the letter, that these alterations were the removal of certain intermediate batteries, for their own military efficiency, contained in the repair. [Continuing reading:]

The last docking schedule was arranged on the basis of 10 working days and in consequence important major items of work have not been accomplished, as there was not sufficient time available to warrant the yard's undertaking the work and ships of this force have left the yards with work undone, the completion of which must be accomplished to insure a material readiness for distant service.

3. This force is at present engaged as a primary mission in training, with an ultimate mission to fit itself for battle.

4. Reference (*b*) directs to that end it shall maintain a permanent nucleus battle organization of both officers and men sufficient to keep the material in constant readiness for battle and to permit rapid preparations for battle when battle complement is assigned.

5. These vessels are deficient in their material readiness for battle as indicated in the several reports submitted by them to which reference was made in above paragraph. Unless these repairs and alterations are made they will, when a battle complement is assigned not only be deficient from a point of view of material but they would at that time have to go to navy yards for these repairs and alterations which would occupy time of inestimable value which should be, and which reference (*b*) contemplates should be, directed to training the crew for battle.

6. In view of the very great military importance of this question, and to the serious results which might follow any misunderstanding on the part of the department in view of reference (*b*), as to the material readiness of these ships for action, I consider it my duty to bring the matter to your attention.

7. The question would appear to be one of policy to be decided by the department.

8. The list of necessary changes and alterations have been forwarded from time to time; it will require three months after these changes have been made to train a battle crew. This training can not be accomplished while ships are at a navy yard.

9. It is the object of this letter merely to present these facts in view of the expressed policy of the Chief of Naval Operations quoted above which clearly indicates an expectation that these ships can, on receipt of a battle complement, immediately begin definite battle training, as the primary mission.

10. If conditions permit it is recommended that in the order found necessary on a material inspection ships of this force be sent to navy yards to complete the repairs and alterations necessary to prepare them for distant service, so that when their services become necessary all of the time may be devoted to training their new crew for battle.

11. Reference (*c*) has been addressed to ships of this force for the purpose of obtaining full and complete lists of all work which will be necessary before being ordered on distant service. A copy thereof is forwarded herewith for information.

12. Upon receipt of these reports, material inspection of ships will be held as found necessary and a report forwarded covering all vessels of force 1.

A. W. GRANT.

On April 25, 1918, the commander in chief forwarded the letter through the Chief of Operations: First indorsement, "Forwarded, approved," as follows:

[First indorsement.]

File 1680.

APRIL 25, 1918.

From: Commander in chief.
To: Chief of Operations.
Subject: Preparing ships for distant service (letter of combat for one).
Reference (*a*) Secnav's letter No. Mat-T-M1 20778-246 of February 12, 1918, re Rhode Island. Request for repairs and inspection report.

1. Forwarded, approved.

2. Especial attention is invited to paragraphs 10 and 12 of the attached letter. As noted in previous correspondence concerning work necessary for distant service, the commander in chief recommends that such work be done as early as is practicable, in order to carry out the department's policy as expressed in reference (*a*).

H. T. MAYO.

Following the writing of this letter I interviewed personally the Chief of Operations and suggested the holding of a conference at the Navy Department. As a result, this conference was held, as directed in the following letter:

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
April 25, 1918.

From: Chief of Naval Operations.
To: Bureaus of Navigation, Steam Engineering, Construction and Repair, Ordnance; commander in chief, Atlantic Fleet; commander battleship force 1; commander battleship force 2; commandant navy yard, Boston; commandant navy yard, New York; commandant navy yard, Philadelphia; commandant navy yard, Norfolk.
Subject: Battleships—schedule of navy-yard work.

1. The present material condition of vessels of battleship forces 1 and 2 is believed to be in general very good; and this condition may be expected to be maintained. However, there has been an accumulation of authorized new installations and long deferred extensive repair work that must be undertaken to bring these vessels to their highest state of readiness for battle.

2. To undertake this work and carry it out most efficiently, a general estimate of the situation is necessary, in order to lay down a general plan and schedule of navy-yard work. There must be a definite list of work to be undertaken on each vessel. Preparation of plans and the assembly of material must be completed before the vessels are sent to the navy yards to begin the work.

3. It is desired that these matters be fully discussed in conference of officers representing the Office of Naval Operations and the material bureaus of the Navy Department, the United States Atlantic Fleet, and the navy yards, Boston, New York, Philadelphia, and Norfolk. The conference will be held at 9 a. m., Tuesday, May 7, 1918, in the office of operations—material, Navy Department. Officers to represent the navy yards and the fleet will be nominated upon receipt of this letter, and requests for orders will be submitted to the Bureau of Navigation.

4. It is of the greatest importance that officers attending the conference be fully prepared to comment on all matters presented for discussion.

W. S. BENSON.

On May 7, the commander of battleship force 1, met in conference at the Navy Department with representatives from the navy yards at Boston, New York, Philadelphia, Norfolk, Bureaus of Construction and Repair, Steam Engineering, Ordnance, and from the material section of the office of the Chief of Operations. So far as concerned repairs to vessels of battleship force 1, every item was considered and a time estimate for the completion of the work upon each vessel was made, and the order in which the vessels were to be received at the navy yards was tentatively decided upon.

The two following letters show the schedule for the overhaul of 10 battleships at the navy yard, Philadelphia, and 7 vessels at the navy yard, Boston.

3363-132-D.

UNITED STATES ATLANTIC FLEET,
U. S. S. "MINNESOTA," FLAGSHIP,
Base 2, May 12, 1918.

From: Commander, battleship force 1.
To: Commandant, navy yard, Philadelphia.
Subject: Tentative schedule for overhaul of vessels of battleship force 1.

1. The following table shows the tentative schedule for overhaul of vessels of this force arranged by the navy yard, Philadelphia, Pa., May 7, 1918, following conference at Navy Department:

Digitized by Google

Vessels of battleship force 1, home yard, Philadelphia, Pa.

Vessels.	Tentative schedule arranged by navy yard, Philadelphia, May 7, 1918.	Vessels.	Tentative schedule arranged by navy yard, Philadelphia, May 7, 1918.
Kansas	May 29–June 20.	Louisiana	July 31–Sept. 11.
New Hampshire	June 5–July 24.	Missouri	Sept. 2–Oct. 28.
Alabama	June 12–Aug. 1.	Maine	Sept. 9–Oct. 28.
Minnesota	June 12–Aug. 7.	Ohio	Sept. 16–Nov. 4.
Illinois	June 26–Aug. 14.	Wisconsin	Sept. 23–Oct. 31.

2. Upon returning to the fleet, and after consultation with the commander in chief, it is found necessary to request the yard to alter this schedule, principally in regard to time of arrival of vessels of this force at the navy yard. The following table shows the schedule, and comment is requested:

Proposed schedule of time for overhaul of vessels, submitted by commander battleship force 1, May 12, 1918, to commandant navy yard, Philadelphia.

Ship.	Number of working days.	Beginning and end of overhaul period.	Ship.	Number of working days.	Beginning and end of overhaul period.
New Hampshire	40	June 6–July 27.	Kansas	20	Sept. 9–Oct. 3.
Alabama	45	June 12–Aug. 8.	Maine	40	Sept. 18–Nov. 7.
Illinois	40	June 26–Aug. 16.	Minnesota	40	Oct. 1–Nov. 19.
Louisiana	35	July 26–Sept. 10.	Ohio	40	Oct. 5–Nov. 25.
Missouri	50	Sept. 2–Nov. 2.	Wisconsin	30	Oct. 23–Nov. 30.

3. The principal change appears with vessels of the fourth division, moving the *Kansas* and *Minnesota* to later dates.

(*a*) As it will be impossible to carry out departmental orders if we follow the dates submitted in the yard's schedule.

(*b*) It would also seem desirable to lengthen the interval between the time of arrival of vessels of any division at the yard. No change is made in the time for the arrival and departure of the *Alabama* and *Illinois*, vessels of division one.

4. In studying the list of repairs on the various vessels, I find that there is with each and every ship some one controlling item that limits the period of time that vessel will be at the yard undergoing overhaul, and it would seem at present that the result of my material inspection of these vessels will have the effect of possible reducing the volume of work on these vessels rather than shortening the overhaul period.

A. W. GRANT.

BOSTON NAVY YARD,
OFFICE OF THE COMMANDANT,
May 11, 1918.

From: Commandant navy yard, Boston, Mass.
To: Commander battleship force No. 1.
Subject: Battleship force No. 1, repairs.

1. As a result of conference at the department between representatives of this navy yard, of the various bureaus concerned, and of battleship force No. 1, the following schedule for repairs to battleships having Boston as home port, is submitted:

	Days required for repairs.
Georgia	45
Virginia	30
Nebraska	30
Rhode Island	30
New Jersey	30
Kearsargh	35
Kentucky	30

Digitized by Google

2. It is recommended that the *Georgia* arrive at this yard on June 5, 1918, and that the other vessels come here in the order named, each ship to arrive about 10 days before the date set for completion of the ship in precession.

W. R. RUSH.

[First indorsement.]

MAY 18, 1918.

From: Commander battleship force 1.
To: Commander in chief.

1. Forwarded.

A. W. GRANT.

These vessels required from 30 to 50 working days for necessary and urgent repairs to place them in condition for effective military service. An order from the department concerning repairs to battleship force 1 is quoted herewith:

NAVY DEPARTMENT,
Washington, June 8, 1918.

To: All bureaus; commander in chief, Atlantic Fleet; commander, battleship force 1; battleship force 2; commandant, navy yard, Boston, New York, Philadelphia, Norfolk.
Subject: Battleships, schedule of navy yard work.
References: (*a*) Commander in chief's letter No. 9–C1 (15/6), June 1, 1918.
(*b*) Departmental letter 28577–104, June 1, 1918.

1. The following repair schedule of battleship forces 1 and 2, submitted by the commander in chief in reference (*a*), is approved.

Ship.	Working days.	Period.	
		From—	To—
Vessels assigned to navy yard, Boston:			
Georgia	45	June 5	July 27.
Nebraska	30	July 26	Aug. 29.
Kearsarge	35	Aug. 8	Sept. 18.
Virginia	30	Sept. 3	Oct. 7.
Rhode Island	30	Sept. 23	Oct. 26.
New Jersey	30	Oct. 21	Nov. 23.
Kentucky	30	Oct. 23	Nov. 26.
Vessels assigned to navy yard, Philadelphia:			
New Hampshire	40	June 6	July 23.
South Carolina	30	June 7	July 12.
Alabama	45	June 12	Aug. 3.
Illinois	40	July 1	Aug. 16.
Louisiana	35	July 26	Sept. 5.
Michigan	30	Aug. 5	Sept. 9.
Connecticut	60	Sept. 1	Nov. 11.
Missouri	50	Sept. 2	Oct. 30.
Kansas	30	Sept. 9	Oct. 1.
Maine	40	Sept. 18	Nov. 2.
Minnesota	40	Oct. 1	Nov. 15.
Ohio	40	Oct. 22	Dec. 7.
Wisconsin	30	Nov. 4	Dec. 9.
Vermont	35	Nov. 18	Dec. 30.

JOSEPHUS DANIELS.

Most all of these estimated periods of time for completing the work were too short and had to be increased.
